It was no easy task to award premiums where there were so many claimants, and their claims whom they were precluded from awarding a prewere so just. The committee regretted that Mr. Benj. Harrington, of Princeton, had it not in his power to furnish the requisite certificate as to the quantity of milk given by his cow offered for premium, during the month of September. But as he could not she could not be considered as a subject for premium, whatever the committee might have thought, had such certificate been offered. She was a very fine animal, and the quantity of milk given by her in June, twenty-one quarts a day, shows how high her claims were upon the attention of the committee, and how strong kept at an equal cost. It is a deplorable want of they might have been upon them to award her a economy, and worse even than that of a man who premium. After due deliberation, the committee are quanimously of the opinion that the first pre-

dissolved, and the leaf falls." The reasonable- animals they examined, and did honor to the stock Henry Sprague, of Spencer, for his four years old cow, half Holderness breed. The quantity of milk Among the other cattle, there was exhibited by given by her, as certified, was twenty quarts of cow with calf, which weighs 1,663 pounds, and tieth day of June-and from that to the first of teen other cows.

The second premium of ten dollars the com-Europeans may say that nature degenerates in mittee award to J. L. Boylston, Esq. for his beauher productions in America, but while New Eng-tiful light red four years old cow, which produced land produces such animals for the slaughter as during the month of June, an average of nine have this day exhibited, we never need to fear pounds of butter per week, and during the month the want of good eating, or fear the imputation of of September, fourteen quarts of milk per day although kept with from twelve to twenty-one cows. There were the nucommon number of eighteen and only upon grass. She is of the native breed, milch cows entered for exhibition or premium, and her calf nine months old, a fine animal was

> The third premium of eight dollars, the commium.

> For the fourth premium Mr. Boylston was his thirteen quarts of milk per day during September. She was kept with from twelve to twenty-one cows during the season, and only upon grass. In ited in the number of their premiums, for where all deserve, it is difficult to discriminate.

If the committee have failed to notice any of the animals exhibited, in a proper manner, it arises entirely from their number, and the difficul-And having exhausted their epithets of approbaty which arises in such cases in discriminating distinctive traits. In the case of Mr. Harrington. the committee are so well persuaded of the merits of his cow which was exhibited for premium, to mium by the rules of the Society, that they respectfully suggest to the trustees the allowance to Mr. Harrington of his travelling fees according to the rules of the Society, it he does not receive them in respect to other animals exhibited by him. In addition to this, what some may deem dry detail, the committee beg leave to offer one or two remarks of a general character. They cannot but express their surprise, that any man will ever keep a poor milch cow when, as has this day been shown, animals so much more profitable can be should invest his money in two per cent. stock, when he might as safely receive ten per cent. on

a source of luxury to the poor and rich alike .-It is in this light that she is an extremely interesting object, for good eating comes home to us all. We have heard our brother farmers talk of "living like poor folks," when they had more luxuries in their dairies than they could dream of, till deprived of them. "Sir," said an obsequious waiter at a city hotel, to a good honest yeoman of a neighboring county, as he handed him a pitcher in your coffee ?"-"Yes," said he with a sigh, "a best eatables derive their origin from our milch cows. But the quality of the one depends upon that of the other. It is in vain that the housewife sets the milk if it is not of a rich quality. She may select her pans with the skill of an Humphrev Davy; but it matters not whether of tin, or earthen, or what not, for if the cream is not in the milk, she cannot get it out. S'e may warm it, or cool it, skim it or churn it all together; poor milk will make poor butter. All the patent churus that Connecticut ingenuity ever invented, or Dr. Thornton ever puzzled his brains over, could not make sky blue milk into yellow cream, or white frothy cream into hard sweet butter. Such milk and butter, some may think, may do for bired men and boarders, but when we think of one's children, (especially those of us who have none) this becomes a subject of grave consideration, since the raising and education of children have employed all sorts of talents from those of the school great desideratum, and that our cider may be imdame among her A B C's, up to a Brougham in the halls of Parliament. As a committee on milch cows, we would modestly suggest that theorists do not begin at the foundation of the matter. We believe a good deal in the blood and breed of animals, but do not attach so much importance to mere names as some have done. But when we "thin potations" as heartily as Jack Falstaff in the ly manifested by our annual exhibitions, must be play. We could quote even sacred writ in favor gratifying to the community. of milk diet, but we need only refer to the good old times of bread and milk suppers, when slops and nic-nacs were not the staff of life, and when the rich bloom of health on the cheek of child- lbs. each, from one vine. bood, like the brilliant bue of twilight on a summer's day, played around the features even of old There was great competition in flannels, carpets age, making it fresh and fair and vigorous. By order of the Committee,

EMORY WASHBURN-Chairman.

MIDDLESEX CATTLE SHOW.

The Society of Middlesex Husbandmen and Manufacturers held their anniversary Cattle Show the day brought together an unusual number of the rules of the society entitled to premiums. Ycom citizens and members.

Twenty teams were entered for the Ploughing Match; of which 17, viz. 9 single and 8 double. were found qualified by the rules of the Society to in lots of 1-9th of an acre each, was well swarded seventh vol. of the N. E. Farmer, a writer has in-

milch cow. She is a treasure to a poor man, and the Ploughmen. At 15 minutes after 9 o'clock 17 teams commenced the match, and the work was performed with a neatness and skill in execution, which has seldom, if ever, been equalled .-The discipline of the teams was admirable. There was no noise or whipping, and the teams all completed their work within 30 minutes, without exhibiting any appearance of fatigue. The procession of officers and members formed, and proceeded to the meeting-house, where prayers were ofof what city folks call cream, "do you like cream fered by Rev. James Howe of Pepperell, in a manner well adapted to the occasion, an able, useful, plaguey sight better than skim milk." Most of our and Jearned Address was delivered by the Rev. BERNARO WHITMAN of Waltham, and singing was performed by a select choir in a skilful manner.

After the exercises at the meeting-house, the Committees proceeded to the discharge of their respective duties. The working Oxen presented a most interesting exhibition. Twenty-one pairs were entered for premium, and their qualities were tested by drawing a load of 7000 weight. Many pairs exhibited great strength and docility, and the appearance and discipline of the oxen gave evidence of manifest improvement in that kind of

Two fine and superior specimens of eider were presented to the Society, one by Mr. John Cooke of Cambridge, the other by Mr. Jonathan Rice of Marlborough. Each specimen was very nice, and the preparation simple and of little expense. The Society was highly gratified to see a competition in exhibitions of this article. Good cider, is a proved to a superior degree, the specimens exhibited, give abundant evidence-no labor will be better rewarded, than that bestowed in the preparation of cider.

The pens, 60 in number, were all filled. The horses, neat stock, and swine, were considered superior to any heretofore exhibited. The gradual come to cating, we would foreswear, for children, improvement in neat stock in particular, so clear-

STAGGERS IN SWINE.

MR FESSENDEN-In the first number of the

so richly the charges of her keeping, as a good and well calculated for a fair trial of the skill of troduced the subject of the staggers in swine, and requests that it may be further investigated by those who profess any knowledge of the disease. I have been conversant with the disorder, it having repeatedly attacked my swine. In vol. iv. p. 88 of the same work, I gave some account of it. I then added that the pig which survived, was then, three weeks after the attack, as healthy as the others. I was probably led to this conclusion, from the greediness with which he devoored his food; but I soon found cause to regret the success of the surgical operations and medical treatment the poor animal endured. The expense of supporting it, I judged, was doubled in consequence of the disease. His growth was materially checked; and a gristly substance supplied the place of fat. I have lately conversed with a neighbor, who, at various times, has lost many of his swine by this disorder. His application was the depleting course by bleeding, and a powerful drench. Two only recovered. He stated the expense of keeping was more than any other two in his pens; and that their meat was of an ordinary quality, resembling rine. He expressed his determination never again to attempt their cure. This also is mine.

In J. P. De Grouchy's Letter to the late Judge Peters, published in vol. iii. page 396 of the N. E. Farmer, he remarks, that though by the method of cure he has adopted, he is much more successful; yet the pigs that recover do not thrive so well after such an attack. He mentions nothing of the quality of the pork, so noticeable in the instances above stated. The symptoms already indicate that bleeding is the best remedy. His recipe directs it. Those who can "see a bare knob in the roof of the mouth" may "cut it and let it bleed," according to his practice: those who cannot, may do well to make an jucision there as farriers bleed their horses. Should they swallow the blood, it may prove a sufficient cathartic. I have never searched for the" knob," believing no more of its existence as an indication of disease, than of the worms in the tongue, which many cut out to keep a favorite dog from running mad.

Yours, with great regard, Worcester, Oct. 9, 1828. O. FISKE.

We are glad to see that the late improvement contrived by Mr. Grieve has drawn forth the notice contained in the testimonial below. We heartily join in the concluding tribute to the intelligence, activity, and enterprize which have marked his exertions, and hope that prejudice will not thwart their proper influence .- . Vew. Herald.

Threshing Machine.

Ma. THAYER,-Having this day witnessed the operation of a machine for threshing and winnowing grain, invented by Mr. Wm. J. Grieve, at the Indiau Hill farm, in West Newbury, we send you this notice, that an invention so valuable may become known. The machine was worked by four borses, and in seventeen nanutes threshed and winnowed eighteen bushels of heavy oats, doing the work perfectly, threshing the straw clean, and separating completely the chaff, straw, and grain. To extensive grain-growing farms, this must prove a most valuable labor saving machine. Mr. G. removed from Scotland to this country more than a year since, and by his skill in farming, and implements of husbandry, promises to confer important benefits on our agriculture.

JOHN VARNUM, J. H. DUNCAN.

ENGLISH CATTLE MARKET.

By the authority of the British Parliament, an ex amination has been made into the state of the cattle markets in the vicinity of London. The evidence given before the committee-represents the hardly could, when one of the slaughtermen be-Smithfield were wet with the blood of slaughtered animals, and the offal was left in the gutters to the operation of the sun, producing the most horrible much meat was sold, which was unfit for eating; into the market with one of their fore legs tied up to prevent their running away, and when thus disabled, the animals were goaded on by the inhuman drovers.

The state of Leadenhall market is thus describdreds of other places within the precincts of the city:-

the slaughter-houses are underneath. You descend a flight of steps several feet, (perhaps twenty feet) and you go into a dismal dungcon which same witness, in which the animal received seventhe place that you enter-and around the floer of before it dropped. This gentleman was a memthis place, covered with blood and filth and gar- ber of the college of surgeons, and his opinion ployed to slaughter in these underground cellars with a very large knife, I consider to be the easiseen them slaughter the sheep, and prepare the ed with a great deal of trouble and cruelty." carcase with a horrid filthy bucket, containing Driving cattle into the market was represented

Merely sheep were slaughtered there, no cattle; scenes .- Courier. they slide them down trap doors, and I have seen them frequently so crippled as not to be able to stand when they 'ave reached the bottom, frequently with their jaws or legs broken.

The manner in which the cattle are slaughtered in most of the slaughter-houses is inconceivably dreadful and horrible. The cattle are sent to some of the large slaughter-houses to be slaughtered by slaughtermen employed by the man who keeps the premises; he takes in the cattle, and receives so much a head for their being slaughtered; he appoints a certain number of men, who are generally of the lowest possible description, to slanghter the cattle, and this business they perform without any observation or remenstrance or direction from the master butcher, or the man that owns the premises, or any one else, and they do it in any bungling cruel manner they choose to adopt. I saw an instance at the time I refer to, which was so dreadful it will never be effaced from my recollection, and I was not a solitary eve-witness, but other gentlemen were present. At Whitechapel, one of the bullocks was drawn up to the stake to be slaughtered, and when stand-

SILK.

There is scarcely a day passes that does not bring us an account of some successful experiment in raising silk, in the South and West. The Ohio State Gazette notices a specimen of silk, of an excellent quality, made by Mrs. Daniel Parker, of Clermont county, in that State.-A day or two since, we received information of the success of an experiment made by Dr. M. W. Alexander, of tleman raised two crops last summer, the last of which was superior to the first .- Another gentleman in the same State was very successful in raising siik, and contemplates entering into the business on an extensive scale. Indeed we have inobtain a mulberry orchard that will yield leaves

ing at the stake they are in the habit of fastening lands are admirably adapted to the growth of mulberry trees. Will not the farmers of the east-

WHEAT PRODUCED IN FRANCE.

At a recent meeting of the Academy of Sciences in Paris, the Secretary read a paper on the " present and former produce of wheat in France," from which it appears that forty years ago the amount of wheat annually grown in France was sufficient (reckoning the population at that time at 25 millions, from which five millions are to be deducted for children under ten years of age,) to give to each person 583 lbs. of wheat per annum, or one pound nine ounces of bread daily, after taking away the wheat necessary for seed for the ensuing year. The population since the period here referred to, has increased to thirty-five millions, but there has been no increase in the wheat produce; from which it is inferred that the land brought into cultivation since the Revolution, has been chiefly laid out for vineyards, leguminous plants, and potates.

IMPORTANT INVENTION.

We this morning examined and saw in operation a most ingenious and valuable machine for spinning flax and hemp, invented by Dr Bell and Mr Dyer, two intelligent and highly respectable gentlemen from New England. They entered upon the prosecution of their plans last winter, and have now brought them to a successful termination. As the patent has not been secured, we are not permitted to give a full description of the invention; but the following particulars will be interesting to our readers, especially to those who wish well to the cause of American Manufactures.

This machine is constructed on an entirely new principle, having no analogy to the process for the cotton, woollen, worsted, or other manufacture .by competent judges, to surpass other linen yarns in as great a proportion as cotton or woollen yarns spun by the present improved machinery, used in the manufacture of cordage. In the degree of velocity, its operation is limited only by the quickness which the spindles and fliers are capable of supporting. The instrument now in operation produces about the same quantity of thread per spindle, fineness being equal, as the throstle spindles in the cotton manufacture. The whele formation of the thread from dressed flax is completed at one operation. The material laid on the machine is wound upon the spools ready Mecklenburg county, North Carolina. This gensistance; the whole being effected by the retary motion communicated from drums. Indeed, all the motions of the instrument are of a circular kind .- N. Y. State man.

For fattening swine .- Wash potatos clean, boil formation from several of the southern and west- and mash while hot-mix in at the same time ern States, of the extensive commencement of oats and pea meal. Put the mixture into a large white mulberry planting with the same view. Te tub, which must stand till it becomes sour but not putrid. Keep a quantity of this on hand, always enough for the most extensive establishment, fermenting and give it to your hogs as often as would not require more expense or trouble than they will cat. It is said that pork may be fattenevery farmer bestows upon a common apple orch- ed in this way and make a saving of one third of ard; and what is better? At 1 o'clock, the Society and citizens were escorted sic, where after prayer by Rev. Mr. Crosby, and a report of the awarding committees were read by Gen. William Carey of Lempster.

The officers of the Society for the ensuing year

are the following.

AARON HODSKINS of Walpole, President, Salma Hale of Keene, Vice President, Elijah Bingham of Alstead, Secretary and Librarian.

Leonard Bisco of Walpole, Treasurer, David Parker of Charlestown, Daniel Robinson of Acworth, Elijah Belding of Swanzey, James Chandler of Alstead, Levi Chamberlain of Fitzwilliam, Alvalı Stevens of Claremout, Samuel Tutherly of Unity, William Jennison of Walpole, Executive Committee.

POTATOS.

The crop of Potatos, in this vicinity, is below the average, and the quality generally, very indifferent. It is, therefore, of some amportance that care should be taken to have toem well preserved after harvesting, or they will become so poor before spring as to be of little value for cooking. The Luncuster Gazette says, "the best method should be resorted to of keeping them ary." This, we believe, is a mistake, and trust that no farmer will be induced to adopt it. Potatos do best when they are kept about the natural gampness of the earth, and excluded enurely from the air. The best mode of preserving them that we have ever seen adopted, was to pack them in light loam or sand, in bins or casks, without drying either the potatos or the earth in which they were packed. When so kept, they cook as well in the spring as when first dug. They should be picked as fast as they are dug, as it is found that two or three hours' drying, only, essentially injures them. It is well known that potatos which grow in a strong and rather moist loam, are better than those which are raised on a light or dry soil .- Massachusetts Spy.

To remove the musty flavor from wheat which has been damaged .- An English receipt book directs as follows: For every bushel of wheat take two cine, that he has succeeded invariably in recoverpounds of potash, dissolve it in water with about ing drowned animals, by the following galvanie pure water, and dried quickly.

Banks, it is observed, "if wheat be musty, it must be put into any convenient vessel, capable of containing at least three times the quantity, and the will float) may be removed. When the water has respiration is ultimately effected.

Farmers ought to profit protected tree seemed to be proof against the efby this information, and either sow their wheat fect of the frost; and I do not exaggerate when I earlier than in years past, or sow winter wheat in say that the crop was beyond all tormer precedent, and was the admiration of all who saw itmany of the branches being literally loaded like ropes of onions."

WORCESTER CATTLE SHOW.

The annual Cattle Show, Ploughing Match, and pleasant-the concourse of people greater than ever-the number of animals much larger than sion, manifestly greater than that of any former year. Delegations were present from the Massachusetts Agricultural Society, from the Wiudham County (Conn.) Agricultural Society, and we believe, from other Societies.

At an early hour the gathering round the pens

The Ploughing Match was at nine o'clock. At Address was delivered by W. S. Hastings Esq. of Mendon, to a crowded audience. The President patience of the cultivator in its early stages. The These were the highly valued gifts of Sir Isaac of the Society, Gov. Lincoln, then briefly addressed the members for the purpose of giving the usual general statement of the condition of the Society. By this statement it appeared that the tains more than two or three feet in height. In cies were exhibited by S. Dudley of Sutton, J. number of members is about 800, and the amount the fifth season its stature is doubled. At this Mackay, Boston, Jos. Barrett, Concord. of the permanent funds, \$5000. Large as the period it grows with the vigor and rapidity of number of members appears to be, it is small compared with the population of the County, which is about 80,000; and the President very pertinently appealed to the members, and to the citizens gen usefulness of the Society, by cularging the number of its members. The names of the various committees were hen announced, by Gov. Lincolnthe Chairman being designated solely for the purpose of assisting the Committees in drafting their Reports, having no voice in awarding the premiums unless in case of an equal division of the members .- Worcester Yeoman.

We have not room, this week, for further sketches of the proceedings, which appeared to emanate from "The Heart" [of the Commonwealth] and reach and exhibitante the hearts of the large and respectable assemblage collected on this joyous and interesting occasion .- One of the Reports will be found in this week's paper.

HORSE CHESNUT.

MR FESSENDEN-You will allow me to add an appendix to your note upon Mr Jenkins's inquiry respecting the best method of cultivation of the horse chesnut.

For some years I took various means to obtain the vegetation of the nut, but without success .--The last parcel I planted without effect, I emp-I accidentally, and very fortunately left one. It was in leaf when I first discovered it. By a careful removal to a favorable soil it has become a fine bearing tree. All the rest perished as heretofore. Since this discovery I have not found the least difficulty. I endeavor to imitate nature in her planting the seeds of the ferest.

Soon after the nuts are gathered, not allowing them to become dry, I make a slight excavation by the side of some bank, in my garden and spread them in, levelling them nearly with the surface. Care should be taken to lay the side from whence the root issues next to the earth.-This posture gives the root a more speedy access to nourishment, and facilitates the exit of the stem. I then cover them with leaves or some light rubbish, and replace as much earth as is necessary to keep the covering in place. By the time the ground is ready to receive them in the spring, I find them sprouted without the loss of one in a hundred. To disengage them from the carth, after removing the covering, I pass a stable fork under the mass, and gently pry them up, taking the out nuts singly and carefully, to prevent breaking the long tender root, and transplant them in trenches. In this process I make the holes with a trowel, deeper than the extent of the root. After partially filling them with light earth, I draw up the nut to within about an inch of the surface, leaving it just buried beneath it. I generally take them up the second year, and cut off the tap root, that they may be removed with more ease and safety when large enough to be transplanted from the nursery.

annual growth is finished about the last of June Coffin. when other trees are in their most vigorous progress. In the three or four first years it rarely at- the points which indicate fine animals of that spe-

I have been more particular as your correspondent has not been fortunate enough to acquire about 30 head of stock of excellent quality exhibany practical knowledge on this subject. From ited, by John L. Boylston, Esq. of Princeton.erally to augment the funds and thus increase the their incipient tardy growth, I trust he will not despair of seeing a nut planted by his own hand, become, in perfection, what he justly "esteems fine animals, owned by J. Estabrook, Esq. of more than any other ornamental tree."

Respectfully your friend and serv't, Worcester, Oct. 9, 1828. O. FISKE.

ERROR CORRECTED.

MR FESSENDEN-I observe in your paper of September 19, No. 9, page 70, you tell the public the Trustees of Mass. Society for the Promotion of Agriculture, had offered a premium of fifty dollars, for the best, and an effectual method of destroying the Locust Borer. You will perceive by bury. A. Wyman, Roxbury. J. Goulding, of the premium list published by Mr Russell, that the Sherburne. I. Farwell, Waltham. J. W. Goodpremium offered is ONE HUNDRED DOLLARS; and as your paper is considered good authority, (and deservedly so) will thank you to correct the error. Respectfully your obedient servant.

GORIIAM PARSONS.

Brighton, October, 9, 1828.

IF We are much obliged to Mr Parsons for pointing out the error specified above. It originated in our mistaking the premium offered for the tied on the grass until I was ready to institute best Plantation of Locust Trees, &c. which is fifsome other scientific process. In planting them, ty dollars, for that offered for a mode of extirpating in the number of the articles. Several beautiful the worm that attacks the Locust Tree, which is one hundred dollars .- Editor.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 17, 1828.

BRIGHTON CATTLE SHOW AND FAIR.

The annual exhibition of Cattle and Manufactures, &c. was holden at Brighton on the 15th inst. The day was cold beyond any recollected precedent, at this season of the year. The inclemency of the weather, however, did not prevent a numerous concourse from assembling, and was not sufficient to chill the ardor for improvement which animates our Cultivators, Manufacturers, Connoisseurs and Amateurs of useful arts and new inventions which promise to minister to the necessities, and add to the conveniences of mankind. We shall be able, at present, to give but brief notices of the memorable things which were exhibited, but must refer our readers to the Reports of the several Committees of the Mass. Ag. Soc.

The pens were 80 in number, and all filled with animals which may well be estimated as prime specimens of excellence, and respectively entitled to a standing at or near the head of their species,

THE PLOUGHING MATCH was ably contested by nine double and ten single teams. One eighth of an acre was staked out for each plough, and each lot was finished within 50 minutes, the time allotted by the Committee.

Horses. Three English horses were exhibit-This tree is peculiar in its process, taxing the ed, Barcfoot, Serab, and the Cleaveland Bay.— 84.

Swine of superior shape, and perfect in all

Live Stock .- The exhibition in this department was superior to what we have ever before witnessed at Brighton. We observed in the pens One of his grass fed oxen not very fat weighed 2310 lbs. There were six pens filled with very Athol. An ox, owned by Mr B. Harrington, weighed 2500 lbs. One sent by Mr S. Towne, of Charlton, weighed 2237 lbs. An uncommonly large one from Mr N. Slade, of Somerset. Several from J. W. Watson, of Princeton. J. Whiting of Princeton. S. Hastings, Princeton. B. Atwood, Barre. J. Robbins, Watertown. Fine Heifers from A. D. Williams, of Roxbury. Capt. D. Chandler, Lexington. A superior one from Z. Cook, Jr. Esq. Dorchester. B. P. Williams, Roxrich, Roxbury. E. Sparhawk, of Brighton. Several fine animals from the stock of the Hon John Welles, Dorchester, added much to the interest of the Show.

SHEEP-A number of fine Merino Bucks and Ewes, from G M Barrett, Concord-Jas Barrett, Concord-R Rogers, Newbury-W Williams,

Manufactures .- These were less extensive than they have been at former periods. The deficiency, however, was not in the excellence, but specimens of SILK, imported from Italy, (the same which have been left for inspection at the Farmer office) were exhibited and presented to the Society by J. M. Gourgas-Cotton and linen Diaper and linen Sheeting by Mrs Hannah Ranger and Mrs. Hunter of New Bramtree-linen diaper by a lady of Greenfield-a fancy straw bonnet by Elizabeth Bryant, Worcester-3 Turkey down tippets by Cynthia Thayer-Beautiful grass and straw bonnets and hats for ladies by Lydia T. Pone, Milford N. C. Atwood, Dighton, and Chastanee Sanderson Shirley-specimens of linen thread, shoe thread and cotton bagging, by the N. E. Mannfacturing company at Grafton-2 beautiful bonnets made of the down of the milkweed-very fine woolen hose by Sophia Arms, Greenfield-several elegant rage manufactured by John Doggett & Co. Bostonrug by Jane Adams of Dorchester, aged 70 years Brass and steel patent reeds for weavers, exhibited by Messrs. Wilkinsons of Providence.

In a pyramidal case were exhibited a great number of beautiful fabrics, too numerous to specify in this article. There were also some split sheen-skins by Uriah H. Boyden of Cambridge.

In another part of the Itali was a collection of black and blue Broadcloths and Cassimeres from Watertown, Dudley, and Northampton, which appeared quite equal to any imported. There were likewise carpetings, flannels, rose blankets, &c.

Ploughing Match. The Committee on ploughs with two yoke of oxen, awarded the first premium of \$15 to Silas Dudley owner of the plough, himself ploughman, \$8, and W. B. Harrington, driver. ploughman, \$5, and L. Smith, driver, \$3.

3d, J. Dudley, plough \$6, himself ploughman,

\$3, Arnold Allen, driver, 2.

The Committee on ploughs with one yoke reported that 10 ploughs started, and the work in general was very good. They awarded the first premium to Geo. M. Barrett, Concord, \$15, to the ploughman 8, and the driver 4.

2d, to Otis Merriam, Concord, a lad, \$10, himself as ploughman, 5, and as driver, 3.

3d, to Prescott Barrett, Concord, \$6, himself as ploughmau, 3, and as driver, 2.

Fat cattle. First premium to B. Harrington, Princeton, fat ox, Holderness breed, weight 2500 pounds, \$25.

2d premium for fat ox, S. Towne, of Charlton, Holderness breed, weight 2237 lbs. \$20.

3d premium, N. Slade, Somerset, fat ox, weight 2315 pounds, \$10.

Bulls. First premium to Ichab. Stow, of Stow for a bull 2 years 6 months old, weight 1800 pounds, \$30.

2d, to L. Brigham, Cambridge, for a bull 2 yrs. 5 months old, \$20.

3d, to B. P. Williams, Roxbury, for a bull 13 months old, \$10.

Bull calves. First premium to B. Harrington, for calf of Holderness breed, 6 and a half months. \$15. 2d, J.L. Boylston, Princeton, 5 months \$15. 3d, N. D. Vose, Boston, \$5.

Milch cows. First premium to Wm. Osborn, jr. of Salem, \$30. 2d, to B. Harrington, Princeton, \$20. 3d, to J. L. Boylston, Princeton, \$15.

Heifers, having had calves. First premium to I. Robbins, Watertown, \$15. 2d, to John Goulding, Sherburne, \$10.

Young heifers. First premium to J. L. Boylston, \$12. 2d, Henry Craft, Newton, \$10. 3d, Daniel Chandler, Lexington, \$8. 4th, Zebedee Cook, jr. Dorchester \$6.

Sheep and Swine. The committee on Merino Sheep, and Swine, did not find any merino buck entitled to premium. They awarded the 2d to G. M. Barrett, Concerd. \$10.

For Ewes, the 1st premium to Joseph Barrett,

For Swine, 1st premium to John Mackay, for best Boar \$12; and 2d to Silas Dudley 8. First premium for best sow, to John Mackay \$12. 2d to G. M. Barrett, \$8.

Manufactures. First premium on Broadeloths to Sater & Howard, Dudley, \$20. 2d, to James

M. Robbins, Watertown, \$15.

For Flannels, 1st premium to Mrs. Jonathan Wilcox, New Braintree, \$10. 2d, to Sally Bancroft, Pepperell, \$7

Floor Carpenting, 1st premium to Zillah Davis, Holden, \$15 2d, to Mary Barrett, Concord, \$7

Stair Carpeting, 1st premium to Eunice Jaques Newbury, \$10. 2d, to Theresa H Thayer, Greenfield, \$7.

Blankets, 1st premium, to Mrs. James G Bryant, Oakham, \$6 2d, to Eunice Jaques, Newbury,

Linen Sheeting, first premium, to Mrs J. Hunter, New Braintree, \$8-2d, to Mrs Job Ranger, New Braintree, \$4-Linen Diaper, 2nd premium, to Mrs Cynthia Thayer, Greenfield, \$3.

Several premiums were also awarded for rugs, lace, and needle work, and fancy articles.

Useful inventions. The Committee awarded to

2d, Loring Smith, plough \$10, B. Seaver, Filler, a premium of \$5-and for an improved mode of stacking Hay, another premium of \$5 .-To George Coolidge of Watertown, a premium of \$12, for a rail-road and canal earth-eart. - A gratuity of \$12 was awarded to J. R. Newell, of Boston, for an improved Cider Mill.

> The Committee on Working Cattle had not reported at the time the other premiums were declared.

The sentiments given at the Society's Dinner, and other proceedings, requiring further notice, are unavoidably deferred to our next.

The noble animal of the Holderness breed presented to the Massachusetts Agricultural Society, by the liberal Sir Isaac Coffin, was sometime since sold at auction by direction of the trustees, and purchased by Hon. John Welles of Boston. Mr Welles has recently presented the "Admiral" to the Worcester Agricultural Society. Soon after his arrival he was reported by Dr Fiske to have contracted the gout, from the hardness of the roads on his journey, and to be "sick a bed." By the great skill and care of the attending physician, he has become convalescent, and although not able to make his appearance at Cattle Show, is fast regaining health and weight .-- Warces. Ægis.

The Thames tunnel is said to be entirely at a stand, little more than one tenth of the necessary sum having been subscribed.

Grape Vines.

The subscriber offers for sale Grape Vines of several varietie the produce of his garden in Durchester; among them are the

g:		
1sabella	White Musca	a t
Sweetwater	Black Hamb	ourg
Black Cape	Elba	. 0
Queen '	Muscatel	Muscate
Eurly Oval	Alexander's	
own principally of one way	-11	

They are principally of one year's growth, planted under h direction and superintendance, are warranted genuine, and a in a healthful and vigorous state.

The subscriber proposes to continue the cultivation of such varieties of the foreign and native vines as are suited to this climat and that will thrive in the open ground in town or country. Application may be made to the subscriber, at his office, Not 1-2 Congress Street, or at the Garden, to Patrick Kenoedy, Boston, Oct. 3, 1828. ZEBEDEE COOK, Jr.

New England Farmer's Almanack, for 1829.

New England Farmer's Attnanack, for 18239.

In press at the New England Farmer office, and will be published to morrow, the New England Farmer's Administry 1829. By Thomas G. Fessentien. Editor of the New England Farmer. —For sale, wholesale and retail, at the N. E. Farmer office, No. 92. North Market street, by Bowles & Dearborn, 50 Washington street, and by the booksellers and traders generally Some copies interleaved with writing paper, which who be very serviceable to farmers, will be kept for retail at the Farmer office.

Flower Seeds.

Just received at the New England Farmer Secd Store, No

52 North Market Street,
A fine assortment of Flower Seeds, comprising all the mos
fashionable and splendid varieties, raised this season at Pepper ell, Ms. expressly for this Establishment, neatly put up in papers, 6 cts. per paper, \$5 per hundred, warranted; a libera discount to traders.

Fruit Trees.

WM PRINCE, the Proprietor of the Lionæa Bortanic Gardeo and Nurseries at Flushing. Long Botsaic Gardeo aod Nurseries at £insting. Long lisland, bas the pleasure of inforoning the publick that his Nursery now contains 172 varieties of the Apple, 202 do. of the pear, 76 do. of Cherries, 139 do. of Pluens 25 do. of Apricots, 84 do. of Peaches, 29 do. of Nectarines, 16 do. of Almonds, 14 do. of Mulberries, 6 do. of Quinces, 16 do. of Figs, 16 do. of Currans, 15 do. of Raspberries, 77 do. of tooseberries, 20 do. of Strawberries, 257 do. of Grapes, 600 do. of Currans, 257 do. of Strawberries, 257 do. of Stra of Ornamental Trees, &c. Above five hundred of the above hinds of Fruits are not to be found in any other collection in A merica. The different varieties cannot be otherwise than genus ine, as the greatest attention is paid, and nearly all the kind are inoculated from bearing trees. The Cherry, Peach, an other Trees, are, generally of a large size. Catalogues may be obtained of J.R. Newell, at the Agricultural Warehouse No J. Mears, of Dorchester, for an improved Sausage 52 North Market-street, gratis; and orders left there, or sent by mail, will meet prompt attention.

Oct. 3

SUBSCRIPTION

For importing Grope Vine Rook from Fronce, at a moderate pine, and encouriging the introduction of that culture into the latted States.

Mr Alphonse Loubat, having considerably enlarged his Vine-

art Appiones deuceat, naving considerably enlarged his Vire-yard, on Long Island, where he now has, in till cultivation, turty-five access of ground, containing 72,660 Grape. Vine Roots; having also the peculiar advantage of heing enabled to produce the best spectimens of roots from its lather's extensive ymay are an uniform to the districts of Bordeleis, Gerac, and Buret, departments of firmule and Lot and Garonne, in France, 137 N. Lat.] proposes to the numerous trends to the cultivation of the grape vine in the United States, a subscription with the opened on the first of August, 1823.

Mr A. L. will engage to fornish subscribers with the Grape-Vine Roots, before me lirst of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be enrefully classed and packed to boxes, with some of the original sail in which they have been aised, which will greatly facilitate the thriving of the roots,

when transplanted.

Orders will be punctually attended to: the subscribers designated. nating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12.1-2 cents for each root; for less than 1600, at the rate of 15 cents; and 125 cents per root for less than 50.— Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 1; 1; 2; cents for less than one 1; and 13 cents for less than 50 roots.—Payment to be made on delix-

B cents for less than 50 roots.—Payment to be nade on delivery of the roots.—Letters not received unless post paid.
Subscription lists are open at New York, with Alphonse Louding, Subscription lists are open at New York, with Alphonse Louding, Wall street:—Poston, E. Copelaod, Jr.—Albany, R. M'Michael—Philadelpina, Van Amringe—Baltimore, Willard Rhoads.—Washington City, Win Pairo.—Richmond, Davenport, Allen & Co.—Savannah, Hall, Shapter & Tupper—New Orleans, Foster & Hutton—Charleston, (S. C.) J. & J. Street & Co., MA. Londaris book on the Culture of the Grape Vinemand on the Making of Wine, may be found at the principal book, sellers of the United Tattes; and his accepts will bravish them selfers of the United Flates; and his agents will turnish them gratis to subscribers.

MISCELLANIES.

London gas and the Thames fishermen .- In consequence of successive complaints of the fishermen against the gas manufactories in London, it has sheep. It is of the greatest importance to farmbeen ascertained, that the trade of the former is completely ruined, by the destruction of the fish from the drain of the noxious matter from the gas works into the rivers. Before the pollution of the water, there were taken daily 3000 salmon, 50,000 smelts, and other fish in proportion. This season there has been only one solitary salmon caught in little hope of their escaping its ravages. It is said the Thames, and that down at Woolwich. Formerly, four hundred fishermen found support for the moment they are discovered to be infected .their families in these fisheries. There are heavy penalties for discharging the refuse of gas into the river, which have in several cases been imposed. But as there appears to be no easier way of getting rid of the offensive matter, although the fish in the river will be entirely destroyed by it, it is supposed the gas companies will indemnify the fishermen, in some measure, for the loss of their business .- N. Y. Statesman.

A paper from Georgetown, D. C. says, "since the passage of the Canal bill, and the subsequent commencement of the great work, our town bas been gradually increasing. Property has been greatly enhanced, and rents have advanced from twenty-five to fifty per cent."

Remarkable fact .- A gentleman of this village, planted an apple tree last spring which has bloscomed four successive times, and produced two successive crops of fruit. The first blossoming was at the usual time, when the apple trees put forth in the spring but produced nothing. The second blossoming was about a month after the first, which we last week saw upon the tree. The third blossoning was about a mouth after the second, and also produced fruit, which is now on the tree. The fourth blossoming was last week, and we saw fresh blossoms on the tree on Thursday last, which promise fruit, unless the buds be nipped by the frost. The apples from the second blossoms are about the size of a small walnut and are not ripe. The third crop are smaller and straight and small, being about an inch and a half period, will be sufficient to communicate an exsomewhat shrivelled. The trunk of the tree is through, a foot from the ground, and is about cellent raspberry flavor. twelve feet high. It stands on the side of a hill, with a southern exposure. The fruit and blossoms come from a single stock, no scions or buds bottom level with the surface .- Gard. Mag. having been inserted in the tree. We have heard of trees putting forth two sets of blossoms, but never four successive blossomings, two of which produced fruit. Phenomena of this kind are frolics of nature, and to be accounted for, probably, on the supposition of an irregular, or diseased action of the juices of the tree. - Lyons (N. Y.) Ad.

To kill Moles and Mice .- Take one fourth of a used in hospitals, and as food for children. pound of maize, one ounce verdigris, 3 ounces of quicklime, 12 crawfish, a quarter of a pound of the proper time-keep every thing in its proper lavender; pound and mix all well together into a paste, to which add a little river water; make up pills about the size of a nut, and lay them in the way of the moles and mice.

Mortar improved by a mixture of Potalos .- It is stated in the Bull. Univ. that M. Cadet-de-Vaux has found mortar, of lime and sand, and also that a mixture of boiled potates.

Foot-rot .- This terrible disease has made its appearance in several parts of the State, and has ruined some of the finest flocks. Its origin has been traced in nearly all cases, to imported Saxony ers interested in this branch of husbandry, to be vigilant in checking the progress of this disease. We advise those whose flocks are healthy, to beware of buying or mixing with their sheep, those that they are not certain are equally sound; as when it is once introduced into a flock, there is the diseased should be separated from the sound, Vermont paper.

Damaged hay .- In the year 1789, which, like the present year, was remarkable for the quantity of rain which fell during the hay season, the farmers suffered great loss from the thousands of heads of cattle which perished from eating damp hay. This fact ought to put farmers on the guard against any similar effects at the present time.—

The efficacy of salt in curing hay is now almost universally known; but the best advice, perhaps, which can be given, is to be be careful as to the discovery of the proof of the proof of the proof of the present time.—

Floating lids are recommeded by a German economist, (M. Franzins,) to be employed in the case of common beer barrels; since, by sinking, as the liquor is drawn off, they will preserve the beer as effectually as if the cask were constantly full.

Dishley twins .- On the 20th of July, 1828, Mr. Lemuel Hayward, of Pomfret, Conn. killed a pair of three quarter Dishley twin lambs, which were yeaned February 10th, 1828: the carcase of one weighed forty-six pounds, and that of the other forty-nine pounds. They belonged to a flock which had received no extra keeping. He killed several pairs of twins, which weighed nearly as much as the above. - Communicated.

Raspberry wine .- If an attempt be made to form wine from raspberries and sugar, a liquor will be produced with but little if any of the flavor of the fruit; but a small quantity of juice of raspberries added at the decline of the fermentation, or a little fresh fruit suspended in the cask at the same

Potato and Tree Onions.

Also, a supply of Potato and Tree Onions. The Potato Onion Also, a supply of Potato and Tree Onions. The Potato Onion has proved a fine acquisition to the list of vegetables raised in this country, and is getting into general use in the Middle States. They have produced 12 and even 20 fold in this vicinity the past season; come much earlier than the common, are midder, and more sure of producing a crop. Price 6 cents each, 50 cts. per dazen.

Indian Corn.

Several varieties of Field Corn, selected with great care, for its earliness and productive quality—also Early Sweet and the Early Jefferson Corn, for the table.

Garden and Field Seeds.

The largest collection advariety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c will be published in the corresponding to the properties and forwarded gratis to any one ed in the course of a fortnight, and forwarded gratis to any one who will send for it.

Splendid Bulbous Roots.

Auctioneers, Samuel F. Coolidge Joseph L. Cunningham.

The Committee consisting of E. H. DERBY, Deacon ELIJAH COREY, and ELIJAH PERRY ESQR'S. on the Ploughing Match, with one yoke of oxen: Report-

There were twelve entries for ploughing, and only ten lots of ground; your Committee regret

Mr. Barrett, and Mr. Merriam, of Concord.

They award the premiums as follows:

1st to Geo. M. Barrett, of Concord, \$15 00 the ploughman, 8.00 the driver, 4 00 \$27 00

\$2d to Otis Merriam, of Concord (a lad) \$10 00 same as ploughman, 5.00 same as driver, 3 00

\$18 00 3d to Prescott Barrett, of Concord, \$6 00 some as ploughman, same as driver, 2 00

> \$11 00 E. H. DERBY,-Per Order.

The Committee on the Ploughing Motch with two yoke of oxen, REPORT-That out of twelve teams that were entered, nine appeared on the ground, and took their stations according to their entries, as follows.

No. 12 Silas Dudley, of Sutton,

13 Joseph Dudley 14 Luther Whiting

" 15 Sherman Barrett, of Concord,

16 John L. Boylston, of Princeton,

17 Luke Fiske, of Waltham, 18 Joseph Dakin, of Mansfield,

19 Perley Tapley, of Danvers, " 20 Loring Smith, do.

The ground allotted was on the side of a hill, very hard, and many rocks and trees in it. The lots contained one eighth of an acre each. The ploughmen were directed to use great pains, as goodness of work, would be the criterion in deciding, and ample time was allowed for the task .-The ploughmen showed much skill, and the cattle were generally very fine. Among so much good work (considering the nature of the soil) they found some difficulty in deciding on the second and third premiums-but have been unanimous in their decisions, and award the

\$15 1st premium to Silas Dudley to do. as ploughman W. B. Harrington, driver 4 - 272d premium Loring Smith, 10 B. Seaver, ploughman, õ Z. Smith, driver, 3. 3d premium Joseph Dudley, do. ploughman, 3 A. Allen, driver, 2-11

thirds of the ploughs were of the improved Cast Iron, which they are fully convinced are the most

being obliged to exclude two of the competitors plough (which is the most important implement in agriculture) and the introduction of cast iron ones, The ploughs all but two were of the improved the American farmers are indebted to the Ploughkind with east iron mould boards, and the plough-ling Matches; and which were first introduced in ing generally met the approbation of the judges. America by the Massachusetts Society for Promoting Agriculture. They much regretted that the lots were of so small a size.

JOHN PRINCE. Committee. EBEN. HEATH, JOSEPH CURTIS.

Brighton, Oct. 15, 1828.

The Committee on Agricultural Inventions report as follows:

JOHN MEARS of Dorchester produced the model of a roof for the better securing hay in stack; it consists of a kind of rough or shed roof, made of joist six or eight feet apart, and covered with boards lapping about three inches, and nailed securely to the joist, the edges of the boards nailed and drawn close so as to keep out the water effeetually; the width and length of roof as may he most couvenient. The roof is attached to the barn, or any suitable building, by three hinges on the ends of the joist, which fasten to a small timber or large joist, attached to the huilding horizontally; a post is placed at each of the front corners of the roof, and by ropes passing over shieves or pullies through a mortice in the tops of the posts, is hoisted or lowered as occasion requires. Hay may be defended from the weather much better by this apparatus, than by the ordinary mode of sacking; it can be moved or stacked more expeditiously, and removed in part at different times, without leaving what remains exposed to the weather; it is not costly, and will form a useful shelter in summer, when not wanted for bay, for earts, ploughs, and many implements of husbandry, which are too frequently exposed to rains and a hot sun. Mr Mears produced certificates of its utility the present season from farmers in his neighborhood. For the invention the Committee award Mr Mears a premium of five dollars.

JOHN HOUGHTON, of Lynn, presented for premium an apparatus for destroying grubs as they ascend apple trees. It consists of a trough formed of coarse paste board covered with canvass. the whole coated with a resinous substance or cement, this trough is formed into a circle to surround the tree, any irregular space between the tree and side of the trough, being filled with tow or other soft material, the trough is then to be filled with oil, the rain is kept from the oil by a roof formed of the same materials as the trough, and covered with the same composition, the roof is in shape of a common lamp shade, and is placed round the tree a few inches above the trough, where the whole is carefully placed, it must be an effectual method for preventing the ascent of the grubs, but too complicate to be made by every farmer, from description, and perhaps too expensive. The Committee consider its effect so cer-The Committee were pleased to see that two tain, that they recommend it for a few valuable trees in a garden, or near the house, when there may be doubts of the end being attained by any economical for the farmer, and of easier draught of the other modes in practice. The Committee for the cattle. For the great improvement in this hope its utility will be further tested, but do not

award a premium.

JOHN MEARS, of Roxbury, presented for premium, a machine for filling sausages, with which the labor is performed with more ease, and more expeditiously, than by any machine for that purpose now in use. The meat is put into a tin tube about hand. Mr Pope's object was to show the Comfour inches diameter, and six or eight inches long, mittee with what ease and advantage it could be forming a cylinder, to the bottom of which a tin is worked by horse power; and for which purpose soldered, forming a tunnel, the lower end of a size he attached a helt or band from a horse power to receive the sausage case, the meat is discharged into the sausage case, by a piston, which is the stall for his Grater Cider Mill. The machine moved by a rack and pinion of east iron. By moved with great rapidity and with perfect ease to means of this apparatus, from one pound and an the horse. Mr Pope fed the machine with rice eighth, to one pound and an half have been filled straw, and it thrashed it with very great despatch in one minute. Mr Mears produced certificates and perfectly clean, every kernel free from stems of its performance, and the Committee consider- and foot-stalks. The Committee think Mr Pope's ing it a neat and useful machine, award a premi-inachine well calculated for thrashing rice, so far handsomely and economically fatted. um of five dollars.

Grater Cider Mill, which he introduced from Troy, power mill, which is very convenient, not taking State of New York, where it was invented and so much room as those in general use, and far the patent right secured. Mr Newell has pur- better than any that either of the Committee have chased the right to make and vend for several seen in operation. counties in this state. It has a wooden cylinder upon the surface of which nails are fixed, the volving Horse Rake, and produced certificates of cattle as at any exhibition since the commenceheads sharp upon the edges, and project above its usefulness in other States. But as some have the cylinder about one eighth of an inch. The been in operation in Massachusetts, and no certifapples are filled into a hopper placed over the icate produced of the manner in which they percylinder, and led into a narrow cavity at the up- formed the work, the Committee could not award per side of it. The cylinder is mounted on a high a gratuity. frame, its axis being placed in composition boxes, a rapid revolution is produced by connecting it ination, Thomas' Hand Garden Winnowing Mill with a horse mill by belts or bands, the apples are for cleaning garden seeds, a lot of japanned woodreduced to a fine pumice, grated, not pressed. It en Ware, American manufacture-a Fork from performed well in presence of the Committee, and Mr Grieve of West Newbury, for digging or turngrated a barrel of Russet apples, in one minute ing heavy hard soil, an improved and convenient thirty-four seconds. Certificates were produced Hand or Counter Scale for weighing, all which he signed by respectable persons in this State, some keeps for sale, with most of the approved agriculin this neighborhood, and from persons in New tural implements, at his store in Boston. York and New Jersey, all recommending this mill in very strong terms, some certified that seven husbels of apples usually produced a barrel of cider when grated in this mill, and that the quality of the cider was such as to bring, in the New York market, four shillings per barrel more, than cider from apples ground in the common mills .-To Mr Newell the Committee award a gratuity of To Benjamin Harrington, of Princeton, for twelve dollars.

George Coolings, of Watertown produced a rail road, and canal Earth Cart, invented by him To Gen. Salem Towne, for his Ox, weight and now in use at Lowell; it was also used last summer in making a road in East Sudbury, one man with the Cart excavated and removed on an To Nathan Slade, of Somerset, for his Ox, average, ten square or four hundred thirty-two cubic feet of earth per day. At Lowell the Carts are moved by horse power; and in digging a canal, one horse in eleven hours removed ten squares of earth two hundred and sixteen feet to the square, carrying the earth one hundred rods-at. the same place three horses in one day removed thirty squares measuring six thousand four hundred and eighty feet-or three hundred and fifty tens; for the same work, at the same place, it required twenty-four yoke of oxen and twelve drivers. Mr Coolidge uses a temporary rail-way, as he terms it, made of pine or spruce plank 2 inches thick, and in his written statement says one man with his eart can remove more earth in one day, than a man with a cart and four oxen can drive To Benjamin Harrington, of Princeton, for twenty rods and discharge in the same time. The body of the cart examined by the Committee will hold ten or twelve cubic feet; it is formed under the axle, and the bottom opens to discharge the

load. To Mr Coolidge the Committee award twelve dollars.

Mr Jos. Pope brought his machine for threshing grain, and for which he obtained the Society's preminin several years since when worked by mill, which Mr Newell had put up in the cellar of as they could judge from this trial of a small quan-JOSEPH R. Brighton, Oct. 15, 1828.

The Committee on Fat cattle, Bulls, and bull Calres REPORT as follows, viz.

his Ox, weight, 2,500 lbs. they award - \$25 00 the first premium - -

2,237 pounds, from imported bull Hollerness, they award the second premiun 20 00

weight 2,315 pounds, they award the third premium.

To Ichabod Stow, of Stow, for his Bull, two years and six months old, weight 1,800 pounds, they award the first premium

To Lincoln Brigham, of Cambridge, for his Bull, weight 1,176 lbs. they award the second premium

To B. P. Williams, of Roxbury, for his Bull, thirteen months and ten days old, from an improved cow, by imported bull Admiral, weighed, on the 6th of Sept. 657 pounds-on the 14th October 845-in thirty-eight days increased 188 pounds, they award the third premium -

his Bull Calf, six and a half months old, of the Holderness breed, they award the - 15 00 first premium -To John L. Boylston, of Princeton, for his

Bull Calf five months old, dam from Denton, they award the second premium - 15 00 To Nath'l. B. Vose, of Boston, for his Bull

Calf, five months old, they award the

third premium -Mr. Sam'l. Sweetser, of Athol, county of Worcester, entered a very fine Ox, fatted on hav and grass, with a few potatos in winter; he was not large, but very fat-was considered a profitable animal for slaughter, and fatted at a very moderate expense. He would have received a premium, but having been purchased by Mr. Winchester, (one of the Committee,) previous to the show, he insisted from motives of delicacy, that a premium should not be awarded Mr. Sweetser; observing it was worth the premium to exhibit an ox.so

The Committee could not but observe with pleasure, the six pens filled with fine cattle, by J. Estabrook, Esq. of Athol. Mr. Boylston's milch cows and fat cattle, and many others which could not fail to show a great improvement in neat stock. The Committee are fully satisfied the pens were filled with as many, and certainly as good ment of cattle shows at Brighton.

GORHAM PARSONS, TIMOTHY WALKER, Committee. EDMUND WINCHESTER, Brighton, Oct. 15th, 1828.

The Committee on Agricuttural Experiments, to whom the inspection of Butter, Cheese, and Cider exhibited for premium, was also committed, REPORT

That fifteen parcels of butter were entered on the books of the Secretary of the Show, for premium; of these, eleven parcels containing from 3 to 400 pounds each, were exhibited for the premium of \$100, which the Trustees of the Society were enabled, by the subscriptions of a number of respectable citizens of Boston, and its vicinity, to offer to farmers residing within the New England States, in order to encourage improvement in the quality of butter brought for sale to the Boston market. The most part of the hutter exhibited. was well made, of a good flavor, and evidenced unusual attention, both in the manufacturing, and packing of it. The Committee award said premium of \$100 to Mr. John L. Boylston, of Princeton, in the county of Worcester. This butter is packed in 8 new firkins, made of hard wood, containing about 50 lbs. each. In colour, taste, absence of huttermilk, and of all foreign aids, it may be pronounced to be equal to the best imported, 10 00 and much famed Irish butter.

The Committee award the Society's premium of \$15 for the best 50 lbs. of butter in boxes to Mr 30 00 Michael Crosby, of Bedford. For the next best, \$10 to Mr Luther Chamberlain, of Westborough. This butter is of an excellent quality, and flavor, not being packed according to the views of the gentlemen offering the premium of \$100, but in small jars, proper only for the retail market; and being offered for that premium, and also for the Society's premium, which of itself required 50 lbs. The quantity exhibited was not sufficient to entitle Mr. Chamberlain to the first premium, had all other circumstances have been favorable. For the next best butter, the premium of \$7 is awarded to Mr Jonathan Wait, of Whately, in the county of Franklin.

Six parcels of cheese, not less than one year old-and sixteen parcels of cheese, of the present The Committee award the premium of \$10 to Mr. cd safe under the farmer's key. Danforth K. Tufts, for the best new cheese. For the best old cheese, the premium of \$10, to Mr. Elisha Mathews. For the next best, \$5, to Mr. Daniel Hunter, all of New Braintree, in the county of Worcester.

Three harrels of eider were exhibited for premium; the Committee are of opinion that neither of the casks is of a sufficiently good quality to be entitled to either of the premiums offcred by the Society. That exhibited by Mr. John Perry, is the best, and the Committee recommended a gratuity of \$10, to be paid to him. This cider was

made in the year 1826.

Mr. Ebenezer Withington, of Dorchester, and Mr. Simeon Greene, of Mansfield, exhibited, each wine; no premiums were offered the present year by the Trustees, for either of these articles.

Mr. John Webber, of Beverly, exhibited a quantity of his excellent mustard, well packed in tin cases: for which he found a most ready sale.

To Mr. Jeremiah Crosby, of Billerica, the Committee award the premium of \$50 for the best apple orchard-this premium is awarded on the report and recommendation of a Committee of the £30. Trustees; of which the Hon. John Lowell was chairman, who visited Mr. Crosby's orchard a few days since.

The Committee award to Mr. Samuel Chamberlain, the premlum of \$20 for the greatest quantity of butter, and cheese, made on his farm, be-1.700 pounds of skim milk cheese and 800 pounds of butter. Mr. Chamberlain states, that for two weeks of the time abovementioned, he made 150 pounds of butter per week from twenty cows; and particularly when its excellence is considered. that for several days he made from twenty-two cows, 64 pounds of new milk cheese each day. All which is respectfully submitted.

THOMAS L. WINTHROP, BENJAMIN GUILD, JOHN C. GRAY, EDMUND T. HASTINGS.

Bristol, Oct. 15, 1828.

Passages from various writers relative to the Scotch Threshing Machine.

Mr. Arthur Young of England has the following passages about Threshing Machines.

"The farmer may lose immensely, if his straw be not threshed clean; and as it is a work generally performed by measure, the men are too apt to turn it over too quickly, and to thresh out only that corn which comes the easiest from the ear .-In respect to pilfering, the work gives them great- the interest of the day. But it was not its length er opportunities for it than any other!"

"The expense of a fixed mill is from 60 to 100 guineas, for one that requires 2 or 3 horses. It will thresh out about 15 quarters of wheat (about 117 bushels) in 8 or 9 hours; and from 15 to 20 that thrashes worse with them, than any other ;but I have seep several that thrash it as other grain; Such as Mr. Ashley's. His price for a fixed one is 75 guineas; and for a moveable one 120.

the next best, \$5, to Mr. Samuel S. Woods. For greatly multiplied; but at present (1814.) it is ad-field, it carries a lesson of striking admonition. mitted by all the best judges, by those who have | "Among the strangers of distinction who hon cheap machines are deficient in strength and dura-ternor, and licut, governor, and adjutant general of ment of oxen has been found much superior to ed agriculturist, and his prepossessions are in fathe team. Upon this plan the expense cannot be ments, and in the discharge of their obligations to moveable machines, paying 1s. 2d. per quarter for where but one grew before." wheat, for the mere threshing; but it answered this Extract from Mr. Young.

In Mr. Young's catalogue of Farming Implements, at the end of his Farmer's Calendar, we have the following prices given, on the plan of sccuring solidity and durability.

threshing machine, [apparently a hand machine]

The immense superiority of Mr Pope's threshing machine over the above named, as to cheapness in the original price; and its greater excelprofit, which all just men must admit to be reastween the 1st day of June, and the 1st day of onable, since many patents fail in their intent, and gant sofa with spring seats, by Watrous & Dick-October, being 4,150 pounds of new milk cheese, the right to others is contested, independent of inson. A superb coffee urn, from T.D. & S. Boardperfection, the addition of this profit, we say, leaves Pope's machine as most remarkably cheap,

The beauty, ones formed for filtration. The cheap mode practided to our catalogues. The cultivation of indithe fragrance, and the perfect fence of the thorn tised with the aid of the draining wheel, which genous forest trees and shrubs, esteemed for utility hedge, are purchased by twelve years of eare and will effectually trench twelve acres in a day, is or as ornamental, has been extending; and the expense upon the growth, and continual diligence worth attention. That simplest of all draining, study of betany is becoming more general, as well in clearing and cutting. After enclosure, and the single deep furrow of the plough, with the sod for practical uses, as on account of the high intelshelter, the operations of tillage, seem to proceed pared upon the inner side and restored to its na-lectual gratification which it affords to the man of upon three simple principles. The soil is to be tural situation, is in the power of every husband- leisure or of opinionce.

From Loudon's Gardener's Magazine, [London] for Aug. 1828, just received at the N. E. Farmer office.

On the Horticulture of the United States of America. By JESSE BUEL, Esq. C.M. H.S.

Horticulture received but little attention in the United States, until quite a recent period; and, with occasional exceptions, was limited to the culture of common culinary vegetables and fruit. A young people must earn the means of procuring the luxuries and elegancies of horticultural refinement, before they can enjoy them. The wants and necessities of a new country are generally too imperious to leave much time, or to afford adequate means, for indulging extensively in the ornamental and scientific departments of gardening; and perhaps the republicau principles of the gov-

for the purpose of tillage seems but lately to have crnment, and the habits of the people, have in a ular favor; and here, where all are upon a political equality, whatever savors of singular osten-Many of our most favorable situations for high tation or extravagance rather begets bad than culture might be improved by a provision to with- good feelings. The Tartar conquerors conciliathold or impart moisture. The remark suggests ed the Chinese, by conforming to the laws and customs of those whom they had conquered. But the greatest obstacle to improvement has been been no royal gardens, no horticultural gardens, morial of persecution. It is refreshing to the eye, no botanical gardens (but in name), no public garand to the spirit, to look upon that valley in the dens, to stimulate and instruct those who might especially when in a dry season, it seems a green this branch of rural improvement. Respectable ciation. No plan is followed out, and each new Oasis amidst a parched and burning region. But private gardens were occasionally found in the tenant, like the philosophers swarm of flies, comes this dry season seems necessary for its greatest neighborhood of large towns; but their number more hungry than the last, to exhaust the heart fertility. It suffers in the wet. Should each pro- was too small, and the access to them too limited, prietor run a trench across that portion of his to produce much influence towards general im-It is also a truth that the first fruits of cap- farm, which begins to ascend the highland, the provement. Four or five public nurseries are all

About the year 1815, a spirit of improvement in has been fostered and greatly increased, by valuable periodical publications devoted to these branches of industry, by the munificence of State governments, by numerous associations of practical publications of Great Britain; and among the lat-When the proprietor has not the command of ter, Sir, your Encyclopedias and Magazine have assurance, in the skill, perseverance, and vigor, with which our people are pushing improvements

Our nursery establishments are increasing in

My personal acquaintance with American nurseries does not enable me to describe them particularly. I shall, therefore, barely enumerate the most distinguished, with the view of affording to your readers useful memoranda, in the event of their wishing to procure American trees, plants,

The Linnean Garden, at Flushing, is the oldest, and probably the most extensive, nursery establishment in America. This nursery has been already noticed in your Magazine, in the communications and advertisements of its proprietor, Mr.

Bloodgood's Nursery, at Flushing, is principally devoted to the propagation of fruit trees. The proprietors are practical men, and have acquired a reputation for great accuracy and the fine condition of their trees.

the account of the Linnean garden.

Floy's Nursery, on the island of New York, is appropriated to the culture of both hardy and tender trees and plants. The collection of greenhouse plants is respectable, and comprises many rare and beautiful varieties. -

Wilson's Nursery is in the neighbourhood of Floy's and embraces a like culture and variety. York. It is principally devoted to green-house

culture and hardy shruhs.

The proprietors of the three preceding establishments stand high as hortlcultural botanists, and as men of practical skill and industry. The high price of land has in a great measure circumscribed their labers, and somewhat limited their culture to those articles which promise the most prompt and certain return.

The Albany Nursery was established by nivself, in connection with Mr. Wilson, a practical gardener. In addition to the fruit and green-house our situation peculiarly qualifies us for furnishing seeds of native kinds in the best condition. We have spared no trouble or expense to obtain all the choice varieties of fruits; and have in progress descriptive catalogues, which I propose sending you when completed.

Botanic Garden at Brooklyn. This has been recently established by M. Parmentier, a gentleman of taste from the Netherlands. As M. Parmentier has brothers in the Netherlands and in France, eminent for their pemological researches, his establishment will be eminently useful, by introducing among us the finer fruits of the Euro-

pean centinent.

Landreth's Nursery, at Philadelphia, is an old and respectable establishment, and is devoted to the culture of native and foreign plants hardy and tender. It has prefited much in rare American plants, from the labers of botanists who have explored the interior, under the orders of government. The varieties of the magnolia are numerous, and in fine condition. I saw in this nursery, in August last, the Osage apple (Maclura?) in fine bearing.

The Burlington Nursery is in New Jersey, 20 miles above Philadelphia. It sustained a high reputation under Mr. Cexe, and I believe, is likely to maintain its character under Mr. Smith, the

present proprieter.

Kenrick's Nursery is at Newton, in the vicinity of Boston, and is appropriated to the raising of

fruit and ornamental trees, &c.

Sinclair & Moore have commenced a nursery at Baltimore, principally, I believe, for propagating fruit trees Respectfully, J. BUEL. . Ilbany, N. Y. Feb. 6th, 1828.

IDIOSYNCRASIES.

That curious, sympathetic, wonder working person, Sir Kenelem Digby, is perhaps, the greatest detailer of singular fancies relating to antipathies and sympathies. He narrates the dire effects of flowers upon certain people, even to fainting and dying. So obnoxious was a rose to the lady Heneage, that she had her cheeks blistered, says Sir Kenetem, by laying a rose upon her when she was asleep. It is even stated that Cardinal

Mills & Lawrence have also a nursery at Flush- Caraffa, and a noble Venitian, one of the Barbarbleeding .- Shenck. Obs. Med.

was troubled in this manner, the cause of which cash .- Boston Putriot. she was utterly ignorant of. Bruverinus knew a girl, sixteen years of age, who, up to that time, pork is very common. Shenckins tells us of one who would immediately swoon as often as a pig was set before him, even though it be enclosed in departments, we are rearing many varieties of he return to himself till the pig is taken away cess. Many a culprit has begun with robbing a hardy forest trees, for utility and ornament; and from the table. Marshal Albert fainted away when he saw the head of a boar.

> Horticultural rarity .- One of the finest samples of the advantages derived from the increased attention to gardening and fruit trees in this country, was presented to us yesterday, in the ferm of a most delicious peach, by alderman Peters, raised by him in his garden at Greenwich. It is one of the Heath species, vulgarly called the October of a large size, being no less than ten inches in circumference, and weighing ten ounces-and it grew on a tree but two years old. Such delightlow leaves are scattered by the piercing winds of autumn, is a rarity indeed, well worth the cultivation of the scientific votary of Pomena or the ordinary practical gardener .- N. Y. Statesman.

> Extraordinary Growth -- We vesterday saw, at the store of Mr John M. Ives, a crooked neck E. Jocelyn, of this town .- Salem Observer.

Cotton raised in Salem .- Two cotton holls rais- ter all he its salvation. ed this year in the garden of Capt. Joseph Edwards, of this town, have been left at our office. The seeds were planted in May. The bolls are of a fair size and nearly ripe. We believe, that some successful experiments, in raising a few rine holls were tried in Worcester last year. - Ibid.

Vegetable Curiosities .- We are informed, that in several instances, on this island, the Lilae has put forth new leaves, and bloomed a second time. The flowers were as full, as delicate in colour and tints, and as fine scented, as those which shed their fragrance in the spring. A second growth of peaches has been had in New Jersey; and in self, I have thought proper to communicate the various parts of the country, where no second following facts and observations to the public, growth has occurred, the character of the peach with a view to excite inquiry and elicit informahas been singularly changed in colour, flavor, and time of maturity—the branch that bore late fall off so many of these useful animals during the peaches last year, producing high flavored rare present season. ripes this - a month earlier than their regular period .- . V. Y. Statesman,

Butter .- At the l'air of the Massachusetts Aging, in which I understand Mr. Prince has become age, were confined to their palaces during the ricultural Society at Brighton, on Wednesday, the a proprietor, and which is probably embraced in rose season, for fear of their lives. Johannes e premium of one hundred dollars, subscribed by a Querceto, a Parisian and Secretary to Francis I., number of gentlemen and placed at the disposal king of France, was forced to stop his nostrils of the Society, was awarded to Mr John L. Boylswith bread when there were any apples at table; ton, of Princeton, for the best butter. There was and so offensive was the smell to him, that if an a large quantity of Butter exhibited, and it is conapple had been held near him he would fall a fidently expected that the object for which the premium was subscribed will be attained, viz. the "I saw a neble countess," says Horstine, "who production of the first quality butter in large quantasted of some udder of beef, and had her lips tities and a corresponding decrease of the inferior Hogg's Nursery is also upon the island of New, suddenly swelled thereby; observing that I took qualities with which our market has for many netice of it, she teld me she had no dislike to that years past been filled. Mr Boylston's butter, we kind of dish, but as often as she did cat of it she are informed, was sold for 26 cents per pound.

> The adjourned meeting of persons in Salem had lived entirely on milk, and could not hear the and vicinity, interested in protecting Gardens and smell of bread, the smallest particle of which she Orchards from trespassers, was hell in Salem, would discover by the smell. An antipathy to 12th inst. E. II. Derby, Esq. Chairman, and T. P. Bancroft, Esq. Secretary. Articles of association were agreed to and a committee appointed to obtain subscribers to the same. The object of the paste; he falls down as one that is dead, nor does association is praiseworthy, and we wish it sucgarden, and ended his career in a public prison. The progress in crime in most cases is gradual .-

> Princeton .- This flourishing town in Wercester County bids fair to be the prince of towns in gaining premiums for fine stock, &c. at Cattle Shows. At the Worcester Show, not less than twelve premiums were obtained by citizens of Princeton, and a very large number of premiums, together with cling, white in complexion, of exquisite flavor, and the hundred dollars' premium for best butter, were also at Brighton awarded to Princeton farmers. It is a town but little known, but of itself is an object of considerable interest. Wachusset ful fruit, at this late season, when most others of lies principally within its limits, which is the highthe kind have entirely disappeared, and their yel- est land in Massachusetts. Its inhabitants live principally by agriculture, and are remarkable for industry, sobriety and agricultural enterprise. 12 has for many years been distinguished for fine cattle-lbid.

> The Cattle Shows and Fairs at Fredericksburg, (Va.) are to be revived. They have heretofore Squash, which weighed between forty and forty-been occasions of great interest. With a little of one pounds. It was raised in the Gurden of Mr our yankee industry and manufacturing enterprise, the "Ancient Dominion" would soon resume its aucient glory. SHEEP.

Feeling a lively interest in the prosperity of the sheep business in this country, having a flock mytion in relation to that disease which has carried

Some time in February last, I looked at a flock of yearling lambs, (about 200 in number.) belong-

time they were in a thriving condition. In February, when I examined them, several had died and His Excellency the Governor, Hon. T. PICKERING, the remainder were very poor, and a general cough Senor Manuel Lorenzo Vidaurre, &c. As on prevailed among them, which increased with a the same occasion in years past, some of our horshrill sound, a dull and heavy appearance, and extreme emaciation. Some time after, I dissected a sheep of this flock, which had fallen a victim to the disease. I commenced at the cardia, (pit of the stomach,) and cut obliquely backward, in the direction of the diaphragm on both sides, more than half way between the spine or backbone;thence to the pelvis on both sides, so that I could have a complete view of the contents of the abdomen. I found no adipose matter. I continued my examination about the region of the colon ;but found no inflammation, nor any other morbid appearance, until I came to the duodenum; it contained nothing but a little yellow, greenish slime, the duodenum somewhat inflamed, but the liver quite sound. I then passed the knife between the ribs and cartilages which connect the ribs with negligent breeder. the sternum, which I removed. I dissected the pleura and exposed both lobes of the lungs. They were indurated and inflamed from the extremity, more than half way to the bifurcation of the trachea or windpipe. I opened the pericardium, but saw no morbid appearance. I then laid the lungs open, and in the cellular substance of the lungs and in the bronchial vessels there were a multitude of worms about as thick as a linen thread, and from one to six inches in length, exceedingly sharp pointed at one end, and that end of a chestnut brown celor, the rest of it of a pale white color. In a day or two after, I dissected another sheep while it was yet warm, and found the appearance precisely the same, only that the worms were alive; in the other they were dead. I directed Scotch snuff to be given to the sheep which seemed to be diseased, on their food morning and evening, and tar and sulphur once a day. They appeared to improve in health immediately. The same application was used in a neighboring flock, and apparently with good effect. Whether it is a remedy for the disease I will not undertake to down to posterity improved by our labors. decide, as but one or two experiments have been made; but it may be deserving a further trial.

BOSTON, FRIDAY, OCT. 24, 1828.

THE BRIGHTON SHOW.

In our last we noticed some interesting particulars of the Show on the 15th, referring our readers to the respective Reports of the Committees, for a more full account. Most of the official Reports will be found in this week's paper.

A meeting of the Massachusetts Society for promoting Agriculture was holden at the Society's Hall; and at half past one, the members with invited guests proceeded to the Rev. Mr Austin's Church, where the Premiums were announced by public improvement. May the autumn of a life the Assistant Recording Secretary. A procession of action and eminent usefulness and patriotism, was then formed to the Mausion House Hotel, reap an ample barvest of bonor, satisfaction and where a sumptuous dinner was provided, at which | comfort.

ing to J. R. which I had seen in the fall; at that His Honor the Lieut. Governor, as President of the Society, presided. Among the guests were ticulturists contributed from their stock of fine fruits, to enrich the dessert; and the table was enlivened by a great number of spirited and appropriate toasts. We have selected the following from among them:

> Agriculture, Commerce, and Manufactures-the three great arteries of our national prosperity, composed of the same blood, and united by the same ties-a wound inflicted on either is felt through men and other First Ratesmen-May they have a the whole system.

The Agricultural Societies in the United Statesmay their labors be viewed as joint stock, and a trial be annually made which shall contribute most,

Native and Foreign, Long Horns, Short Horns, and No Horns-are all alike to the niggardly and

To the industrious Farmer-Large crops and great prices-to the sluggard and the sloven, short commons and Canada thistles.

Those distinguished Foreigners, THOMAS AN-DREW KNIGHT and FRANCIS ANDREW MICHAUX, who have done so much to increase and to bring to light the natural resources of our country,splendid examples in support of the principle, that no national or political distinctions should be known in Agriculture.

By His Excellency the Governor-

The Sword, the Press, and the Ploughshare, the great implements of labor and effect. May an independent yeomanry bear in mind, that on their soil it is the latter only, which can now be employed to improve by subverting.

The Plough .- Its one share in a bank of earth, is worth ten in a bank of paper.

The Fathers of the Revolution-They defended the soil at the cost of their bloed, let us show our

Our Farmers !- Let their remember, that "the ox knoweth his owner," and take care that their cattle be not ashamed of their acquaintance.

Let every cultivator be employed both in agriculture and politics; he comes to nothing who sits upon the fence.

Our native soil-The farmer's capital which can never be turned without profit.

Republican Heroism-Which consists in inflexibly doing right, in despite of misconstruction, misapprehension, and misrepresentation.

AGRICULTURAL EXHIBITIONS.

The annual meeting of the Rockingham, N. II. Agricultural Society was held at Exeter on the 15th inst. The exhibition was attended by a goodly portion of intelligent yeomanry from different parts of the county. The show of neat cattle was the best sustained part of the exhibition; some of them were very fine.

Mr. Peabody's address was highly spoken of, and a general wish expressed of having it pub-

Among the premiums, were one of ten dollars for the largest quantity of corn on an acre, being eighty-six bushels and a balf, to John Moulton, of Exeter. For the largest quantity of potatos on an acre, being three hundred and ninety-eight bushels, to Josiah Butler, of Deerfield, six dollars. Premiums were awarded for fulled cloth, carpeting, flannel, linen, blankets, manufactured leather, and for a black lace veil, a white lace handgratitude by faithfully tilling it, and handing it kerchief, cap, worked handkerchief, palm leaf hats, &c.

> The following are the officers for the ensuing year :-

JOHN FOLSOM, President,

JOHN HARVEY, Vice President,

ICHABOD BARTLETT, Corresponding Secretary, SAMUEL T. GILMAN, Recording Secretary, Faeese Dearborn, Treasurer.

James Rundlett, Clement Storer, Joseph W. March, Nathaniel Gilman 3d., Peter Patterson, Benning W. Sanborn, Jacob Cilley, Wm. Plumer, Jr., and Levi Lane, Directors.

Joseph Fowle, Marshal-Oliver W. Hilton, Dep. Marshal-Charles W. Cutter, Orator, for the ensuing anniversary.

CAROLINA SWEET POTATOS.

MR. SAMUEL POND, of Cambridge, has left at Carolina potatos, weighing four pounds-raised from slips sold at this place. Mr. P. planted one quart of the slips, in eighteen hills, which yielded three and a half bushels of very fine sweet potatos. The hills were raised up on the soil like large squash hills-the slips placed in the top of the hill without any manure, and were not even started in a hot bed. The only care required, is to keep them free from weeds. The soil should be somewhat sandy. A few planted in a rich loam

were very indifferent both as to quantity and quality. The fact that this delicious vegetable can be so easily raised in New England cannot be too generally made known.

DOUBLE APPLES.

We bave received from Mr NAHUM MILLS, of Brandon, Vt. a few apples, all of which are either double, or triple. Mr M. informs as they are from a tree about thirty years old, which bears full every year; the apples always possessing this peculiarity.

Cider is now selling at Warner, N. H. at fifty cents per barrel-apples, best engrafted kinds, seventeen cents per bushel; common sorts, ten cents. In Boston, good cider sells at \$2.67 per barrel-best winter apples \$1.00 per bushel .- A rail road to Albany, with branches to the principal towns would equalize prices.

THANKSGIVING.

His Excellency Governor Lincoln, has appointed Thursday, the 27th day of November next a day of public Thanksgiving and Praise.

The same day is appointed a day of Thanksgiving, by Governor Tomlinson, in Connecticut.

The Worcester county Agricultural Society has eight hundred members, and a permanent fund of \$5000.

In our attempts to improve on nature, we frequently defeat our own purposes. Farmers are extremely anxious to get rid of moles, whose hillocks, it must be confessed, destroy the smooth level of grass and corn fields, when they are very abundant; but it has been found, (in some farms) by experience, that when moles are extirpated, worms increase so prodigiously that the môles have been wished for again, as the least evil of the two.

Prolific pea .- In a garden at Eppleby, a single pea produced this season the enormous number of 500 peas, measuring in their pods, nearly half a peck.

Great growth .- From a single squash seed of the crook neck species, there has been produced in a garden in this village (the present season) five squashes, weighing as follows: 31 pounds - 261, do .- 251, do .- 243, do .- 24, do. Total weight, 1313. - Taunton Reporter.

ITALIAN SPICE SEED.

Ma Russell .- I send you per the bearer a small quantity of the Italian spice seed. It was first introduced into this town about seven years since, from Italy, via New York. The seed partakes of the qualities of the Thyme, Sweet Marjoram, Summer Savory, and Lemon; and answers all the purposes of those herbs combined for the stuffing of meats. The plant is about the size of the pepper plant, and requires about the same culture. The blossom imitates very much the Bachelor's Button, and the pod which contains the seed, that of the Columbine.

The seed is submitted for your consideration. I confess I never have seen any before. I think it may prove an acquisition to the valuable assortment of seeds vended at your Establishment. Your ohed't serv't.

JOS. G. TORREY.

Bath, Me. Oct. 8, 1828.

Blackstone Canal .- During the favorable weather succeeding the cattle show, the work for the full completion of the canal has been prosecuted with activity, and we understand, it will soon again be re-opened for permanent navigation, and during the remainder of the season may be used for transportation until the waters shall be closed by the winter's frost. In this respect the railway has superiority over the canal, that communication is not liable to be interrupted by cold, and during the winter may be used with the same advantage as in the milder seasons of the year .- Worcester

Upwards of 4,000,000 dollars are invested in a manufacturing establishment in Lowell;-and a canal is making for water privileges for twelve more factories.

REMEDY FOR THE GAPES IN CHICKENS.

Take as much kitchen soap as will cover the thumb nail, and having mixed it up with some meal dough, give it to your chickens, at any stage of the disease. This has been found effectual on Du Pont's Gun Powder, at 23 to 50 cts. per pound-Shot-Balts the first application, almost always; a second is rarely necessary, and when it is so, it is next to impossible that it should fail.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Nurcissus, Gladiolus, Snow Drops, Crocus, Star of Fethlehem, Jonquilles, Ramuiculus, Iris, Crown Imperials, Anemones. Crous. &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pale hlue, pure white, red, yellow, and white with various eyes, at

30 per root.
The collection of LLLIES is very splendid, comprising Sear-let Chalcedonian Lily 37 cents, Orange Pompone Lily 37 cents Chuese Leopard 25 cts. Orange Martagan 37 cts. Yellow Mrtagan 37 cts. Purple and White Scotted 37 ets. Bright Scarlet Pompone 50 ets. Double White 37 ets. Large White Garden Lily 12 cents, Dwarf Chinese Red Lily (Lilburg concolor, new and very superch, one toot only) \$1.50 TULIPS—splendid variega'ed, red, yellow, and mixed, 12

cts, each, \$1.00 per dozen.
CROWN IMPERIALS—assorted, of the most splendid col ours, and showy flowers, Jarge roots, 38 cts, each,

JONQUILLES—sweet scented, finest roots, 19 ets, each, POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots,

38 cts. each.
D'UBLE NARCISSUS—fragrant, of all colors, 19 cts. each SPRING CROCUS-of all coleurs, 6 cts, each, 50 cts, per

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 8-10ths in diameter.

Purchasers are requested to notice that the above roots are no purchased at auction, and are all remarkable for their size, and for the heauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also pots for blooming the Crocus, in the shape of Hedgehogs, Also pots for blooming the Crocus, in the snape of Heigeners, Porcelain Dice-work Flower Baskets, (very heautiful) Bechives, Flower Pots, Half melons, Cones, &c.—a new article.

Two roots only of Wilmot's Superb Strawberry.

Just received at the

New England Farmer Seed Store, No. 52 North Market Street-Boston.

Orchard Grass Seed .- Flint Whent, &c. further supply of Orchard Grass Seed-growth of 1828.

Two hundred counds of Red Onion Seed.

A few hushels White Flint Fall Wheat, commonly called Canal Wheat .- Also, Gilman Spring Wheat. Just received at the

New England Farmer Seed Store, No. 52 North Market Street-Boston.

New England Printing Ink Manufactory. The undersigned has on hand from the above Establishment, a constant supply of Printers' Ink, warranted in no respect inferior to the best made in this country. Book, Roller, and News lok in large or small quantities.—Also Composition Rollers and Tables, of the mest approved construction.—Terms reasonable. JOHN RAKER.

Opposite the Post Office.

Sausage Machine.

Orders for the Sausage Filling Machine. (pest-paid,) sent to the Agricultural Establishment, No. 52 North Market Street, Boston, or to the subscriber, will receive promot attention. Dorchester, Oct. 23. JOHN MEARS. Dorchester, Oct. 23.

Done of the machines is left at the Agricultural Warehouse for examination.

Out Meal, Out Flour, Grotts, &c.

Just received at the New England Parmer Seed Stere. Just received at the new Lagishot Larrier Seed Sicre, a forther supply of the above articles, v. 26 tarries of freeh Ost Meal, fine bolted Ost Floor, Hulled Osts or Vermont Rice. Scotch Barley, & c. for sale in any quantities, wholesale or re-tail. Also a few counters of fine Ost Flour, nearly pecked, at 50 cts. per cannister.

Hemp Seed.

A consignment from Troy, N Y. of 50 bushels of Hemp Seed, growth of 1827; by the tierce or bushel.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornations. mental, in quantities sufficient for a common kitchen garden.— Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the

MISCELLANIES.

The Season .- A tree in Perth Amboy, N. J. has produced the present season two crops of peaches: the first of three bushels, the second of about a hundred peaches. The lilac bushes in and about New York and Philadelphia have also, in several instances, produced two sets of flowers this season -strawberries of a good flavor, raised in the open air, have been lately gathered in a garden in Brooklyn, N. Y.

The Pensacola Gazette trusts that Florida will no longer be called "the Paradise for Rogues," since the Marshal of the District has received orders to put the U.S. Jail in that city, in repair.

Large Production .- Mr Russell Wood, of this town, took from his garden a few days since a common crooked neck winter squash, which weighed 34 pounds .- Taunton Advocate.

A number of citizens of New Jersey have held a public meeting in Mount Holly, with the object of having a rail road constructed between Camden, Gloucester county, and the Raritan river, or Tours,* the Imperiale violette, and the Imperatrice bay, in the county of Middlesex.

It is found that the lead on the dome of St Panl's Cathedral, London, has been fused by the action of the sun.

Prince Leopold has succeeded in bringing to perfection that extraordinary exotic, the air plant. It is suspended from the ceiling, and derives its nourishment entirely from the atmosphere.

Muster .- On Wednesday the 8th inst. the allied forces assembled on Salem common, and the spirit-stirring drum sat many a leg in motion, and fired the breast of many a man with arder not its own. The light companies appeared with unusual splendor, while, on the other hand, the heavy, that is the companies of the line, were unusually gloomy. It is a fact no longer to be concealed, that the present organization of the militia is wretchedly defective. We need no other argument to convince us of this, than the thin and wandering ranks of our militia. Companies in which, in "auld lang syne," one hundred men were enrolled, on Wednesday marched on the tented field with only ten; "still beautiful in ruins." The Salem regiment was in fact but a handful, and the officers "were few and far between." If our present system is continued much longer, musters will only contribute to show the makedness of the land. In case of invasion, we verily believe it would be more effectual to summon the firemen, and rally round the engines and send our enemies to a watery grave, than to turn out the militia .- Salem Courier.

PLUMS.

THE PREPARATION OF PRUNES.

As some of your readers are anxious to learn the process of making prunes, I send you the following description of it, extracted from the French books. It is, you will perceive, exceedingly simple, and may be practised to any extent in this country, skill and industry might make it as profitable a business here as in Europe.

The plums must be gathered with the hand, when perfectly ripe. They cannot be too sound; and such as fall or are punctured by insects should ity determined me to propagate it both by seed be rejected. Arrange them on plates or sheets of iron so as not to touch one another, and put them those who wish to cultivate the finest vine of this, in an oven after the bread has been taken out. While there turn and move them occasionally. When become cool, pack them compactly in boxes and secure them from moisture. If they are not dry enough when withdrawn from the oven, place them in the sun; for it would render them too dry and hard, to subject them to the heat of arrived on the 13th inst. in the prosecution of an oven a second time. In choosing prunes, pretheir labors, to within five miles of Philadelphia fer those that are new, soft, and fleshy. They will keep upwards of two years.

> Prunes may be made of almost every sort of plum that is caten. But those that are considered the best for the purpose, are the Gros damas de violette.

There is another preparation of plums, in which they are called Brignoles. For them are used chiefly, and almost exclusively, the White perdrigon, which is a very fine sweet fruit. At the village of Brignoles, in Province, in France, where this preparation was first made, the Perdrigon plum is steeped in hot water to loosen the skin, then peeled, and then split open to remove the stone. The rest of the process is the same as in the preparation of ordinary prunes; that is, the drying in an oven and in the sun, and the packing away in tight boxes. The only difference, is, that less heat must be applied to the Brignoles than to prunes.

Besides the various preserves and sweatmeats that are composed of plums, the French peasantry make a liquor of the wild plum, by crushing it in water and letting it ferment.

AMERICAN GRAPES.

Mr. Skinner .- I send you enclosed some grape seed; the vine grows in a small island of Roanoke, a few miles above the Great Falls. It is surely the only vine of the kind in the State, perhaps in the world. I have had all the islands carefully examined, and another cannot be found. Its colour is purple, about one third larger than the common grape of the wood, slightly elongated, a difference in shape that distinguishes it from all others; in its flavor it is unrivalled, and when eaten diffuses a most grateful perfume. I prefer it to the Scuppernong. How it may succeed as a

wine grape, no one can say; but for the table it equals the best French grapes.

The late Gen. Allen Jones found a vine of the same kind in an adjacent island, about thirty years since, which he removed it to his garden, where it throve well and bore luxuriantly, but at his death, which happened a few years after, it was lost,-That from which I send you the seed has been known for some years to the Trappers on the river; who described it to me as being of the same kind with the one found by Gen. Jones. For three years I failed to get some of the fruit; this season I got a few bunches, when its fine flavor and rarand cuttings, and through you to offer them to and I believe of any country.

Yours, respectfully,

A. J. DAVIE.

P. S. General Jones called it the Perfume Grape. At the proper season I will send you cuttings; it is but a single small vine. These seeds should be directly placed in rich alluvial soil-they will come up next spring. I should be glad to have some directions how to put up the cuttings, and how to direct them.

My grandfather, the late Gen. Jones, who was the first botanist of the southern states, and curious both in shrubs and vines, considered this as the finest grape in his collection, and he had a great variety.

Wilson's Nursery, Derry, N. H.

The proprietors inform the public that their nursery offers p the properties muot the public that their mirrery offers pe-cular facility for the acquirement of useful fruit; moe than fif-ity thousand trees now cultivated by them consisting of a great variety of Apples, Peaches, Plums, Cherries, Quinces, &c. em-bracing, most of the celebrated and esteemed kinds in this counbracing most of the celebrated and esteemed kinds in this contry. The utmost care has been observed by the original proprietor for more than thirty years, in making the selection and the whole is now offered as containing none but the most worthy of cultivation. Persons not acquainted with the different kinds yn anne, who wish to procure choice kinds, by sating the time they wish them to ripen, may confidently trust to the proprietors without fear of disappointment. FRESH SEEDS AND ROOTS.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the Rheum Undulatum, or Tert Rhubarb, or Pie-Plant, an excellent article for summer use.

(See N. E. Farmer, vol. vi., page 290, and page 11 of this volume, and Fessender's New American Gardener, article Rhubarb, far its culture and uses.) The roots are in fine order far transplanting this fall. Price 25 cts. per root.

Potato and Tree Onions.

Also, a supply of Potato and Tree Onions. The Potato Onion has proved a fine acquisition to the list of vegetables raised in this country, and is getting into general use in the Middle States. They have produced 12 and evec 20 fold in this vicinity the past season; come much earlier than the common, are milder, and more sure of producing a crop. Price 6 cents each, 50 cts. per

Indian Corn.

Several varieties of Field Corn, selected with great care, for its earliness and productive quality—also Early Sweet and the Early Jefferson Corn, for the table.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity, expressly for this Establishment, by careful and experienced growers, and are wartablishment, by careful and experienced greeks, and at war-ranted pure and fresh. Country traders supplied with boxes of prime seeds, for the rettil trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. will be publish-ed in the course of a fortnight, and forwarded gratis to any one who will send for it.

[&]quot;The Gros damas de Tours (large damask of Tours,) is not mentioned, at least under its French name, in Mr. Prince's catalogne. What its English name is, therefore, I do not know. It is thus described in the books already referred to; the tree grows to a large size, and is apt, when a standard, to drop its flowers; the first is rather long, of a moderate size; has a deep violet skin, floured, sour, and adhering to the flesh; the flesh is yellowish, almost white, fine grain and firm; the jinice is sugarry, and has the peculiar flavor of the damask plums. It is added, that if the skin, which will not separate from the flesh, did not communicate to it a disagreeable smell, this plum would be excellent. excellent.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER

HORTICULTURE.

MR EDITOR-Having recently received complete series of the Transactions of the London Horlicultura! Society, of the Annals of the Hort. Society at Paris, and of Loudon's Gardener's Magazine, I shall (according to your request) from time to time furnish such extracts, from them, as may seen to me to be useful to our country, and occasionally extend them to subjects, which are curious and amusing, though not directly applicable to our gardens. I would here observe, that nearly seven-eighths of all the articles in these works, are of no use whatever to our horticulturists generally .--It is plain from these publications, that the horticulture of England is at least 50 years in advance of that of France, and indeed the French writers all virtually, and some of them explicitly admit it. But the distance between us, and France, or Holland, or Germany, or Russia, in horticulture, is immense. I beg Messrs Prince, Parmentier and others to pardon this remark, for I except their excellent establishments. I speak only of the general state of horticulture-of the general neglect of this art, compared with its high state of refinement in Europe, of which these works afford unquestionable evidence. I shall cite some proofs of this general diffusion of horticultural taste and knowledge, with the hope that it may excite in us a spirit of emulation. The taste for horticulture furnishes as correct a standard of the refinement of a nation, as the taste for the fine arts-if it is not as intellectual, it is much more comprehensive, and is capable of affording gratification to greater numbers. It is also intimately connected with health, and I am not disposed to admit that a taste for botany and floriculture, is not as well adapted to purify and elevate the mind, as even the fine arts themselves.

A ROXBURY FARMER.

Roxbury, Oct. 26, 1828.

REPORT OF M. DU PETIT THOUARS ON THREE PEARS SUBMITTED TO HIS EXAMINATION. (Annales d'Horticulture a' Paris, Feb. 1828, p. 86.

The object, which I have in view in calling the attention of our cultivators to this report, is to show them the attention which is now bestowed in Europe, on the names of their fruits, and the caution with which they admit new ones.

Of the three pears submitted to M. Du Petit Thouars as new varieties, he decided without hesitation, that two of them were old and well known ones. As to the third offered by M. Alfroy, some doubts arose, but on the whole he thought it bore a strong resemblance to an old well known pear, the Tarquin. M. Alfroy, the owner of extensive nurscries, which had been in his family for many generations, attempted to follow the career of M. Van Mons, of Luxembourg, in producing new varieties from seed. Out of 300 plants, which he selected as promising the best, judging from their foliage, only one produced a pear, which he tho't

but moderate reputation.

The report concludes with these remarks-"This able nurseryman, or cultivator, merits the The Baldwin so long and so confidently claimed more encouragement, since we find that he has as a native fruit produced at Wilmington, it is now not been lucky in this sort of lottery, since the affirmed, was imported. sum total of his zeal and pains has only procured one single fruit worthy of notice, and to complete ties from the stone, and yet I doubt whether any his ill luck, even this fruit is likely to be confound- nursery can produce any peaches, which to a jury ed with an old well known one, which is indeed a of connoisseurs will be pronounced equal to the phenomenon more extraordinary, than the pro- Van guard, Noblesse, Royal Kensington, Red and duction even of a new fruit. It is well known that our neighbors, the Belgians, have been more successful in these attempts; but this is nothing, any European one, but I cannot think its flavor as they say, in comparison with the inhabitants of quite equal to the white fleshed varieties of Eu-North America, who obtain numerous species from rope. I hope this may lead to discussion, inquiry,

It was for the sake of the parts italicized referring to our success, that I made the above extract, and it was done for the purpose of undeceiving the European cultivators on this subject. It is true, that we hear on every side of new varieties, but abundant as in ours. when examined, nine out of ten prove to have been imported. It is 33 years this season, since I turned my attention to horticulture, and I am not able to recollect any valuable table pear, the evidence of whose origin in this country is to be deemed unquestionable, except the Seckle, and a pear raised by Mr Johonnot at Salem, not to be elevated to the first rank, though very desirable. A small winter pear, probably native, and said to be good, on the estate of Mr Lewis, at Roxbury. very pleasant summer pear, said to be the prodee of a Juneating, sent to me by Dr Alfred Baylies, of Taunton. And, a fine pear, raised on the estate of the late Hon. Mr Gore, which is probably a new fruit, and which seems to be between the Doyenne Blanc and the Doyenne Gris (in English, the white and brown St Michaels). These are all which have come to my knowledge. I am aware that Wm. Prince, Esq. of Flushing, claims to be the producer of some others, but not having seen the fruit, I am unable to speak of their merits .-My object in calling the attention of our cultivators to this topick, is to elicit information, and I most earnestly solicit it from all parts of New England, of any estecined varieties of pears, together with the evidence that they are native productions. Our cultivators have adopted what I consider an erroneous rule, as to fruits which appear to them to be new. They assume, that every pear, the origin of which they cannot trace, must be a native; but the reverse of that rule is the most rational. Every fine pear should be presumed to have been imported, unless its origin can of the reasonableness of this rule, than the experiments of Mr Alfroy, who obtained, in the favorite country of the pear, only one tolerable one out of 300. Even Dr Van Mons could obtain only 30 or 40 out of 800; and Mr Knight's success has also been limited, though both these gentlemen adopted the artificial mode of impregnation.

As to apples, there is no doubt, that we have produced many new varieties of great merit, which is not at all a matter of surprise, since for which M. Du Petit Thouars made the above re chards for older, without grafting. Yet tho list were supplied from the compost made last year in

port, to wit, that it strongly resembled a pear of, of good table apples, compared to the many millions raised, will be found to be small. Even some of these may prove to have been imported.

The peach more readily produces good varie-White Magdalen, or the Swaalsh. We have produced a nectarine larger and more beantiful than and improvement, which is the great end of all investigation.

Though we have not as yet produced many fine fruits, yet there is no country in Europe in which European fruits have as fine flavor, or are a-

FOR THE NEW ENGLAND FARMER.

SMUT IN CORN.

Ma Editoa-Your correspondent E. on the subject of small in corn, (see No 6 of your current vol.) has, in his outset, in my apprehension, pointed out the true cause for the unusual quantity of "smut ears," namely, that "the fields of corn never looked more promising." The season, and the soil which produce the greatest quantity of corn, will, according to my observation, occasion a correspondent average of smut. In my view, the cause is to be found in the exuberance of the fluid which forms the kernel. The vessels are surcharged and burst before the aliment can be duly concocted and disposed of. As far as human agency can avail, it is in the power of every farmer to lessen the evil. But in doing this most effectually, he would find the remedy much worse than the disease. This remedy is already too conspicuous on our farms. This evil, however, may be essentially lessened consistently with raising a great crop. Having had recent experience on this subject, I consider it my duty to respond to your call, although, of late, I have occupied an undue portion of your interesting and useful pa-

Eight years ago I cultivated a field of corn, for which I obtained a premium. To a liberal supply of strong manure ploughed in, I added the usual quantity of the same to the hill. The season was uncommonly favorable to vegetation. The growth be distinctly traced; and I know no better proof was rapid and vigorous. The stalk was large and prolific in suckers. As the ear formed, the smut became conspicuous. I neglected to dislodge it until the fungus had burst through the husk in an unsightly mass. When consigned to my bog yard, it amounted to fifty wheelbarrow loads per acre. Notwithstanding this enormous drawback, my field produced the largest crop l have ever raised. I have cultivated the same field in corn the present season, with no variation except in the dressing. My coarse stable manure worthy of presentation; and this was the one on 200 years, it was our practice, to raise our or- was spread and ploughed in as before. The hills

THO'S WILLIAMS.

my yard, and carted in autumn, and thrown into ciety there were thirty competitors regularly enlarge heaps, and covered from the weather. This season has been alike favorable to the crop; and I judge, when measured, the produce will be found each a premium. to be nearly as great, without the fiftieth part of the loss by smut. The quantity has not been ascertained, as it was of so rare an occurrence as not to be worth the trouble, though severed, of bringing from the field. The suckers also were so free as to cause no injury. It appears obvious that the diminution of smut was occasioned by the quality of the manure applied to the hill.

The modern practice of ploughing in all the manure preparatory to the cultivation of corn, has, no doubt, a tendency to lessen the quantity of smut; but I doubt whether it affords as great a crop of corn. The old system of putting all the manure years old, fourth premium in the hill, is justly exploded by good farmers; yet the modern practice of spreading it all, is, in my opinion, erroneous. I am aware that the best farmers defend it. I took occasion to enquire of one who had received a premium for the best crop of corn, his process of cultivation. He informed me that he spread the manure and ploughed it in. I asked him whether he did not reserve some for the hill. On his answering in the negative, I further inquired, whether, if after he had spread what he should judge a sufficient quantity and had some left, he would not put that in the hill. His reply was, no-I would spread that also. My praetice, as before observed, is otherwise. My reasons for it are that at the time of planting, the ground, if not wet, is usually heavy, and necessarily of a low temperature. The furrow for planting, if it does not remove the best part of the mould, leaves little or none at bottom. Instead of being supported on matter, warm and quickening, hastening vegetation and affording a free exit and expansion of the roots, the seed is consigned to a hard and cold surface, is more exposed to perish, more feeble if it vegetates, and more tardy in its early progress. To obtain a prolific crop, with early maturity, it is essential not only that the seed should be good, but that it should have some extra stimulus to induce a healthy and vigorous outset. Under a favorable commencement it is better enabled to overcome all the impediments in its course. To those who have spread all their manure, I ean recommend no better substitute than equal parts of moderately leached ashes and plaster, well mixed, and as much as can be thrown in at once by the hand.

With respect to smut, my rule is to have it removed wherever it appears, as soon as discovered. By this practice a sound ear may often be saved which otherwise would have been blighted. It prevents the filth and dust from contaminating the ears and those who harvest it, and an annoyance, if not an injury to the stock that consumes it.

Yours with respect, Worcester, Oct. 29, 1828. O. FISKE.

> OFFICIAL REPORTS. OF THE

MASSACHUSETTS AGRICULTURAL SOCIETY.

The Committee of the "Massachusetts Society for the Promotion of Agriculture" consisting of Messrs. LUKE FISKE, ELIJAH PERRY, and AMOS LIVER-MORE, who were appointed to consider the several claims for premiums on Working Oxen, have altended that service, and Report ---

That for the five premiums offered by the So-

tered, each deserving much credit; although it fered by Gorham Parsons, Esq. that were justly was out of the power of the Committee to award distinguished for their superior form, quantity and

reference to age, size, docility, equality of match. activity and form; and after a eareful examination, and trial of their power and training, they award as follows, viz .-

To Heury Mellen, of Milford, his cattle four years old, first premium

To Hiram Copeland, of Easton, his cattle four years old, second premium 20 To Asa Cummings, of Sutton, his cattle four years old, third premium

To Silas Dudley, of Sutton, his cattle five

To William B. Harrington, of Grafton, his cattle five years old, fifth premium

All which is respectfully submitted. For the Committee,

LUKE FISKE, Chairman. Brighton, Oct. 15, 1828.

12

The Committee appointed to award premiums on Sheep and Swine Report-

That they do not find any merino buck entitled to the first premium.

They award to George M. Barrett, the second premium, for a merino buck To Joseph Barrett, the first premium for

the best merino ewes To George M. Barrett, the second premi-

um for the next best ewes To John Mackay, the first premium for the

best boar To Silas Dudley, the second premium for

the next best boar To John Mackay, the first premium for the

To George M. Barrett, the second premium for the next best sow

To John Mackay, the third premium for the next best sow

To John Mackay the first premium for the best pigs

To Joseph Barrett, the second premium for the next best pigs

The Committee were highly gratified to observe an improvement, this year in the number, form, and fineness of fleece in the sheep, and in the number and quality of the swine. And they are principally indebted for the improvement in the our readers. We will, however, extract some of sheep, to the perseverance, and intelligence of Messrs. Joseph Barrett and George M. Barrett, of Concord, Mass.

The characteristic marks of a good hog, and a good proportion of them, well adapted to the respective breeds and varieties were observable in all the swine, that were exhibited. Those produced by Mr John Mackay were distinguished for great production for several successive years, for small bone, fine flesh, lively activity and excellent condition, as well as for their kindly disposition to eaves of a house, or to the inner sides of a chimfatten early and easily. There were some peculiarities in those brought by Mr Dudley and Mr goes no further than to secure a firm roof, to which Barrett, that deserved particular attention, for they evidently show sound judgement in the selection, and good management in keeping.

The Committee had great pleasure in noticing the several pens that were filled with sheep by the several pens that were filled with sheep by

The race is principally confined to the moor in the County of
the friends and benefactors of the Society, and
Devon, whence the sheep derive their name. The wool is long,

were four merino ewes and one Saxony buck offineness of fleece; and four excellent ewes from The Committee proceeded to compare them in the Netherlands, that were presented to the Society by the Hon. THOMAS H. PERKINS, and also a buck and ewe of the Dartmoor or Devonshire Natts breed,* that were presented to the Society by Gen. John Coffin; all of them attracted great attention, and were deservedly held in high JOHN HEARD, Jr. estimation. SAM. JAQUES, Jr.

FOR THE NEW ENGLAND FARMER.

POTATOS.

Ma Editor-There has been a potato raised in Windbam County, (Con.) for about twelve years, which was imported from England; I believe they are likewise raised in Rhode Island .-They are called Irish Whites, are white inside; the shape is generally longer than the English Whites. They yield well on good land-are of a middling size, and should be planted as early as possible in April to have time to ripen. They are esteemed, I believe, by all who have raised them, as superior for the table to any they have ever seen. They much resemble those potatos described in N. E. Farmer, vol. vi. p. 337, called Rogers Potatos, except that I never saw any red spots on them. It may be, that the same kind or others equally good are raised in the vicinity of Boston, but I bave never seen any Potato there that I considered fit for the table. Please to try a few of these I send you, for your own satisfaction. .. Connecticut, Oct. 26, 1828.

Remarks .- We have eaten of the above Potato, and according to our taste, (and de gustibus non est disputandum, anglice, there 's no disputing our taste,) the Irish Whites are the very ne plus ultra of all possible potatos .- EDITOR.

> (Prepared by the Editor.) BEES.

An able and very useful review of " The Farmer's Manual, including a Treatise on the Management of Bees, by FREDERICK BUTLER," was published in the last number of the North American Review. We would republish at length this valuable essay, were we not pressed for room, and sensible that it is already in the hands of many of the most practical observations, which may prove beneficial to some, who are not in the habit of perusing the work from which they are taken.

"A hive ought uct to be considered as the house or habitation of the bee, for even in the forests, where there may be supposed to be abundance of hollow trees suited to their purposes, bees have built their cells on the under side of a stout branch; and they have neglected the convenient form of a well constructed hive, to attach themselves to the they can attach the cells, and a firm position that shall protect the cells from the sun and rain.

* A specific character of the Dartmoor or Devoushire Natis sheep. Faces and legs white, necks thick, bones large, backs narrow, but back bones high and sides good.

which were offered for exhibition only. There weighing nine pounds on an average, at about two years and a half old.

and most unsuitable tenements for the construction of cells. A hussar's cap, so suspended from a moderate sized branch of a tree, as to be agitated by slight winds, was filled with comb and bees. Any thing, in short, either near the habitations of | nal,' contains in a small compass, as much of the man, or in the forests, will serve the bees for a shelter to their combs.

"We have, for seven years, had a little colony under our immediate inspection, and we began our personal observation with the knowledge of all that ancient and modern theorists have advanced, in relation to the habits, customs, and manners of this wonderful insect. We came to their superintendance with a mind tinctured with all that was marvellous and fanciful, and with an ardour that seven years have not subdued; altho' theory after theory has now melted away, and most of the wonders and enigmas have been solved, and reduced to the clearest and most simple particulars. Our wonder and admiration, altho' deprived of the charms of the fanciful legends in which the history of the bee was embodied, are still undiminished, nay, increased; for an elevation of thought and feeling has been produced by the study.

"After rejecting all the fanciful and marvellous speculations of the theorists, there are still several material points unsettled, on three of which we propose to make a few remarks at the present time.

"1st. The most modern and the most rational theorists differ in their opinion respecting the accuracy of the facts, that are stated in relation to the queen bee's leaving the hive at any other time, than when she goes forth with a new swarm.

"2d. They dispute, likewise, on the possibility; of the bee's making a queen bee from a neuter, when circumstances require it.

"3d. They are still ignorant, whether the drone perform the office of nurse to the larvæ when deposited in the different cells.

"On the first point we venture to state unhesitatingly, that the queen bee never leaves the hive, but when she accompanies a swarm." The writer then states the facts and observations, which enabled him to arrive at that conclusion, which occurred during six successive years. With regard to making a queen bee from a neuter, he observes that

"When a queen bee ceases to animate the hive. the bees are conscious of her loss; after searching for her through the hive, for a day or more, they examine the royal cells, which are of a peculiar construction and reversed in position, hanging vertically, with the mouth underneath. If no eggs nor larvæ are to be found in these cells, they then enlarge several of these cells, which are appropriated to the eggs of neuters, and in which queen bees have been deposited. They soon attach a royal cell to the enlarged surface, and the queen bee enabled now to grow, protrudes itself by degrees into the royal cell, and comes out perfectly formed to the great pleasure of the bees.

"The third point unsettled, and which is likely to remain forever a secret, is, whether the eggs of the queen are hatched after the manner of the eggs of fishes, whether they simply are animated by inenbation, or by the care and nourishment bestowed on them by the working or neuter bees. On this point experiment ha proved nothing .-

"This faculty or instinct, is sometimes at fault; The greatest diversity of opinion exists. There placed in valleys or elevated on hills, meaning of for we often hear of their adopting the strangest are upwards of a thousand writers on the history course of thirty or forty feet in height. and policy of the bee, yet no two have either observed or reasoned alike.

> "The little work, the title of which we have prefixed to this article, called 'The Farmer's Manminutize of the management of bees as is necessary multiplied equally well under an open shed; but to the common cultivator. Mr. Butler is a sensible, practical writer, as well on other branches of health and comfort, we have never known them rural economy, as on bees, and we would recom- to thrive when quite enclosed. A house, theremend his book to all who are engaged in these pursuits; for, with some slight variation from his rules, such as a different climate would indicate, his experience may be beneficial to all."

The following practical remarks of this author are more particularly worthy of the attention of all who own or have the care of bees.

"We esteem it a very desirable object to make the care of the bee more common than it has springs and shallow rivulets appear at every turn. There is no doubt that bees were formerly more and we find that it is mostly attributable to the most wretched manner.—Hamp. Gazette. millers, or night moths, which have of late years spread destruction through the hives.

"The attention of naturalists has been directed many attempts have been made to construct hives that would prevent the miller from depositing its eggs in them; but the plans were defective, heior and to free it from all extraneous matter, as

"On the general subject of the care of bees, the 55 and 29 dollars. following remarks, the result of personal experience, may be acceptable to the reader.

"The situation of the apiary is of little importance. We have seen bees thrive as well with an eastern as with a northern aspect. 9 If the entrance of the hive face the north, the bees may possibly be detained within, a minute or two later in summer; but this is more than counterbalanced by the same cause operating in winter, when it is desirable that the bees should remain in the hive. But for ourselves, we have seen no difference in the time of quitting the cells hetween accounts for the forbidding aspect which our good those that faced the north, and those that had the New England people wear towards strangers, by southern exposure. Nor have we observed that supposing that it is produced by drinking vile sour there is any difference in the welfare of hives as eider.

"We have seen hives prosper, adjoining a stercorary, and oftentimes near a piggery. We have known colonies of bees to exist for a term of 20 years, with no other protection from the heat and the cold, than the top of the hives. They have as a free circulation of air is necessary to their fore, strictly so called, which is shut on all sides, may serve to amuse the observer for a year or two, but there must be an extraordinary combination of fortunate circumstances, if the bees increase, while confined in it."

(To be continued.)

NORTH CAROLINA GOLD.

A correspondent of the N. Y. Statesman supposes that the gold region in this country forms a hitherto been, in this part of the country. With belt on the cast side of the Blue Ridge, extending the exception of a small one under the superin- from Georgia through South Carolina, North Cartendance of the Society of Shakers, established at olina, Virginia and Maryland, to the Susquehanna New Lebanon, we neither saw nor could we hear in Pennsylvania. In North Carolina it is about of more than a single apiary, on a journey last 70 miles wide. The gold is found in three posisummer to Lebanon springs, although we made tions-in alluvial heds washed in former times many inquiries. Never was there a country more from elevated regions; in ranges of white quartz, suited to the cultivation of bees. Even in August (flint stone); and in white quartz now forming there is an abundance of white clover, and small veins in argillaceous rock. The mines should be called iron mines; gold is associated with the iron, but the iron is fifty times as abundant as the gold. frequently kept in America than at present. In It is estimated that there are 50,000 places in many places in New Jersey, where there is now North Carolina where gold may be found. The scarcely a bee to be seen, there once existed mil- miners and gold diggers get from 60 cents up to lions of these insects, to the great profit of their two or three dollars per day, each. They are owners. It was common for one dealer in a coun-generally a worthless, drunken people, without try town, to sell from fifteen to twenty barrels of character, science, skill or capital. When they strained honey alone-to say nothing of wax and have worked a week, they resort to some whiskey comb honey, as well as a kind of wine, made of shop in the neighborhood, and squander their goldthe washings of combs, called metheglin. These en treasures in rioting and drunkenness. Each articles of commerce have almost disappeared, operation about the mines is conducted in the

AMERICAN INSTITUTE.

The sale of articles, exhibited by this associato the history of this fatal enemy of the bee, and tion, took place on Saturday, and attracted an immense crowd of spectators and purchasers. Many of the articles were sold, some of them at high prices. Among them we were informed that the eause there was no contrivance for inspecting the broadcloths of which we made mention in our hives. Before we close this article, we will en- paper of Saturday, sold at from 6 to 8 dollars per deavor to give a description of a hive, that is so yard; and three pianos, the manufacture of Duconstructed as to enable any one to see the inter- bois & Stoddard, at the high prices of \$475, \$330 and \$295. The blankets, many of which were well as to protect it from the inroads of the night fine specimens, sold for from 5 to 9 dollars the pair and two of the Long Island Leghorns brott

> Thus it will be perceived, that splendid encouragement is given to the native manufacturer, by our wealthy citizens, to go on and improve his products. The excess of price given on such an occasion, is a patriotic sacrifice to the cause of domestic industry. That the time will come when most of the manufactures, which we now obtain from abroad, will be supplied cheaper at home, we have never doubted .- N. Y. Statesman.

Plausible Theory .- The Williamstown Advocate

PENNSYLVANIA HORTICULTURAL SOCI-ETY

At the meeting of the Horticultural Society of Pennsylvania, on Tuesday evening last, the memhers were highly gratified with a fine display of way as a jam: add the juice of a lemon: this autumnal flowers. Among the most striking of makes a very good towit. those from the gardens of the Messrs. Landreths. were Dahlias, from Mexico, of almost every shade, from a pure white, with yellow centre, to a brilliant purple; a beautiful species of Eupatorium; several varieties of golden rod, [Solidago;] a rich you please; it does for ornament in the dessert. species of American strawberry tree [Euonymous,] scarlet sage [salvia splendens,] &c.

From the same establishment were produced several new and beautiful varieties of seedling roses, tea roses, amaryllis from Mexico; golden trumpet, honey suckle [Caprifolium Fraseri,] with other flowers, which attracted attention. Among those not already mentioned, was a flowering branch of the Franklinia [Gordonia pubescens] This elegant of distinguished individuals that had been confintree was brought from Florida by the late Mr. John Bartram, and may well be ranked among the most agreeable ornaments of our gardens and lawns; it is at present flowering in the Messrs Landreth's garden, on Federal street, and has been constantly in bloom for more than three months past. A variety of other flowers were reported to be now in bloom, among which were splendid Dahlias, Campanula pyramidalis, &c. at tho gardens of A. Parker Prime street, and D. Maupay, on the Germantown road .- U. S. Gaz.

TOMATAS.

The following recipes were taken from an eminent French cook :

Tomata sauce for cold meat .- Boil tomatas when ripe, rub them through a tammy cloth; to every quart of pulp add 1 ounce of garlick and I ounce of shallets; boil half an hour; strain out the garlick; add to every quart half a pint of common vinegar, and a wine-glass full of Chili vinegar; let it stand a day or two before corking.

Potted Tomatas .- Reduce your tomatas over the fire till they are quite thick, stirring all the time to keep them from burning; rnb them through a tammy cloth, put them again in your stewpan, with an equal quantity of glaze, and reduce again over a sharp fire till you think the whole will be quite firm when cold, (or like glaze ;) put them in a white earthen pot; when cold cover them with a writing paper dipped in brandy; over some warm hog's lard, and cover all over with a bladder tied quite tight. A small piece added to a little gravy, or melted butter, will make an excellent sauce for cutlets or chops.

them; rub them through a tammy cloth, put them ders to muster. when cold into fruit bottles; they must be corked very tight and tied down; put the bottles nearly up to the cork in cold water, over a gentle fire, till the value of codfish, salmon, shad, mackerel, herthey boil; then set them on one side till cold ;of bees' wax, rosin, &c. This may be used in four millions of dollars. making sauce for cold meat, or as above, by adding strong gravy. It is intended of course, to save the glaze.

Tomatas with gravy .- This is simply stewing your tomatas in a little good gravy till quite tender, keeping them whole; drain them on a sieve, dish shem up, and pour a little half-glaze, and a teathem.

Tomatas may likewise be put into vinegar as a

Towit of Tomatas .- Take a pint of the tomatas, add a pound of fine sugar, reduce it in the same

Tomatas as a dried fruit ... The pulp may be reduced, say a pint, with a pound of fine sugar, till quite stiff; pour it on your tin; it must be dried in a stove; when nearly dry, cut it what shape

THE BASTILLE.

A pamphlet has lately appeared at Paris, containing divers interesting particulars respecting the Bastille. Its foundation-stone had been laid on the 12th April, 1369, and, on the 14th July, 1789, the last stone of this building disappeared. Amongst other things, this pamphlet contains a list ed in the Bastille, with copies of the warrants which M. de Sartine, Lieutenant of Police, had transmitted to the Governor. One of these runs as follows :-- "I send you M. F-; he is a goodfor-nothing fellow. Take care of him for one week, and then get rid of him." At the bottom of this paper is the following note, in the Governor's handwriting :- " On the - June M. Farrived; and after the expiration of the appointed time I sent to M. de Sartine to enquire under what name I should have him buried."

MAPLE SUGAR.

The New York Daily Advertiser of Saturday, observes, "a new article of commerce is noticed in our Review of the Market. Upwards of 300 barrels of Maple Sugar have been received by the Canal, which has been sold at five cents a pound. Last season we understand, a parcel of about 70 barrels was received. It is supposed the manufacture of this article will increase and that it will soon be one of considerable importance. The supplies of Sugars from New Orleans have already increased to such an amount that they are rapidly taking the place of foreign sugars, and it is supposed by many intelligent persons, that in a very few years the supplies from New Orleans and elsewhere, will be sufficient for the consumption and that no foreign sngar will be required.

U. S. Gazette.

MILITARY MUSTERS.

A brigade review of the 5th division of the Massachusetts militia, was ordered at Berkley on the 7th inst. Nearly every company, the residence Tomatas quite plain.—Reduce as before, only of whose members was more than fifteen miles be more careful in evaporating the water from from the place of parade, refused to obey the or-

Massachusetts Industry. It is ascertained, that ring, oil matter, &c. annually taken from the take them out and dip the cork in good cement, ocean by the fishermen of Massachusetts, exceeds

MARYLAND CATTLE SHOW.

The annual fair of the Maryland Agricultural Society was held at Carroll's Point, near Baltimore, on the 16th inst. The collection of cattle was numerous, and comprised a variety of the finest breeds. The exhibition of domestic manufacspoon full of vinegar mixed with it, quite hot, over tured articles was more limited than on previous similar occasions.

Shoe Blacking .- Large sums are annually paid by our fellow citizens for the article of shoe blacking, a considerable portion of which goes to enconrage foreigners. In confirmation of this asseriion, it is stated on good authority, that there is annually imported into this country from England, shoe blacking to the amount of \$2,000,000, the chief part of which is made by Day & Martin, of London. This large sum might easily he kept in this country, and even in the pockets of those who have heretofore been in the habit of paying their portion of it, by each family's making their own; which can be done with very little trouble, and at small expense. Day & Martin's blacking is prefcrable to any other, as it gives a high polish, and does not injure the leather. It is made in the following manner:

To one pound of ivory black, in which has been mixed half an ounce of oil of vitriol and an ounce of sweet oil, add one pound of pulverized loaf sugar; mix the whole with a gallon of vinegar, and let it stand three days, when it is fit for use. It should be stirred often, and kept from the air to prevent evaporation. The cost of a gallon of this blacking is 75 cents; and it is retailed at the stores for 4 dollars .- Williamstown Advocate.

RAIL ROADS.

We have, on our first page, called the attention of our readers to an interesting letter from a gentleman in England on the subject of Rail Roads.* No man can read this and similar accounts of the successful operation of Rail Roads wherever they have been constructed, without wishing to see them adopted more generally in our own country and particularly in our own State. The public mind has been gradually preparing for such an enterprize in Massachusetts, and the experience of their utility will, we trust, soon dissipate any doubts of the expediency of the measure. The Report of the Directors of the Baltimore and Ohio Rail Road Company has recently been published, and flattering and encouraging accounts are given of the progress of that great work. So great is the confidence entertained of its ultimate success, that a capital of four millions has been subscribed; and, of this, two millions have been taken up since the last annual Report-the State of Maryland having become a subcriber for five hundred thousand dollars of the stock.

The preliminary measures, in regard to our Rail Road, are nearly completed, and the people of the Commonwealth will soon have an opportunity of judging, more accurately than at present, of the necessity and expediency of doing something to advance her prosperity. We look forward with much interest to the Report of the Board of Directors of Internal Improvement, which will be early made to the Legislature, as we doubt not the facts and arguments which they will be able to offer will remove the doubts of the most sceptical, We long to see Massachusetts awake to her interests. Her wealth and population and resources are adequate to any enterprize that her interest suggests. It is not the richness of her soil that constitutes her greatest wealth; but it is her industry, her mineral resources, her manufacturing and mechanical capacity and power; and these can be fully developed only by means of internal improvements-by roads, canals, and Rail

* The article adverted to by the Editor of the Yeoman, we shall soon present our readers.

ways. If she would even keep her own trade, and command the resources already developed, Massachusetts must do something, and that shortly, to prevent the tendency to diversion which her natural situation presents.

A RAIL ROAD through the State would be a small work for the State to accomplish. Look at it, a moment. Compare it with the works of improvement which the people of villages, and which individuals, are constantly undertaking and easily accomplishing. Go into one of our thriving manufacturing villages, where a handsome Meeting house has sprung up, as if by enchantment. This work, easily as it has been accomplished, was a greater undertaking for its projectors than would be a Rail Road for the State. Look at the improvements in the principal street in this village.
The mere paving of a side walk is a greater work for the owners of the House lots by whom it has been done, than a State Rail Road from Boston to Berkshire. A direct tax upon the people, for the whole expense of such a road, would not fall heavier on individuals than the tax which has been readily incurred in improving half a mile of the highway through the centre of this town. But then there would be no need of such a tax. The credit of the State would accomplish it; and all the effect which the people would feel, would be in the benefits derived from the expenditure of the money necessary for its construction, and from the use of the road when completed---Worcester Yeoman.

PEACHES.

A few days since Mr. Josiah Allen, Jr. of Attleboro', exhibited in our market among the variety of other fruit, a quantity of the Heath Peach, render them useful as external irritants, or as subwhich he has cultivated in his orchard. Of this stitutes for blistering flies. delicious fruit the following description is given in Thacher's Orchardist :- " Of all peaches -of all fruits, it is said there is none equal in flavor to the weighing near a pound, in common. It is generally the last sort that ripens."

Mr. Allen, we are informed, has taken great which he now realizes ample remuneration.

Pawtucket Chronicle.

SQUIRRELS.

These animals are making great havoc among the crops in Illinois, Indiana, &c. One man killed 400 in his field in one day, and the next morning they were as numerous as ever. They are constantly swimming across the Wabash, Ohio, & Mississippi rivers, and are killed by the boys in great numbers at their landings. They swim across rivers from a mile to a mile and a half in width .- Hamp. Gazette.

SILK WORMS.

Mr. Abbott, of Leominster, Mass. after successful experiments in the raising of silk worms, and obtaining their silk, has this year set out several hundred white mulberry trees, in further pursuit of this enterprising and amusing employment.

BUFFALOES.

The only heasts used for draught by the European Turks are buffaloes, and cream colored oxen. The buffaloes are huge, clumsy animals, and the Turks never eat their flesh except on one occasion. Strings of blue beads are hung about cordate, elytra blackish purple, antennæ and ventheir horns and neck to preserve them from the tral segments fuscous. effects of the evil eve.

CONTRIBUTIONS TO ENTOMOLOGY. BY THADDEUS WILLIAM HARRIS, M. D.

No. II.

Family Carabida.

This extensive family contains numerous species which are arranged under various genera. The perfect insects usually conceal themselves during day under stones, and fly abroad at night. Like the Cicindelæ they live by rapine, and devour such insects as they can conquer, not always sparing those of their own family. Some species are to be found in the day-time searching for their prey in highways, or on plants. Some inhabit beneath the bark of trees, and a few appear to feed on the pollen of flowers. Most of them exhale an offensive odour, which remains on the fingers a long time after handling them. Others emit from the mouth or tail a caustic acid liquor, highly volatile, and irritating to the skin. Having incautiously taken up CARABUS sylvosus it assailed and abdomen castaneous, thorax canaliculate, elyme with a sudden jet of this fluid, several drops tra sulcate, antennæ compressed. of which reached my face, produced an acute scalding sensation, and left spots which remained inflamed for some hours. The species of the tieths of an inch. genus Brachinus have been long celebrated for most fetid vapor from the ordinary passage." This is the insect's mode of defence against its assail-

are predaceous; they are serviceable in destroying smaller insects and caterpillars, and do not American Heath Peach, a clingstone. It is large, attack or injure vegetation. They dwell in the nut colored, paler at base, widely grooved, the ground, but some of the larger kinds have been grooves punctured, obsolete at tip; external subfound on trees, inhabiting the nests of caterpillars, and committing great havor among them. The pains to procure the most choice kinds of fruit, for redoubtable enemy of the cut-worm appears to be tus and feet reddish buy, ventral segments castaone of the family.

> The general shape of the larva is long, linear, flattened above, with strong curved jaws, six legs near the head, a distinct thoracic shield, and an anal proleg. They are blackish in color, and active in motion.

GENUS BRACHINUS.

B. *medius. Testaceous, elytra, dull reddish purple, obsoletely and broadly striated, antennæ fu-

Length five twentieths of an inch.

Body pale ferruginous or testaceous, with very short, decumbent, pale, ochreous hairs. Head with rugose impressions near the antennæ. Two first joints and base of the third joint of the antennæ testaceous, remaining ones fusccous. Anterior angles of the thorax obtusely rounded, disc very convex, with deep medial and submarginal impressed lines. Elytra somewhat polished, reddish purple, with six or seven obsolete and shallow strice. Feet ferruginous, body beneath darker. It is found beneath stones, and is sufficiently distinct from others by the regularly curved anterior angles of the thorax.

B. *minutus. Thorax dark ferruginous, oblong-

Length one fifth of an inch.

Head, thorax, and feet dark ferruginous, almost castaneous. Antennae fuscous, except the two basal joints which are ferruginous. Head with two longitudinal indentations between the eyes. Thorax oblong-cordate, anterior angles subacute. disc very convex, middle longitudinally impressed. Elytra blackish purple, with a greenish tinge, obsoletely striate the alternate interstitial lines more elevated than the intermediate ones. Body beneath castancous-brown, ventral segments fus-

Inhabits beneath stones, but is rare. The shape of the thorax approaches to that of the crepitans. Our most common species is the fumans, F., which somewhat resembles the above in colors, but is over half an inch long.

GENUS ZUPHIUM.

z. *bicolor. l'ubescent, reddish-bay; coleontra

Length over eleven twentieths of an inch ;breadth of coleoptra between three and four twen-

Body reddish bay, with short decumbent, fertheir crepitating powers. Mr. Kirby calls them ruginous pubescence. Head punctured; a lateral "the true counterparts of the skunk, exploding a longitudinal impression each side near the antennæ; neck distinct, impunctured; second and third joints of the antennæ nearly equal in length, and ants, which it bombards with repeated discharges with the first obconic; terminal joint flattened, of smoke and noise, gun-boat like, from behind, oblong, rounded at tip; intermediate joints trans-The American hombardiers are fully equal, in this verse, gradually broader to the penultimate one, respect, to foreign species. The Carabidæ were and laterally compressed. Palpi with obconic employed by ancient physicians as internal reme-joints, the terminal ones largest and truncate at dies in various diseases; their acrid qualities might tip. Thorax cordate, truncate before and behind, rather wider than long, anterior angles rounded, posterior ones slightly excurved, subacute; dise But few of the larve are known. Their habits deeply and distinctly punctured, and longitudinally canaliculate. Coleoptra parallelogramical, basal and external apical angles rounded, disc chesmargin with a few, remote, larger, ocellate punctures. Body beneath punctured, pectus postpecneous. Tarsi with entire joints.

This insect must be very rare. The specimen from which this description is taken was presented me by Charles Pickering, M. D., who found it in the vicinity of Salem. Some doubts existing respecting the propriety of placing it in the genus zurhium, the characters of the species are detailed particularly with reference to elucidating the genos, no other species of which I have seen-

GENUS HARPALUS.

н. *sericcus. Black, punctured, pubescent above; antennæ annulated with reddish-brown and fuscous; thoracic angles rounded; tibiæ aud tarsi reddish brown.

Length of the male two-fifths of an inch, of the female rather more.

Body depressed, brownish black, opaque, with distinct large punctures, and short, decumbent. ferruginous pubescence above. Mandibles castancous, palpi and three basal joints of the anteunæ reddish bay, each of the remaining ones of the same color at the tip, and fascous at base. Thorax distinctly margined, angles rounded, the posterior ones very obtusely; disc not much elevated. dorsal and basal lines obsolete, and in the place of the latter a broad, shallow, confluently punctured depression, uniting with the dilated lateral

series of punctures indistinct; apex of the elytra sinuate. Body beneath and thighs black, polishished: 'tibiæ and tarsi, reddish brown or bay.

This insect is very common on grass during the warm days of summer. It somewhat resembles н. herbivagus, and probably also н. faunus, Say; but is easily recognized by being entirely punctured, and sericeous above, by its more rounded thorax, its dark thighs, and annulated antennæ.

REMARKS .- It may happen that some may object to the technical language of descriptions. For brevity, as well as to answer other purposes of science, this is unavoidable, and to those, (and we trust they are many) who make Entomology a study it can be no disadvantage. The terms are explained in Samouelle's "Compendium" before mentioned, in Kirby & Spence's "Ontlines to Entomology," and in the "Glossary to Say's Ento-Piology.

No popular names of species are given because none are known, and because a scientific name is more appropriate and as easily remembered .-The advantage of a name is obvious, and has the authority of Linnæus, who says that, without one, a knowledge of facts is lost. "Si nomina nescis perit et cognitio rerum." The supposed new insects have an asterisk prefixed.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 31, 1828.

GATHERING and PRESERVING POTATOS. With regard to the time in which potatos should be gathered, we find some difference of opinion among practical farmers. It is, however, acknowledged by all, that when intended for consumption and not for seed, they should not be gathered till they are ripc. The ripcuess of the potato may be perceived by the appearance of the tops, which will begin to decay as soon as the roots have attained to maturity. After that period, we are told by some cultivators it is important that the potatos should be gathered and housed as soon as convenient, or immediately after the tops are decayed, either by ripeness or frost. Others say they will keep best in their native beds till the ground is frozen. But, at any rate, it is best not to defer digging till very late lest cold weather should destroy or lock them in the ground till spring. The old fashioned mode of harvesting potatos, was to dry them in the sun as you would grass for hay. Rees' Cyclopedia says, "as soon as potatos are gathered they should be allowed to remain some days to dry before they are stored." This we believe to be wrong, for in our climate, an exposure of two or three days to a cloudless sun, in September or October, would cause potatos to turn green, to taste strong and bitter and become in some degree poisonous. It is now said by practical farmers that the less the roots are exposed to sun or air, after being taken from the ground the better, and that it is advisable to grown to adhere to and mix with them, when they are deposited in their winter quarters. It my family the last of September. I dug the re- tables are retained; by burning nearly all of them

tos immediately after a "soaking" rain, but to let ed one bushel to five hills, size like those I send. them remain a few days in the hills, to get rid of you. The Common Potato, planted side by side, their superfluous moisture, which will in due time took thirty hills to the bushel." say some philosophers, he expelled by the vital energies of the roots, unless the ground is very wet, which might cause them to rot.

Mr. Buel, of Albany, who is a practical as well as a scientific cultivator, says, "it were better that the sun never should shine upon potatos-that they should be housed with all the dirt that ad-Lerata in the First Number—Page 90, column 2, line 32, for expraval read reprach—line 31 for description, read descreptions, column 3, line 40, for pupa, read pape—line 43, for bunch, read line 61, after behind, insert with—page 91, column 1, line 20, for substarted, read substurd—line 41, for lips, read line 62, for punctulata, read punctulata.

The Hon. O. Fiske, in an address to the Worcester Agricultural Society, in speaking of the potato, observes that "nature has not accomplishits maturation at the period in which the vines decay, and the farmer believes it to be ripe. It its growth. That potatos, which have remained the whole season in the earth, are more farinaccous and pleasant has been ascertained. A farmer in this town, who was in the practice of planting a large quantity, took his family supply from a spacious field, early in autumn. As the residue was intended for his stock, he deferred harvesting them till a late and more convenient period. During their consumption, his table, by mistake was furnished with some which had been destined for the barn. The quality was so obviously superior as to lead to an investigation of the cause. From that time the two parcels received an exchange of destination. Another fact illustrative of this position was stated to me by an eminent farmer in the vicinity of Boston. A distinguished agriculturist, from Scotland, who had dined at the best tables in the city and its neighborhood remarked, at the hospitable board of my informant. that he had not seen in this country, what, in Scotland would be considered a good potato. He imputed their difference to the different mode of cultivation. There they plant early and dig late."

The most expeditious way of gathering a potato crop, is, first to run furrows on each side of the rows, and then a deep one in the middle, which turns up most of the roots to the surface. In this way, however, we should apprehend some waste, and should not recommend it, except where potatos are plenty and labor scarce. A hoe with prongs, such as is sold at J. R. Newell's establishment, 52 North Market-street, Boston, we believe to be the best implement for digging potatos.

SWEET POTATOS.

Since our notice of Mr Pond's success in raising the Carolina Potato, we have received several specimens from different cultivators in this vicinity, among others, some very superior ones from Mr J. Tipp, of Roxbury, and Mr A. Houghton, Jr. of Lynn. One of our marketmen informs us they were never known to be so abundant in this part of the country. Mr Houghton accompanied his with the following remarks. "The Carolina Potato slips purchased at the New England Farmer Seed Store have done finely. The largest of those now sent you, when first dug, weighed 23 permit some part of the soil in which they have pounds. I purchased four quarts of slips with which I planted 60 hills-began to use them in

margin. Elytral striæ impunctured, submarginal may be best, however, not to dig and house pota- mainder a few days since. Those last dug yield-

CATTLE SHOW AT MANSFIELD.

The annual Show of the Bristol County Agricultural Society, took place yesterday at Mansfield. The unfavorable state of the weather in the morning probably prevented the attendance of some, and lessened to some extent the Exhibition. It was nevertheless, numerously attended, and altogether was a respectable exhibition. At the Ploughing Match in the morning 9 teams were entered, which executed their work in a manner creditable to the competitors. The show of neat cattle was equal probably to those of past years. The pens, which were the same which have heretofore been used for this purpose, were all filled, several of them with fine animals of foreign and mixed as well as domestic breeds. There was a variety of manufactured articles exhibited, alprocess, perfects its qualities after it has attained though not a very large quantity. The show of cloths was small. Among the rare productions exhibited were specimens of sweet potatoes raised by Rufus Bacon, Esq. and by Dr. Green. At twelve c'clock the Society moved in procession escorted by a band of music, from Maj. Bates' to the Meeting house. A prayer was offered by Rev. Mr. Briggs; after which the Society were entertained for upwards of half an hour by an address eloquently delivered by A. A. Locke, Esq.-The Society returned to Maj. Bates' where an excellent dinner was provided. Toasts were drank with very good wine manufactured and presented for the occasion, by Noah Claffin Esq. of Attlehorough and Dr. Roland Green of Mansfield. The reports' of the Committees &c. will be published in a future paper .- Taunton Register.

MANURES

Assist plants, by destroying predatory vermin and weeds. This, however, is not a property of animal and vegetable manures; they foster both those enemies of our crops. Salt and lime are very efficient destroyers of slugs, snails, grubs, &c. It is astonishing how ignorantly neglectful are the cultivators of the soil, when their crops are devastated by the slug, not to dress them so as to render the surface of the soil quite white, during a promise of a few days dry weather, with caustic lime. It is instant destruction to every slug it falls upon, and those whom it misses are destroyed by their coming in contact with it, when mov-, ing in search of food. It is a common practice to burn couch-grass, docks, gorse, and other vegetables which are very retentive of life, or slow in decay; a more uneconomical, unscientific method of reducing them to a state more beneficial to the land of which they were the refuse, cannot be devised. In breaking up heaths, such exuviæ are very abundant; but, in all cases, if the weeds. leaves, &c. were conveyed to a hole or pit, and with every single horse-load, and with barrowloads in proportion, a bushel of salt and half a bushel of lime were incorporated, it would in a few months, form a mass of decayed compost of the most fertilizing quality; the lime retaining many of the gases evolved during the putrefaction of the vegetable matter, and the salt and it combining to destroy noxious animals, which might form a nidus in the mass. By this plan, nearly all the carbonaceous matters of the refuse vegeas that recommended, is justified and approved by the experience of many.

Stable manure, and all decomposing animal and the decay of stubborn organic remains in the soil, on the principle that putrescent substances hasten the process of putrefaction in other organic bodies with which they come in contact. Salt, in a small proportion, has been demonstrated, by Sir J.

ringle to be gifted with a similar septic property; and that lime rapidly breaks down the texture of organised matters is well known.

There is no doubt that rich soils, or those abounding in animal and vegetable remains are less liable to change in temperature with that of the incumbent atmosphere, than those of a poorer constitution. This partly arises from the influence of the color of soils on vegetation. Some manares, as salt, protect plants from suffering by sudden reductions of temperature, by entering into their system, stimulating, and rendering them more vigorous, impregnating their sap, and consequently rendering it less liable to be congealed. Gardener's Magazine.

On the Cause of Curl in Potatos .- It is stated by a writer in the Gardener's Magazine, that the curl in potates is occasioned by the depredatious of a small worm. He says, that they lodge at the bottom of the stem, which, for an inch or more, is changed from its natural to a pale unhealthy colour; the ascent of the sap is obstructed, and the leaves not having a due supply, are deformed and diminutive. That in examining the cut of the potato he discovered a small hole, which probably was the place where the egg had been laid, and where the worm was bred. For avoiding the evil he advises to prefer unripe sets to fully ripe ones, as a preventive where the curl is dreaded, which remedy has been proved by his own experience to be efficient. The use of unripe potatoes for seed has likewise the advantage, according to this writer, of giving a crop a month or six weeks earlier, than when sets are used which were fully ripe at the time they were gathered.

Vessels for eider .- The cheapest and best vessels for containing cider, are said by some to be white oak iron-bound hogsheads, made of heart with oak fron-bound flogsheads, made of heart; phowever of the Profession, and can produce recommendations stuff well painted and of a size to hold about there barrels and an half. These vessels should be smeared over with a little spanish brown and lates to produce a shuation in New England or the Middle be smeared over with a little spanish brown and lates, once in about three years. Charge Farmer, Beston, or G. Therburn & Son, New York. lamp black, once in about three years. Others recommend vessels for keeping cider in which the barrel boards are straight, but the vessels broader at one end than the other, to be set on the smaller end, with the bung-hole at the top. The advantage of this form is, that in drawing off the cider, though but slowly, the skin or cream, contracted by its fermentation, descends and covers the liquor and thus preserves the fixed air in the cider till the whole is drawn off.

Searing small Birds from destroying Garden Crops .- A writer in the Gardener Magazine says "Having repeatedly lost my whole crop of peas by the birds nipping off the tops immediately on their appearing above ground, I, to prevent this, fix pegs in the ground about 4 inches high, and at the distance of four feet from each other. To these, I attach a worsted thread from peg to peg, crossing them at intervals, something like what children call "scratch cradles." This effectually

are dissipated. The forming of a compost such scares the birds, as I have not lost a pea since I first adopted the plan. Seeds may be protected in the same way.

"When the birds attempt to perch on the strings vegetable substances have a tendency to promote they are overthrown, and so frightened that they never attempt it again; the worsted too, being of a clinging nature, their claws are sometimes en-

TO THE PUBLIC.

We, the undersigned, witnessed several times the last season, in the garden of the inventor, the utility and advantage of Nathan Breed's new invented Tree Preserver; and we are fully of the opinion it will answer every purpose intended, and serve as a complete guard against the depredations of the grub or canker worm; which has for years past, and still continues to make great havoc in our gardens and orchards. We cheerfully recommend it to the public as being one among the simple, yet not less useful inventions.

John Pratt-James Breed-Daniel Breed-John F. Hilton-James Pratt-Samuel Carleton-James

Lynn, Oct. 23, 1828.

The above Tree Preserver is for sale at the Agricultural Warehouse, No. 52 North Market street, Boston.

Lrrata .- In the Report of the Committee on Agricultural Experiments, last line, for Bristol read Brighton. The valuable Stock mentioned on page 102, belonged to J. Easterbrook Esq. of Royalston, not the Rev. Mr Easterbrook of Athol.

Gardener manted

A young Gardener (an unmarried man) who has a complete knowledge of his business, and can give unquestionable references as to his habits and qualifications, is wanted to take charge of a place about one hundred miles from this city. To such a person a fine opportunity now offers, as regards a pleasant situation and fair compensation. No others need apply. Call on J. B. Russell, New England Farmer Seed Store.

Situation wanted.

A Scotch Gardener, (with a family) who has a complete knowledge of his profession, and can produce recommendations

Fruit, Ornamental, Shrubbery Trees, and Plants, by Auction.

A large assortment of Peach, Apricot, Pear, Plum, and Apple, and Ornamental Trees, Shrubbery, Creepers, and Plants, will be sold at G. Channing's office, on Monday rext, at 11 o' clock, A. M. Catalogues on the morning of the sale. Oct \$1.

Irish White Pototocs.

One bushel only of the very superior Irish White Potatoes alloded to on page 114 of this day's paper,
Several varieties of Field Corn, selected with great care, for

its earliness and productive quality-also Early Sucet and the Early Jefferson Corn, for the table.

Just received at the New England Farmer Seed Store, No. 52 North Market Street-Eoston.

New England Printing Ink Manufactory. The undersigned has on hand from the above Establishment a constant supply of Printers' lak, warranted in no respect inferior to the best made in this country. Book, Roller, and News Ink in large or small quantities.—Also, Composition Rollers and Tables, of the most approved construction.—Terms reasonable. JOHN BAKER,

Curner of Congress and Water Streets, Opposite the Post Office. Oct. 21 61

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be pub In press at the New England Farmer office, and will be pulsished to-improve, the New England Farmer's Almanack for 1829. By Thomas G. Fessentian, Editor of the New England Farmer, For sale, wholesale and retail, at the N. F. Farmer office, No. 52 North Market street, by Bowles & Dearborn, 30 Washington street, and by the book-selbers and traders generally. Some copies interleaved with writing paper, Which will be very serviceable to farmers, will be kept for retail at the Farmer office.

Fruit Trees.

WM PRINCE, the Proprietor of the Linnsean Botaune Garden and Nurserines at Flushing. Long Island, as the pleasure Garden and Nurserines at Flushing. Long Island, as the pleasure of information the politics, that his Nursery now contains 172 varieties of the Apple. 22 do. of the pear, 75 of the pear, 75 of the pear, 75 of the pear, 75 of the pear, 75 of the pear, 75 of the of Cherries, 139 do. of Flories, 10 do. of Almonds, 14 do. of Malberries, 6 do. of Quirees, 16 do. of Almonds, 14 do. of Malberries, 50 do. of Quirees, 16 do. of Cherries, 139 of the Cherries, 130 of Cherries, 13 of Ornanental Trees, &c., Above hive bundled of the above kinds of Fruits are not to be found in any other collection in A-nerica. The different varieties canno ib otherwise than geni-ine, as the greatst attention is paid, and hearly all the kinds are inoculated from bearing trees. The Chenry, Peach, and other Trees, are generally of a large size. Catalogues may be obtained of J.R. Newell, at the Agricultural Warehouse, No. 57 North March 2015. 52North Market-street, gratis; and orders left there, or sent by mail, will meet prompt attention. Oct. 32.

Wilson's Nursery, Derry, N. H.

The proprietors form the public that their norsery offers peculiar facility for the acquirement of useful fruit; more than fright thousand trees one cultivated by them courseting of a great variety of Apples. Peacles, Ploms, Chernes, Quinces, &c. embracing most of the celebrated and esteemed kinds in this country. The uturnst care has been observed by the original proprietor for more than thirty years, u making the selection and the whole is now olivered as containing none but the one-worth-order outlinesting. Persons not consulted with the offer of the property of th of cultivation. Persons not acquainted with the different kindsby name, who wish to procure choice kinds, by stating the time they wish them to ripen, may confidently trust to the proprietors without fear of disappointment. All orders will be promptly at-tended to, and trees fornished at their norsery, this fall or next spring, at the following prices

SUBSCRIPTION.

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonse Leubat, having considerably enlarged his Vine-Mr Alphonse Leouat, having consideranty emarged in single appared, in Long Island, where he mus has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Routs Jahaving also the peculiar advantage of being enabled to procure the best specimens of routs from his father's extensive tineyards and nusseries, in the districts of Bordelais, Clerae, and Buzet, departments of Gironde and Lot and Garonne, in France (45° N. Lat.) proposes to the mmercus friends to the cultivation of the grape vine in the Lioned States, a subscrip-

tion will be opened on the first of August, 1828.

Mr A. L. will engage to furnish subscribers with the Grape
Vinc Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The rosts will be three years old, and will produce considerable from the second year from the time of their being planted. They will be carefully classed and packed in boxes, will some of the original self in which they have been ratsed, which will greatly actitate the thriving of the roets, when transplanted.

Orders will be panetoally attended to: the subscribers designed.

using the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1600 roots or more, at the rate of 12 1-2 cents for each root; for less than 1600, at the rate of 15 cents; and 25 cents per root for less than 50,— Roots only two years of I, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than one 1 ; and 13 cents for less than 50 roots.—Payment to be made on delivery of the roots .- Letters not received unless post paid.

ery of the roots.—Letters not received unless pest paid.
Subscription lists are open at New York, with Alphonas Louba, 33 Wall street—Boston, E. Copeland, Jr.—Albany, R.
Wilchael—Philadelphia, Van Anninge Baltimere, Willadelphia, Van Anninge Baltimere, Willadelphia, Van Anninge Baltimere, Willadelphia, Van Allen & Co.—Savannah, Hall Shapter & Tupper—New Orleans, Foster & Hotton Charleston, (S. C.), J. & J. Street & Co. Mr A. Loubat's bock on the Culture of the Grape Vine, and as the Alsir of William with the found at the originist back. and on the Making of Wine, may be found at the principal book-seliers of the United States; and his agents will turnish them gratis to subscribers.

Sausage Machine.

Orders for the Sausage Filling Machine. (post-paid.) sent to the Agricultural Establishment, No. 52 North Market Street, Boston, or to the subscriber, will receive prompt attention.

Dorchester Oct. 23.

JOHN MEARS

Tr One of the machines is left at the Agricultural Warehouse for examination .

MISCELLANIES.

The following lines to a ROBIN, that flew in at the window of Mr GRAHAME, will be read with no regretted loss of time.

" From snowy Plains, and icy Sprays, From moonless Nights, and sunless days, Welcome, poor Bird! I'll cherish thee; I love thee, for thou trustest me. Thou aced'st unt dread a Captive's doom; No! freely flutter round my room; Perch on my Lute's remaining string, And sweetly of the SUMMER sing. That note, that SUMMER note, I know; It wakes at once and soothes my wo, I see the woods, I see the stream, I see-ab still prolong the dream; Still with thy song, those scenes renew, The' through my tears, they reach my view. Thus heedless of the raging blast, Thou'lt dwell with me till WINTER's past; And when the Primrose tells, 'tis Spring. And when the Thrush begins to sing, Sonn as I hear the woodland song, I'll set thee free, to join the throng !"

We copy the following from the last number of the English Gardener's Magazine. Mr Loudon, the Editor, remarks, " a little care would have made this story of the progress of Mr Thor. burn's taste for plants, as good in its way as the Pilgrim's Progress, but we have printed it word for word as we received it."

Messrs. Thorburn, New York .- MR EDITOR, In your Magazine (Vol. ii. p. 345.) I observe a notice of the seed establishment of Messrs Thorburn of this city. I have often heard Mr Thorburn relate the following interesting aneedotes of his life, and as you may rely on them as facts, I doubt not but they will amuse many of your readers :- Mr Thorburn is a native of Dalkeith, near Edinburgh, and was by trade a nail-maker. In 1793 he belonged to the societies of parliamentary reform, known by the name of Friends of the People, and was a prisoner on that account at the time Muir, Palmer, and others were tried and banished. He got out of jail by the influence of friends, and landed in New York in 1794, being then in his 20th year. He followed nail-making six years in New York, when the introduction of cut-nails, [nails cut out of sheet iron by machinery] deprived lum of employment. He then took to keeping a small retail grocery store; but as this did not fully occupy his time (for even now he works among his seeds and plants almost night and day,) he got a quantity of common flower-pots, and painted them with green varnish color, the sale of which exceeded his expectation. In the spring of 1801 he observed a man selling plants, the first he had ever seen for sale in the market .- Carelessly passing the stand, he broke a small leaf, and it smelling agreeably, he enquired the name of the plant from which he broke it, and was told that it was the Rose geranium. Mr Thorburn says until that moment he never knew there was such a plant in the world as a gcranium. Taking another observation he thought the plant would look well in one of his green flower-pots, to stand on the counter, to draw attention (not for the purpose of sale.) However, next day some one fancied the plant and pot, which were sold at a shilling advance. He next purchased two plants, and disposed of them also; soon after he had twenty or thirty, and, erecting a small stage in his shop, opposite the door, he carried on a regular trade of plant-selling. This being something novel in New York, it drew attention. Strangers, when going the rounds of curiosity, stepped in to sec the plants: some wished to buy, but could not in the heart of the city.) The ground behind the

rior, and would buy the seed if it could be had; and was formerly the burying ground of the Meetseeds; but as no one made a business of selling sceds in New York in those days, he could not find any to commence with. He related his plans and difficulties to the gardener from whom he sold off, a passenger in a ship from London called, and offered to sell Mr Thorburn a small invoice of seeds which he had brought out. On opening the cask, he found a catalogue having the time of sowing on the margin. This, Mr Thorburn observes, was a prize to him, as it gave him the time of sowing, and also a model from which to print one for himself. After surmounting many difficulties, the seed store is now located in a building 60 ft. by 40 ft., late a meeting-house of the Society of Friends, in the very centre of business. Perhaps there is no where to be found a building so well adapted, and a seed-shop so well filled up with every thing necessary for the garden and farm, as in this establishment. Seeds, tools, pots, glasses, roots, and a library of the latest English, French and American works on hotany, gardening, &c. are kept for sale, and also for the inspection of the public (gratis). The seed drawers behind the counters run the whole length of the shop. Suspended above the drawers, in handsome glazed gilt frames, is a complete set of Curtis's Atlas, folio-sized, splendid and beautifully coloured plates of camellias, prize carnations, pinks, auriculas, ranunculuses, dahlias, &c.

The large high windows are shaded with landscape cloth blinds, and the walls above the shelves and drawers are ornamented with elegant scenery from the Alps of Switzerland, done on French hanging paper. As you enter into the front doors, it has the most imposing appearance of any thing of the kind I ever saw, either in America or Europe. In front of the shop, to the height of the bottom of the second story windows, is a green-house, 85 ft. long, and 18 ft. wide .-Through this you pass into the shop. This green house is built on the most approved plan, and contains now about 3000 plants. Between the greenhouse and the street is a bed about 80 ft. by 25ft. which, in the season, is filled with the handsome Dutch hyacinths, tulips, &c. The whole is cnclosed with a neat iron railing and two gates, where passengers are invited to walk in and look around, and only required to shut the gate behind them. It is a fact, which I have heard the Messrs, Thorburn often mention, and which says much for the good conduct of the inhabitants, and the taste they begin to have for these beautiful works of nature, that neither by night nor day have they known any of the flowers or fruits on their premises to be taken away or in any way injured, although the oranges and lemons hang within 4ft. of the railing fronting the streets, and may be easily reached with a hook or scape-net. The railing is only 41 ft. high, and they keep neither man nor dog to watch by night. Their whole establishment occupies 83 ft. by 90 ft. (Observe, it is

convey the plants 200 or 500 miles into the inte- shop is appropriated to hot-beds and plant-nits others, again, would ask for cabbage or radish ing, but has been very little used for that purpose for twenty years past. The Friends wishing it to be occupied as it is, sold it for a moderate price to Messrs. Thorburns, 20,000 dollars I have heard. Before giving possession, the whole ground was bought all bis plants, who informed him that he trenched to the depth of 7 ft., and all the bones rewas now saving seeds with the intention of selling moved to a neat cemetery prepared for the purin the market the following spring; but if Mr pose out of town. As the spot I have been des-Thorburn would take his seeds and plants, he cribing, and the owners, are known to some of would keep at home and raise plants and seeds your readers, I have no doubt but they will be for Mr Thorburn to sell. A bargain was struck, glad to bear of them. Messrs. Thorburn & Son and he thus commenced with a stock of fifteen have done more to place gardening on a respectdollars' worth of seeds. Just as this stock was able footing, than any other two men in America. HORTULANUS.

New York, July 16. 1828.

Splendid Bulbous Roots, &c.

A forther supply of Hyacioths, Tulips, Narcissus, Gladiolus, Sanos Drops, Croens, Star of Bethlehen, Jonquilles, Ramunculus, Jris, Crown Imperials, Anemones, Croens, &c. from 12 to 62 ets. each. A very lew of the finest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at

The collection of LILIES is very splendid, comprising Scarine conecuon of Lilles is very spienda, comprising Scar-let Chelecdonian Lily 30 cents, Orange Pompone Lily 37 cents Chicase Leopard 25 cts. Orange Martagon 37 cts. Yellow Mar-tagon 37 cts. Double Violet Flamed 37 cts. Purple and White Spotted 57 cts. Right Scarlet Pompone 50 cts. Double White 37 cts. Large White Garden Lily 12 cents, Dwarf Chinese Red 37 cts. Large White Garden Lily 12 cents, Dwarf Chinese Red 37 (et. Large winte Garden Liny 12 cens, Lwan Chinese Ace Lily (Lilium concolor, new and very superb, one root only) \$1.50 TULIPS—splendid variegated, red, yellow, and mixed, 12 ets, each, \$1.00 per dozen. CROWN IMPERIALS—assorted, of the most splendid col-

ours, and showy flowers, large roots, 38 cts. each.

JONQUILLES—sweet sceoted, finest roots, 19 cts. each.

POLYANTHUS NARCISSUS—fragrant, white with yellow cups, and yellow with double white cups, extra sized roots,

DOUBLE NARCISSUS-fragrant, of all colors, 19 cts. each SPRING CROCUS—of all colours, 6 cts. each. 50 cts. per

The above roots are from the same house, from which we received our sopply last scason, and which gave such universal satisfaction; some of the double Hyacinths having produced balls I inch and 8-10ths in diameter.

Porchasers are requested to notice that the above roots are not purchased at auction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. Those sold at auction are generally the mere refuse of the most inferim collections, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalogues of any respectable house in Holland.

Also pots for blooming the Crocus, in the shape of Hedgehogs, Porcelain Dice-work Flower Baskets, (very beautiful) Beehives, Flower Pots, Half melons, Cones, &c.—a new article. Two roots only of Wilmot's Superb Strawberry

Just received at the

New England Farmer Seed Store, No. 52 North Market Street-Boston.

Orchard Grass Seed .- Flint Wheat, &c. A further supply of Orchard Grass Seed-growth of 1828. Two hundred pounds of Red Onno Seed.

A few bushels White Flint Fall Wheat, commonly called Canal Wheat,—Also, Gilman Spring Wheat.

Just received at the

New England Farmer Seed Store, No. 52 North Market Street-Boston.

Grape Vines.

The subscriber offers for sale Grape Vines of several varieties, the produce of his garden in Dorchester; among them are the the proce-following : Isahella

White Muscat Black Hamburg Sweetwater Black Cape Elba Muscatel

Early Oval
They are principally of one year's growth, planted under his direction and superintendance, are warranted genuine, and are in a healthful and vigorous state. Alexander's or Schuylkill

'The subscriber proposes to continue the cultivation of such varieties of the foreign and native vines as are suited to this climate and that will thrive in the open ground in town or country.

Application may he made to the subscriber, at his office, No. 71.2 Congress Street, or at the Garden, to Patrick Kennedy.

Boston, Oct. 3, 1823.

ZEBEDEE COOK, Jr.

Boston, Oct. 3, 1828. Published every Friday, at \$3 per annum, payable at the

end of the year—but those who pay within sixty days from the time of subcribing, are entitled to a deduction of fifty cents:

NEW ENGLAND FARMER.

Published by John B. Russell, at No. 52 North Market Street, (over the Agricultural Warehouse).—Thomas G. Fessenden, Editor.

VOL. VII.

BOSTON, FRIDAY, NOVEMBER 14, 1828.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

ON THE IMPROVED BREEDS OF CATTLE.

Ma FESSENDEN-Many of us have been disappointed, and some of us, who have sent cows from a distance, greatly to our inconvenience and loss, by the decided impotence of the imported bull Bolivar, owned by Col. Power, and kept by Mr Jaques of Charlestown. I have no skill in judging of stock of this kind; and it would require none to see that this noble animal in his appearance and external properties has never been surpassed nor equalled among us. Several competent judges have pronounced him the finest animal ever brought into the country.

It is matter of great regret, therefore, that be propagating his species. That the proprietor of has almost ruined it." this superior animal could have been aware or even suspicious of this deficiency, no person, who is acquainted with this intelligent, public-spirited and most liberal patron of every agricultural improvement, can for a moment believe. It is impossible; and my present object is to show that the result in this instance is not extraordinary in regard to such high bred animals; and to leave it to others to account for, or discuss this fact, which seems to be well known among distinguished

I will quote from some letters of the Rev. HEN-RY BERRY, one of the most eminent agriculturists in Great Britain, on the subject of the Improved Magazine.

In the No. for May 1827, quoting from MAR-SHALL, he says, " It is observable that the bulls of this improved breed are not unfrequently, even be of public utility. while youthful, deficient in vigour, the hired bulls being sometimes returned prematurely on this account." &c. &c. &c.

Then again in the same letter be observes-I must in this place quote Sir John Sebright; he observes, I have tried many experiments by breeding in and in upon dogs, fowls and pigeons; the dogs became from strong spaniels weak and dilegs, small in the body, and bad breeders." want of vigour in BAKEWELL's bulls, and in many high bred ones of the present day, I ascribe to the cause, which produced the same effects in the objects of Sir John Seeright's experiments. In rules themselves. the unimproved stocks of the country we hear of heifer that will not breed; but in the improved races these facts are of every day's occurrence; not only, be it remembered, among animals highly kept, but in such as have experienced no indulindeed what Sir John Sebright describes his fowls to have become, long in the legs, small in the body, and bad breeders.

al; and if so, it offers us a warning not to be disregarded. On this point as respects swine, I am enabled to speak positively. I have long possessed a valuable breed, producing frequently, and sufficient numbers in a litter, and also attaining a desirable size. By breeding in and in, I gradually lost size and number, till some sows produced only one, while others never evinced a desire for certainly extraordinary among us ;-yet still I am the male, and the few young ones I could obtain were soldom, or with difficulty, reared. Valuing highly the fattening properties and form of this breed I retained and still possess some of the sows, which I have crossed. The result is striking and strongly to the point. They continue to produce few at a litter; but this produce, which is from the cross, I rear without difficulty, and they bring as many pigs as ever I obtained when is incapable, at least in his present condition, of my breed was unaffected by the practice which

These observations and facts, Mr Editor, appear to me of great importance. I pretend to no practical skill or knowledge in the case; but I have always felt a particular interest in fine animals of every description, from even a glow worm or a butterfly to that most attractive of all the Creator's works, a beautiful woman, flushed with the bloom of youth and health, buoyant in innocence and cheerfulness, and with a countenance radiant with genius and intelligence.

Everything relating to the improvement of our domestic animals, is so connected with our agricultural improvement and prosperity, that I make to apology for this communication; persuaded Breeds of Cattle, published in the British Farmer's that if it should contribute to exact and intelligent experiments and observation; or call forth a discussion of the general subject, among those who ject but to make the most from the sale of her are experienced and competent, it cannot fail to Yours respectfully,

Nov. 7, 1828. A. Z.

ON PREMIUMS FOR STOCK.

MR FESSENDEN-In looking over the report of the Committee at the late Brighton Show on Cows and Heifers, some doubts have occurred to me as to the propriety of the course, which they have adopted in bestowing their premiums. I have enminutive lap dogs; the fowls became long in the tire respect for the impartiality and good judg-The ment of the gentlemen, who composed the Committee; and according to the rules which have always been followed, do not think they could have decided differently; but my difficulty is with the

The object of the premiums in this case, I unno bulls refusing to serve cows; and seldom a derstand, to be the improvement of our Live Stock. How this is to be effected by rewarding the man, who is by accident the owner of a fine animal, who has taken no pains in rearing her, and is under no obligations to raise her progeny, I gence whatever; and but too many of them are do not well see. The owner of the cow, who obtained the first premium, came by an accidental purchase into possession of her less than a year ago. She was then of full age, and the previous In the No. for August, 1827, he says, "But how owner selected her by chance from a drove of catshall we account for impotence in the male, and tle, without any knowledge of her good qualities, barrenness in the female, which so commonly arise There was nothing in her appearance to recomout of this system [breeding in and in] when such mend her, as the Committee allow that she had failures were totally unknown in the ancestors? no remarkable points whatever, and was a home-

Surely such affection must be strictly constitution- by animal. She it seems has given an extraordinary quantity of milk, averaging ten quarts a day for more than ten months; and of a superior quality, though I could not learn from the report, by what evidence this latter fact was established .-The Committee give no statement of any measurement of her cream or any amount of butter produced by her. The quantity of her milk was at a loss to know why the accidental owner of such an animal, let her be ever so distinguished. should be rewarded with a premium for the Improvement of Live Stock. How is that end to be promoted, if nothing more is requisite than that he should present the animal at the Show.

No. 17.

My opinion is, that such a premium should not be bestowed, excepting where the owner has shown either particular skill in the selection, or particular care in the raising of the animal ;and will give security to the Trustees that he will (extraordinary accidents excepted) raise one or more of her progeny. Suppose for example, in case of obtaining the first premium of thirty dollars, fifteen or twenty dollars should be paid at the time; a bond should be taken that the owner rear the next calf; and the balance of the premium should be paid to him, on his exhibiting such calf at least a year old, at the Brighton show. This, which I by no means suggest as the best mode, would certainly conduce much more to the objects of the premium than the course new pursued.

In the present instance, the last calf, which this cow produced was sold, I understand, to the butcher; and she has been sent the present season to an ordinary bull; as the owner has no ob-

I beg leave through your useful paper to suggest these considerations to the Trustees of the Society, to whose enlightened, disinterested, and patriotic services, no one bears a more grateful testimony than

Your obedient servant, Nov. 12, 1828.

A. Z.

REMEDY FOR CANKER WORMS.

Mr Fessengen-In reading some weeks since in the New England Farmer, a description of "an apparatus for protecting trees from the ravages of the canker worm," I was reminded of a plan that I once formed, which is somewhat similar to the one invented by Mr Houghton.

If in your opinion it promises to be of utility. you will please to publish it in your valuable pa-

My plan is to place around the trunk of the tree a small quantity of earth, or what would be preferable, compost manure, upon which and around the tree is to be placed a square, wooden frame in which is cut a trough or channel, an inch in width to be filled with lime-water. The spaces between the frame and tree are to be filled with clay mortar. Nothing further is necessary than to keep the trough full, or perhaps to remove the grubs that might fall therein. In my opinion the final expense would be less than that of tarring, as the frame can remain, if necessary, several

their dimensions, for the growth of the tree. The joints of the frames can be filled with tar to renaler them water tight.

Westboro' Nov. 6, 1828.

MR FESSENDEN-Having broken the spear of my pump, about 4 feet from the brake, the upper bex fell so that it rested on the bow of the lower; consequently the top of the spear which is of $\frac{5}{8}$ square iron, was 4 feet under water. Quere .-How could the box and rod be extracted by any process short of hoisting out the pump?

A SUBSCRIBER.

SOLUTION.

The mode adopted was as follows-I took a dry Spruce pole, secured the end by a ferrule, bered a hole of sufficient size to admit the end of the spear, put it down on the end of the spear, held fast the pole in my hand, driving it as in the act of inserting an axe or hammer handle to prevent the box from being injured by the bow of the lower boxlet it remain in the water a few minutes to swell, then draw the whole gently forth.

MERRIMACK AGRICULTURAL SOCIETY. On the 15th and 16th of October, the 5th An- \$12.

nual Cattle Show and Exhibition of Household and Domestic Manufactures, for Merrimack county, N. H. was held at Loudon village. The exhihibition was well attended, notwithstanding the roughness of the weather. The exhibition of demestic manufactures, though not so large as on some former eccasions, was highly respectable;and indicated an evident improvement in many branches of household industry. The specimens of carpeting were numerous and handsome. Some of the pieces would not suffer in comparison with the best imported Kidderminster. The specimens of various other articles of manufacture were of good fabric, and worthy of commendation. Elegant samples of needle work, handsome counterpanes, one in particular very superb; two finely wrought bonnets, fabricated of the common spear grass, excelling in beauty many of the finest Leghorns. Specimens of native silk, excellent garden vegetables, a Carolina or sweet potate, which with several others were raised by Gen. Isaac East- N. E. Farmer, man, of Concord, a cotton plant by Mr. William Francis, of the same place, and fine samples of old Steers, 2 butter and cheese were among the products exhibited.

The neat stock was very much commended. Among the animals presented for inspection but not for premium, was a large ox, owned by Colonel Stery and Mr. Stinsen, of Dunbarton, of the same breed with the great Greenland ox lately exhibited at the south, and now in Beston for exhibition. This ox, or stag, is now five years old; a well built and good proportioned animal-his weight is not known, but his girth is more than eight feet, and his length nearly twelve.

The public exercises were, "a very apprepriate prayer from the Rev. Mr. Arnold, an address by PHILIP CARRIGAIN, Esq. of Epsoin." Of Colonel Carrigain's address, it is perhaps sufficient to say that it is characterized by the exuberance of fancy, flow of humer, and clegance of diction which have so long distinguished its accomplished auther. But to do justice to it we should say more than this-we should say that it embraced, among other good things, a good portion of valuable information, and conveyed much useful, practical Saxon or Merino Ewes, 3

years, provided a sufficient allowance is made in instruction. The Society dined at Capt. Emory's hall. A few choice sentiments, together with a song written for the occasion by a member of the Society, and sung with spirit and effect, by Major John D. Abbot, closed the repast.

The ploughing match, which was well conducted, occupied a part of Thursday, and the reading and attending to the reports of the various Committees and an instructive dissertation from Dr. Ebenezer Lerned, of Ilopkinton, closed the interesting exercises .- Abridged from N. H. Statesman.

The following Gentlemen were elected Officers of the Merrimack Agricultural Society for the year ensu-

William A. Kent, of Concord, President. Jeshua Darling, Henniker, Vice-President. Thomas D. Merrill, Epsom, Treasurer.

John West, Concord, Secretary.

Richard H. Ayer, of Hooksett-Caleb Merrill, of Pittsfield-Joshua Fifield, of Salisbury-James Cochran, of Northfield-Levi Bartlett, of Warner -Isaac Gerrish of Boscawen—Directors.

The following is the list of Premiums awarded: Enoch Gerrish, Boscawen, for the best farm,

Wm. Little, Hopkinten, the next best do. 10 Benj Wheeler, Concord, the next best do. 8 Laban Merrill, Canterbury, the next best do. 6 Amos Cogswell, Canterbury, the next best, 4 Page Eaten, Henniker, the best Kitchen Gar-

John Proctor, Henniker, for his Crops, 4 Sam'l A. Kimball, Concord, for the best field

Sam'l French, Loudon, the best pair Working

Oxen, 4 John Kimball, Canterbury, the next best do 1

vol. N. E. Farmer, Olney Thompson, Pittsfield, the best pair 3 year old Steers, 3

Jehn Curry, Northfield, the next best de. 1 vol.

N. E. Farmer. Simen Green, Pittsfield, the best bull, 4

Warren Story, Dumbarten, the next best do 3 Charles Glidden, Northfield, the next best do.

Laban Morrill, Canterbury, the best two year

Enos Hoit, Northfield, the best bull Calf, I vol. N. E. Farmer.

Robt. Ambrose, Concord, the best Milch Cow, 4 David Morrill, Canterbury, the next best do, 3 Enes Hoit, Northfield, the next best do I vol. N. E. Farmer.

David Morrill, Canterbury, the best three year old Heifer, 2

David Morrill, Canterbury, the next best do 1

vol. N. E. Farmer. Joshua Lane, Chichester, the best two years old

Heifer, 2 Daniel K. Foster, do. the next hest do, 1 Richard Greenough, Canterbury, the 4 best

earlings, 1 vol. N. E. Farmer.

Charles Moody, Loudon, the best Stud Horse 5 Stephen Cate, Loudon, the best Mare and Colt, 4 Stephen Perkins, Chichester, the next best do 1 vol. N. E. Farmer.

Richard Greenough, Canterbury, the best Saxon or Meriue Buck, 4

Richard Greenough, Canterbury, the 5 best

Joseph Baker, Loudon, the best Boar, 3 Isaac Virgin, Concord, the best sow, 1 vol. N. E. Farmer.

Jeremiah Emery, Concerd, the two best Spring Pigs, 2

Joab Patterson, Hopkinton, the best piece Fulled Cloth, 3 Amos Putney, Warner, the next best do 1 vol.

N. E. Farmer.

Joah Patterson, Hopkinton, the next best do, 1 Joshua Darling, Heniker, the best piece Cassi-

William L. Woods, do. the next best-do 1 Vel. N. E. Farmer.

Jeab Pattersen, Hopkinten, the best specimen dressed Fulled Cloth, 1 Vol. N. E. Farmer.

Joab Patterson, do the next best de. 1 Mrs. Richard Bradley, Concord, the best piece

Carpeting, 3 Miss Mehitable Tucker, Hopkinton, the next

best do. 2 Charles Stinson, Dumbarton, the best Cotton & Weolen Ceverlet, 1

Abigail Davis Canterbury, the next best do .-50 cts.

Miss Comfert Moore, Loudon, the best Counterpane. 3

Benjamin F. Neil, Loudon, the next best do.

Joab Patterson, Hopkinton, the best piece of Flannel, 3 Benjamin F. Neil, Louden, the best pair of

blankets, I Mrs. Abigail Davis, Canterbury, the next best

pair of blankets, 1 Asenath Mason, Loudon, the next best do. 1

Mrs. Nancy Dudley, Pembroke, the best Grass er Straw bennet, 2

Miss Mary B. Martin, Loudon, the next best

Susan Chadwick, Boscawen, the best woolen hose, 2 pair, 1

Mrs. Page Eaton, Henniker, the next best de. 50 cts.

Charles Stinson, Dumbarton, the best piece lin-

Jehn Townsend, Salisbury, the next best do. 1 Charles Stinson, Dumbarton, the best piece ta-

ble linen, 2 Mehitable Foster, Canterbury, the next best

do. 1 Charles Glidden, Northfield, the best specimen of Cheese, 1 Vol. N. E. Farmer

Enech Gerrish, Boscawen, the next best do. 1 Charles Glidden, Northfield, the best specimen

ef butter, 1 Vol. N. E. Farmer. Cyrus Tucker, Louden, the next best do. I

Ruel Walker, Loudon, the best manufactured leather, 1 Vol. N. E. Farmer.

Same, the best calf skins, 1 Isaac Eastman, Concord, the best breaking up plough, 1 Vol. N. E. Farmer.

Same, the best seed plough, 1

Same, the hest ox yoke, 1 Same, improvement in plough, 2

Same, the best specimen of Blacksmith work, 1

Vol. N. E. Farmer.

" Same, the next best de. 1

Dr. Ebenezer Lernerd, Hopkinton, the dissertation on making compost manure, 1 Vol. N. E. Far-

Benj. F. Neil, London, the best hearth rug, 1 Miss Clarissa Brown, Epsom, Lace Veil, 1

Miss Sarah Jane Stevens, Pembroke, Lace, 50 cts.

Mrs. Catharine H. Stevens, do. Lace Handkerchief. 50 cts.

Cena Tucker, Loudon, Lace Veil, 50 cts.

Benj. F. Neil, do. Cape Lace, 50 cts. Miss Mary E. Little, Hopkinton, Lace Handkerchief, 50 cts.

Same, Lace Collar, 50 cts.

Miss Sally M. Cady, Concord, Lace Cap, 50 cts. John L. Hall. Northfield the best ploughing, 4 Charles Glidden, do. next best do. 3 Shadrach Cate, Loudon, next best do. I

Scalds and Burns .- A Doctor Ward, of Manchester, corroborated by Mr Tatham, surgeon, of Kendal, has published cases in the Lancet of severe burns and scalds effectually cured by dredging the parts affected with fine wheaten flour .-This process is to be repeated as often as apparently requisite, and the flour allowed to remain on falls off as the skin has been restored. The relief from pain is, in every instauce, described as immediate. It is recommended generally to cover the flour with cloths, to exclude the air; and, lest ignorant people should slight so simple a remedy, Mr Tatham advises that the profession should send this specific to the afflicted "in a formal manner."

Extraordinary crop of Onions .- The extraordinary quantity of 141 bushels of Onions was gathered off 190 square yards of ground in the garden of Newburg this present autumn, being at the rate of 1000 bushels per acre. Taking each bushel to posed to every storm. Its growth is slow, and in one stone to each square yard, and rate at the enormous quantity of twenty-nine tons and an half 20 feet. During, however, the whole stage of its per acre. - York Herald (Eng.)

Cheap and valuable Manure.—Raise a platform red berries. of earth, eight feet wide, one foot high, and of any length according to the quantity wanted on the head-land of a field; on the first stratum of earth spread a thin stratum of lime fresh from the kiln, dissolve or slake this with salt brine or sea-water from the nose of a watering-pot, add immediately another layer of earth, then lime and brine as before, carrying it to any convenient height. In a week it should be turned over, carefully broken and mixed, so that the mass may be thoroughly incorporated. This compost has been used in Irelaud, has doubled the crops of potatoes and oats, &c. &c. and is said to be far superior to stable dung .- Bucks Gaz.

New Zealand Spinach (Tetragonia expansa) .-This most delightful vegetable which has only within a few years heen introduced among us, forms an important addition to our culinary herbs, and is remarkable for the luxuriance with which it grows in our climate. In the garden of Mr Wilson at Rose Hill, a single plant, the produce of one seed, covered, this summer, an area of 4 feet in extent, and abounded with large, tender, succulent leaves, affording one of the most delicate greens for the table of any of the spinaceous plants. It has the further advantage over other spinage of maintaining its succulence and verdure the

and as it readily produces seed, a few plants connection with their peculiar arrangement, render would be sufficient to stock a whole neighbour- it very beautiful and interesting. The appearance hood .- N. Y. Farmer.

BETULA, the Birch tree.

The trees of this genus most commonly known, are the birch and the alder. All the betula love a moist soil. The birch is applied to an infinity of uses. A wine is drawn (by tapping) from the trunk, by the natives of Canada; and in Europe wine is made from the fruit of the alder. The birch, though the worst of timber, is manufactured into vessels of various domestic uses. It makes capital charcoal. The inner silken bark, which the young branches is most singularly striped with peels off annually, was formerly used for writing on, before the invention of paper. In the northern climates the coarse bark is used instead of tiles or slates for the covering of honses. It is also used in certain processes of dyeing, and for tanning leather. In Kamtschatka they form the bark into hats and drinking cups. One great advantage in the birch, is, that it will grow where the patient, in the form of paste, till it gradually scarcely any thing else will thrive, and thus, almost barren land may be made to bring in a certain income of at least 20s. per acre. Broom makers are constant customers for the twigs, and hoop benders for the larger branches, and for the trunks, the turners and manufacturers of instruments of husbandry have a constant demand.

Extracts from Prince on Horticulture.

Ilex Opaca, or Common American Holly .- This is the most hardy of the native species, and is found growing in abundance on the sandy beaches of Long-Island, on the borders of the ocean, and ex-

Symphoria glomerata, or Indian Currant.-This forms a shrub of about five feet in height; the branches are numerous; the leaves are small, oval, and very profuse; the flowers are small and make no show, but are followed by red fruit at every joint and leaf, about the size of currants, which give it an interesting appearance, and remain on until late in winter. All three of the foregoing are of casy culture; they will thrive in almost any soil, and throw up numerous shoots.

Clematis vitalba, or Traveller's Joy. This, altho' a native of Europe, greatly resembles the Virginian Virgin's bower. Its growth, however, is far more strong and vigorous-its branches are very numerons, and will quickly overtop hedges, or any thing they can climb by. The leaves are pinnated, of a blueish green, and moderately large; the flowers are white, and are produced in clusters all over the plant in July and August. These are succeeded by seeds, each with a hairy plume, which remain on during winter, and it is from the appearance of these covering the tops of hedges, &c. in winter, and giving them an appearance calculated to amuse the traveller, that it has received the appellation of Traveller's Joy.

Pinus microcarpa, or Common American Spruce. This is called by many Hackmatack, and grows whole summer; and crops may be frequently naturally in low wet situations, where it forms a taken during the season from the same root. No tree often of 40 feet in height; it will succeed in kitchen garden ought to be without a supply of it; an upland soil, and its pale green foliage, taken in ware!

also of the small cones when young is worthy of notice, and adds much to its ornament at that period. In this particular there are three varieties, viz. those producing white cones, brown cones, and red cones. These variations, which are so striking during the growth of the cones, are not equally discernable at their maturity, as they then become dry and lose their color.

Striped Maple, or Acer striatum .- This is a tree of fine foliage, and medium stature; the bark of

Spiraa .- This genus comprises many shrubs of delicate and beautiful appearance, which are mostly natives of Siberia and North America, viz.

Spiraa hypericifolia, or Hypericum Leaved .- The leaves of this are very small, and the flowers are exceedingly delicate and beautiful: these are white, and produced in the greatest profusion along the branches, forming in many instances long wreaths. It attains to the height of about five feet.

Spiraa salicifolia, or Willow Leaved .- The flowers of this are also white, and are produced in panicles, more or less diffuse, and are much admired. This forms rather a taller shrub than the preceding, and its leaves are also of larger size.

Sorbus americana, or American Mountain Ash .-This somewhat resembles the Scotch Roan tree, (which has long been considered as one of the greatest ornaments of Highland scenery,) but its leaves are much larger, and of a paler green; the weigh four stones and an half, it will give nearly some instances it is said to attain to the height of berries which compose its clusters are also small-60 feet, or more; but its general size is from 15 to er, added to which, it loses its foliage much sooner, as autumn advances. The tree is also of less growth, it presents a fine appearance, the dark stature than the Scotch Roan, and in gardens, green foliage being finely contrasted by its bright seldom rising above twelve or fourteen feet, and forming a far less regular top than the foregoing. Its large clusters of bright red fruit are nevertheless beautiful, and although it is not equal to the European, it possesses claims to our attention.

> The Kalmia latifolia grows to the height of seven or eight feet, and sometimes higher. The wood is hard, compact, and is employed by turners and joiners, in making work requiring such wood. It also furnishes handles for scythes.

> Purifying water .- It is not so generally known as it ought to be, that powdered alum possesses the property of purifying water. A large table spoonful of pulverized alum, sprinkled into a hogshead of water, (the water stirred briskly round at the time) will, after the lapse of a few bours, by precipitating to the bottom the impure particles, so purify it, that it will be found to possess nearly all the freshness and clearness of fine spring water. Four gallons may be purified by a single tea-spoonful.

> Distressing accident .- A child of about four years of age belonging to Mr. Rosebury, of Greenwich, was a few days since, burned to death at the house of its father in law. We understand that the child was left alone in the house, and getting near the fire, its clothes caught, and before assistance came it was so dreadfully burnt that it expired the same night. Let parents and guardians be

FOR THE NEW ENGLAND FARMER.

CONTRIBUTIONS TO ENTOMOLOGY. BY THADDEUS WILLIAM HARRIS, M. D. No. IV.

Subgenus Anchomenus.

United to Callistus by Latreille, who informs us the thorax heart-shaped and truncated at base and piceous, punctured, with remote hairs. Feet pale upex. Leach says that the characteristics of this genus of Bonelli are, to have the third and fourth joints of the palpi equal, sub-acute; the basal tho- sylvanicus, Melsheimer; but differs from Mr. Say's rum transversely quadrate, entire, and the body somewhat depressed.

Our species exhibits the above characters, on which I must depend for the propriety of arranging it in the genus, no foreign types of which I have seen. Congeneric is FERONIA decora, Say, and probably also the species named by him, F. beneath, feet, and palpi piceous; antennæ fawncincticollis and decentis. The decora is about the colored. size of the following, has a rufous thorax and dark cupreous elvtra. They are found under stones in wet meadows.

purple, margined with green; beneath piceous; feet ochreous.

Length seven twentieths of an inch.

Head impunctured, and, with the thorax, æruginous green; lip and mandibles piccous, palpi and antennæ dark redish brown, basal joint of the lat- hind the middle, and rectangular at base, where ter ochreous. Thorax at base and dilated lateral it nearly equals the coleoptra in breadth; lateral indentations slightly punctured, dorsal furrow distinct. Scutel blackish purple. Elytra deep redish purple, external submargin green, with twelve or more ocellated punctures; striæ distinctly punc- tous appearance. Elytral striæ impunctured; intured at base interstitial lines very slightly convex, terstitial lines very convex, submarginal one serwith exceedingly minute punctures, the third line rato-punctate within. Feet piccous, tarsi paler with from five to seven large punctures, three of which nearest the base are contiguous to the third striæ, the fourth in the middle of the interstitial from being mistaken for ABAX coracinus, Say, to line, and the remaining ones contiguous to the which it appears to have some resemblance. The second stria. Body beneath glabrous, piceous; latter insect is known to me only by description. feet ochreous.

The punctures of the interstitial lines are so small as not to be discovered except by a powerful magnifier. It is probable that this insect is the FERONIA extensicollis of Say, with whose description it agrees in most respects, and therefore nelli. They are found under stones, but are rare. his name is adopted, until a comparison with an undoubted specimen of his insect shows mine to be distinct, in which case it may receive the specific appellation of proximus. Mr. Say describes the extensicollis as having impunctured strize, convex interstitial lines, rufous antennæ and palpi, and testaceous feet, in which it differs from our

GENUS CHLENIUS.

olivaceous, head impunctured, labrum truncate, body beneath fuscous feet pale ochreous.

Length nearly nine twentieths of an inch.

Body pubescent, the hairs decumbent, scricecus, ferruginous. Head bald, glabrous, impunctured. Palpi and three basal joints of the antennæ ochreous yellow, smooth; remaining joints fuscous, very hairy. Labrum and mandibles castaneous. Thorax above green, polished, punctured, with longer, more elevated hairs than on the elytra; broadest in the middle; longitudinal and done for six shillings and eight pence, and the dytransverse diameters subequal; lateral edges pur- er makes nearly the same, profit now as he did ple, regularly curved, slightly excurved at base; then,

disc distinctly canaliculate, basal lines tinged with disc purplish, submargin green, outer edge dark ferruginous; surface slightly polished, deeply and distinctly punctured; punctures of the striæ approximated, less distinct at tip; interstitial lines a England have a white and a blue rose near the that it is distinguished from Agonum by having little convex. Pectus, pestpectus and vent fusco-end. The white rose was designed to show that ochreous vellow.

Apparently approaches very near to c. Pennracic angles acute; and (in which it differs from description of that species in being pubescent, in to injure the texture of the goods, the dealers Callistus) in having the thorax glabrous, the lab- the paler color of the base of the antennæ and feet, and in the differently colored elytra, and truncate labrum, the punctures of the striæ, altholess distinct, are by no means obsolete at tip. Found under stones in wet places.

GENUS DICÆLUS.

p. *Leonardii. Redish black, polished; body.

Length half an inch.

Body glabrous, polished, impunctured, above deep piceous or redish black, beneath paler. Man-A. extensicollis. Head and thorax green, elytra dibles and labrum black, palpi piceous at base paler at tip. Three basal joints of the antennæ piceous glabrous, remaining ones covered with fawn-colored pubescence. Thorax quadrate, diameters equal, not contracted before; anterior angles simply rounded; somewhat contracted beedge not reflected; dorsal and lateral lines deep; anterior part of the disc with a small foveolus, each side of the dorsal line, and having a fortuiabove, and almost fawn-colored beneath.

The filiform antennæ will prevent this insect

This fine DICELUS was sent to me from Dublin. N. II. by the Rev. L. W. Leonard, whose kindness I am happy to acknowledge by the name. Two other species of the genus are found in this vicinity, namely, p. dilatatus, Say, and p. elongatus, Bo-

[From the New York Statesman.]

ON BLACK DYEING AS APPLIED TO WOOLEN CLOTH AND HATS.

The dyeing of black has detericated so much within the last forty years in England, and in this country as the copyist of England, that the colors would be considered as unwearable, were not the public taste has become so highly vitiated by the cloths as evanescent in their fabric as the colors c. *pubescens. Head and thorax green, clytra are fugitive. The faint miserable colors given to the blacks in the present day has been mainly the result of the prevailing passion for cheap goods .-To meet and indulge that ridiculous unprofitable passion, the manufacturer has been compelled gradually to make his goods in the most flunsy manner, and the dyer to make his color at as low a rate as possible. So much has the dyeing of black been lowered in the west of England, that a piece of twenty yards of broad cloth which forty years since was charged thirty shillings, is now

Before the year 1790, all the black cloths dved purple, elongated, and curving outwards towards in England, excepting the coarser grades, were the middle of the margin. Coleoptra olivaceous, colored blue in the woad vat previous to their receiving the black dye; and a considerable portion of nutgalls was used with logwood, &c. in finishing the color. All the black cloths brought from the cloth was white previously to its being dved blue; for, as cloths dyed other colors, if found defective, were usually dyed black to cover their imperfections, and as repeated colorings were found would not give the same price for cloths without the white rose. The blue rose was designed to show that it had received the blue dye, and the color of the rose was considered a criterion of the depth of the blue given. The white and blue roses are still preserved; but the blue is never put on, excepting by dipping a corner of the cloth in the blue vat, and by tying a rose on that part .-Nutgalls, which were found to give permanency to the colors, have also been exploded as too expensive; and the blacks now given to the public, are dyed with only logwood, fustic, and sumach. The latter being the only material in the composition that has any tendency to impart the least degree of permanency to the color, and that is necessarily used in such small portions, to preserve the blue bloom of the now fashionable colors, as to have but little effect in checking the fugitive dye of the

The French and the Germans have always made much better black, and given to that color a far greater degree of permanency than the English. I am aware that this opinion will be considered as high treason by English agents, through whose iufluence the most flimsy goods, and the most miserable colors, have become fashionable in this country, and the public taste in this particular, been materially vitiated. To prove the correctness of this opinion, I need only request any citizens, who have an opportunity of doing it, to compare an English black that has been worn three months with a Frenh black that has been worn the same time.

The color put on hats is even more fugitive than that put on the cloth; and it is high time that our dyers, both of woolen and hats, should pursue some mode of giving more permanency to their colors. The primary object of this essay is, to show them how this can be effected, without any additional expense to the operator. I am aware that it would be worse than useless to attempt to bring our dvers back to the old expensive but highly permanent process of giving a woad-blue to their goods before coloring them black: for the passion for cheap goods, that firmness of fabric, body, and permanency of color, and every other quality that give to them an intrinsic value, are now never taken into consideration. As giving a blue ground is out of the question, and as the nutgalls, the next most permanent mode, must also be resigned as too expensive, I have to direct the attention of our dyers to a material growing abundantly in this country, which answers even a better purpose than nutgalls, and will cost no more than the process now pursued.

Most persons living in the interior of the country know that the bark of the swamp maple will make good black ink, though they may not be aware that four pounds of this bark, dried and one pound of logwood for every pound of bark us-

Some few of our woolen dyers have, at my suggestion, used the maple bark for three or four years, and their colors are much esteemed both prove too blue they may be altered to any hue by the use of sumach or alder bark. W. P.

A VALUABLE DAIRY.

pounds of Cheese from the milk of only 28 cows; being on an average, 571 pounds to each cow .-York, one or two cents per pound more than that or papers, printed in the town of Salem." of ordinary dairies. Such a dairy, when cheese was at the price of 124 cents per pound, would make a man rich in a few years, and even at the present moderate prices, is no contemptible in-

PICKLE FOR BEEF AND PORK.

or pork is strongly recommended for the adoption by the authority of the same, That, from and after of those who pickle beef and pork for family use, the passing of this act, if any person shall enter Persons in the trade who will adopt it, will find a ready sale for their beef and pork. It has been used by many families in this city, and always approved. I do not hesitate to say that there is no pickle in use to be compared with it. It is familiarly known by the name of the Knickerbocker Pickle. Could this recipe be generally adopted, our pickled beef and pork would have certain preference in foreign markets.

RECIPE. - Six gallons water, 9 lbs. salt, coarse and fine mixed, 3 lbs. brown sugar, 3 ounces salt petre, I ounce pearl ash, I gallon molasses to damages to the party injured.

every 6 gallons of water.

the above proportions are to be observed. Boil and skim these ingredients well, and when cold shall take therefrom, without permission of the put it over the beef and pork .- N. Y. paper.

A LAUDABLE COMBINATION.

We have been favored with a copy of a small pamphlet, entitled, "Regulations of the Salem Association for the Detection and Prosecution of Trespassers on Gardens, Fields, and Orchards, in the town of Salem and vicinity." The preamble to the resolutions is as follows :-

Whereas the offence of robbing fruit trees, trespassing upon inclosed grounds, and wantonly inbecome so prevalent in this neighborhood, as to wealth, if duly enforced are sufficient to prevent any court of competent jurisdiction. and punish such offences:

present at this meeting, that we will form our- orehard, shall, without permission of the owner

The black obtained from this bark is equally as of property; and to this end, we promise to each bruise, cut, mutilate, injure or destroy, any fruit permanent as that from galls, and as the bark other mutual aid and facility towards detecting tree, tree for ornament or shade, or shrub, cultigives a much smaller portion of extraneous pre- and bringing to punishment, all future offenders vated thereon for ornament or use, and which cipitate, it will clean better, and make a much against the laws made for the protection of that shall be standing or growing thereon, such person brighter color. Those dyers who formerly used species of property, belonging to the subscribers, so offending, shall forfeit and pay to the use of nutgalls will know what quantity of swamp maple In order more effectually to give efficacy to the the Commonwealth, a sum not less than tea dolto use to a given quantity of logwood; but 1 objects of this association, we agree to adopt for lars, nor more than one hundred dollars, to be reshould suggest to more modern dyers to leave out our government, the following code of regulacovered by dictment or information, in manner as is provided in the second section of this act.

"By this code the Society is denominated "The Salem Association for the Detection and Prosecu- son shall commit any of the trespasses mentioned tion of Trespassers on Gardens, Fields, and Orch- in this act, on the Lord's day, or the night time, ards in the town of Salem and its vicinity." The that is to say, between the sun-setting and sunby dealers and consumers. Should the colors officers of the Society consist of a President, a rising, he shall be liable to double the penalties Vice-president, Secretary and Treasurer, and a and forfeitures, the same to be prosecuted for and board of three Directors. It is made the duty of recovered, in manner as before provided; and all the board of directors to "institute processes for all prosecutions for breaches of this act, shall be violations of the laws made in the premises, that commenced within one year from the time the We are informed that Mr Israel Cole, of this shall come to their knowledge by information of offences shall be committed, or the penalties and town, (North Adams) has made this season 16,000 members of the Society; they shall have power forfeitures shall have accrued, and not afterwards. to give suitable rewards for the detection of trespassers, and to employ such agents as may be We understand he increases the quantity of milk deemed by them proper for this purpose. They by giving his cows daily the whey mixed with may at their discretion publish the names of all meal. His cheese is of the best quality, and convicted offenders against the laws made for the fetches, with his established customers in New protection of gardens and orchards, in some paper

> The law on which the association is founded is as follows:

> An Act in addition to an Act, entitled "An Act for the more effectually preventing of trespassers in divers cases."

Sec. 1. Be it enacted, by the Scnate and House The following recipe for making pickle for beef of Representatives, in General Court assembled and upon any grass land, orchard, or garden, without permission of the owner thereof, with intent to cut, destroy, take, or convey away, any grass, hay; fruit, or vegetables, with the intent to injure or defrand such owner; each person so offending, shall pay, for every such offence, a sum not less than two dollars, nor more than ten dollars, to the use of the Commonwealth, to be recovered on complaint before any justice of the peace of the county in which the offence shall be committed; and the person so offending shall also be liable in

SEC. 2. Be it further enacted, That, from and In making a larger or smaller quantity of pickle, after the passing of this act, if any person, having entered upon any grass land, orchard, or garden, owner thereof, and with the intent to injure or defraud such owner, any grass, hav, fruit, vegetable, or shrub, cultivated thereon for ornament or use; such person so offending, shall forfeit and pay for each offence, to the use of the Commonwealth, a sum not less than five, nor more than fifty dellars, to be recovered by indictment, or information before the Circuit Court of Common Pleas, in the county where such offence shall be committed; or the Municipal Court of the town of Boston, if such offence be committed in the county of Sufjuring trees, planted for shade and ornament, has folk; and the person so offending shall be also liable to the party injured, in a sum equal to three form a serious obstacle to the cultivation of gar- times the value of such grass, hay, fruit, vegetable dens; and whereas, the laws of the Common- or shrub, to be recovered by action of the case in

round, are equal to one pound of the best galls. selves into a Society for the protection of this kind thereof, and with the intent to injure him, break.

Sec. 4. Be it further enacted, That if any per-

[Approved by the Governor, June 12, 1828.]

[Prepared by the Editor.]

BEES.

TROM THE NORTH AMERICAN REVIEW. (Continued from page 115.)

It is better to begin with a single hive, and so attain a knowledge of the habits and instincts of bees by degrees. We have known several persons, who have purchased a number of hives at once, and relinquished the pursuit from the perplexity that ensued when the swarming season commenced. But there is no similar occupation so easily followed, and none that requires so little capital, as that of keeping bees. The profit is enormous. If a person, well trained to the employmen; should follow the plan adopted in some parts of Europe, of removing the bees from place to place, in a kind of ark on a river of some length, thus providing a plentiful supply of food, he might increase his stock to any extent.

An apiary of twenty hives could maintain itself in an area of a mile, where there is plenty of blossoms. Every farmer should, however, provide pasture for his bees, as well as for his cows; and therefore when the spring and summer flowers are gone he should have a field of buck wheat ready, which, although not so palatable as other flowers, will serve the bees for winter food.

An apiary, or bec-shed, should be at the eaves, about four feet from the ground, with a roof sloping both ways, and with any aspect that the owner chooses. It should be ten feet wide, and the length of it should be increased as the hives multiply. It is, however, difficult to describe one accurately.

The most convenient one that we have seen is on a farm near New Bruaswick in New Jersey. It is fifty feet long, and contains sixteen hives on each side. The swarms which are successively cast off, are placed under the same shed in the winter, and an equal number of the old hives are sold to make room for them. This apiary might be enlarged to any extent, were there pasture enough for the bees; but the area of the bees' flight, as there are now many cultivators of bees in this district does not furnish food enough for a

In this apiary the miller or night moth is successfully guarded against. A small wire door, made to slide behind two door posts, formed of is done during the months of April, May and June; after that if the weather sets in warm, and the s let down, which, as it is fastened to the hive bestaples can easily be accomplished. Two rows of scantlings or joists four inches smare, and runhives between them, which are thus suspended at a distance of about three feet from the ground.

The hive is thirteen inches square at the top, and is of the same size at the bottom of the front and back, but the bottom of the sides is only seven inches wide. By this slope of the hive the combs wedge themselves as they are made, and there is no use for the ill-contrived crossed sticks, that are generally thrust in the old hives, to keep the combs from falling down by their own weight. The floor is, as we observed, fastened by hinges and hooks. It is likewise an inclined plain, having a slope of to be the easiest method of hiving swarms; as the the Agricultural Society of which Judge Peters at least four inches.

The advantage of this inclination will be instantly seen. The perspiration of the bees, which is copious, is, by the inclination of the sides and floor, conveyed off at once, without being absorbed by the boards. All extraneous matter can be carried away by the bees with very little trouble, and they can defend themselves from robbers or corsair bees with much greater ease than if the floor were flat.

As the floor opens and shuts, the observer can inspect the interior of the hive at pleasure, not with the hope of getting at the minutiæ of the lees' policy, but to see the forwardness of the combs, the number of the bees, and the general appearance, which a practised eye will soon understand. When the floor of the hive is left down all night, and the bees haug very low from the combs in the morning, they will soon remove themselves up again, if the floor is raised very gently and slowly and fastened as usual.

The cover of the hive is of course thirteen inches square. It is made of common pine, as is the hive, with two cletes on the upper part, as well to prevent the board from warping, as to prevent the box, or upper story, which is always added, from being moved from its place. The cover of the hive has three holes of an inch diameter, within a quarter of an inch of the other. These holes are to allow the bees to pass to the upper box, when the hive is full of hot. y.

It is ascertained satisfactorily, that the young brood and the bee-bread or pollen are deposited in the hive where the swarm is first put. The holes in the cover are therefore kept shut by plugs, nntil the hive be filled. The holes are then opened, the bees immediately pass up, and if the season be propitious, they fill the upper box with comb and honey, which, as there is neither brood nor bee-bread is of the finest and purest kind.

We have often seen forty and fifty pounds obtained by this simple proceeding; and the box is also used to feed a famished hive in the spring. A single comb, left in one of these boxes will sustain a swarm, that has eaten up all its honey, till vegetation commences. As the boxes and hives are of equal size, any box will fit a hive.

When the combs in the hive are three years for the use of the bees. Thirty weight of honey they begin to work. A clean cool hive, free from bushels of turnips.

soon as the bees have retired for the night. This of large size. The hives in question weigh, when to the bees; and the more closely the hive is joinempty about twelve pounds, a swarm of bees four ed together, the less labor will the insects have, pounds, the wax two pounds. The whole, there- whose first care it is to stop every erevice, that bees are oppressed by heat, the floor of the hive fore, ought to weigh about fifty pounds in Novem- light and air may be excluded. We must not ber. All over this quantity can be taken out to omit to reprehend as utterly useless, the vile prach ind with hinges, and on the side with hooks and advantage, as the wax becomes very dark after two or three years. The whole of the combs can and kettles, when the bees are swarming. It may be thus renewed in the course of four years, as have originated in some ancient superstition, or it ning the whole length of the apiary, receive the the bees replace them early in the spring. We may have been the signal to call aid from the omitted to mention that the length of the back of fields to assist in the hiving. If harmless, it is the hive is twenty-two inches, and the floor pro- unneccessary; and every thing that tends to enjects in front about three inches, thus forming an cumber the management of bees should be avoidapron or platform, on which the bees alight be- ed. fore they enter in at the little door. Models of this hive have been sent to several of the horticultural societies of Europe, and they are getting into use in this county.

When a swarm is to be hived, the hive is put in a moveable frame which is easily earried to the tree where the swarm hangs, and this is proved screws are taken out of the cover and the hive lifted up to the swarm in which they are shaken. The frame and hive are then placed on the ground, and the cover is gently laid on or screwed fast to the hive. Little sticks are put against the apron and rest on the ground, serving for ladders for those bees that fell to the ground when the main body was shaken into the hive. Bees from the moment of their leaving the hive (when swarming) until they are fairly settled and at work in a new habitation, seem stupid and confused. This arises, however, from the precarious situation of their queen. If she fall into the hive when the swarm is shaken in, all the remaining bees will soon find their way to the entrance; for a peculiar sound is emitted by these insects when their queen is present. If, however, she remain on the limb, it will be necessary to shake it again over the hive, as the bees will leave it to fly up to the place where the queen is. When the bees are quiet in the hive (which is ascertained by the number that are seen hovering in the front of the entrance on the wing, and by others ventilating the hive with their wings), the top can be covered with a sheet, doubled several times, to keep off the heat of the sun. The hive must remain in the same spot until eight or nine o'clock in the evening, whon two persons can quietly convey it, frame and all, to the apiary, and place the hive, with great care between the joists where it is permanently to remain.

Hives should be made and painted a year hefore they are used, as the smell of paint is disagreeable to the bees. The smoother the boxes and hives are, inside and out side, the better both for the health of the bees and for preventing the deposite of the eggs of the miller. We must except the roofs of the hive and of the box, as they should be rough; for we have ascertained, that the propolis, or bee-glue does not adhere so closely to a smooth surface at all times.

And here we would remark, that it has been the custom, from the earliest ages, to rub the inside of the hive with a handful of salt and clover, or some other grass or sweet scented herb, previously to the swarm's being put in the hive. We have seen no advantage in this; on the contrary, hundred and twenty-six bushels of corn; averagit gives a great deal of unnecessary labor to the ing sixty-one and a half bushels of shelled corn old, two of them can be taken out every winter, bees, as they will be compelled to remove every provided there remain honey enough in the rest particle of foreign matter from the hive before

needles is closed over the entrance of the hive, as is the average quantity that suffices for a swarm any peculiar smell or mustiness will be acceptable tice of making an astounding noise, with tin pans (To be continued.)

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 14, 1828.

Samuel Breck, Esq. of Philadelphia, has delivered an address in honor of Judge Peters, before was formerly president.

An establishment is in operation in Kentucky for water rotting and breaking hemp. The vat is one hundred by seventy feet, and rots a ton and a half of hemp in about seven days. The machine breaks 1200 a day.

AMERICAN LYCEUM.

A respectable meeting was held at the Exchange Coffee-house on the evening of the 7th inst. to take into consideration the subject of the American Lyceum. The meeting was organized, by choosing the Hon. Mr. Webster to the chair, and Mr. G. B. Enierson secretary. In answer to the call of Mr. Russell, editor of the Journal of Education, Mr. Holbrook gave an account of the establishment of branches of the Lyceum in several places, in this and some of the neighboring States; of the mode in which they had been conducted, and of the good effects, which had already been produced by them.

The Hon. Mr. EVERETT expressed the interest which he felt in the success of the institution. He stated some facts in relation to the good which was promised, and which had been effected by similar institutions in this country and elsewhere; and remarked particularly upon the facilities which would be afforded by the associations of the nature of the Lyceum, in procuring books and instruments, which individuals would not be able to procure for themselves. The chairman made a few observations on the benefits resulting from these associations. Several resolutions highly approving of their objects, were passed, and a committee, consisting of Messrs. Russell, Holbrook and Emerson, was appointed to report to the meeting at the adjournment, in what way the most effectual aid could be afforded to the interests of the Lyceum. The meeting adjourned, to meet again this evening at 7 o'clock, at the Exchange Coffeehouse; at which time the committee will report.

Good farming .- It is stated in the American Traveller, that J. L. Boylston, Esq., of Princeton, in this State, has raised this year, from three and a half acres and twenty-eight rods of ground, two per acre. And also on the same land, fifty cart loads of pumpkins, and a hundred and twenty

The London Agricultural Report for September, says, "The continental harvests have partaken generally of the defects of our own."

Canal Revenue .- It is stated in the Albany Daily Advertiser, that the amount of toll paid this year up to the first day of Nov. to the collector at Albany, is one hundred and forty-two thousand eight hundred and twenty-three dollars.

ERRATA .- In the third number of Dr Harris's article on Entomology, page I22, column 3, for Omascus read Omaseus. Page 123, column I, line 43, after downy insert a comma. Column 2, line 6, for universally read unusually. Line S, for *piceous read *piceus. Line 20, for lip read tip.

To Correspondents .- Several valuable communications are on hand, which will soon appear. Among others one from a correspondent in this city on CIDER-one from Connecticut on FOREST TREES-and one from Pennsylvania on a New INSECT IN FRUIT TREES.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c mustly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They rope, or for cuttivation here. Frice 2 octs. a paper. They were gathered by a gentleman familiarly acquainted with the soits, expressly for us. They will be sold by the single paper, or packed to order, in any quantity. A description of several of the trees will be found on page 131 of this week's New England Farmer. Among the assortment is the following :

Acer saccharinum Sugar Maple American Holly Hex opaca Convallaria Salomon's Seal Symphora glomerata Coraus sericea Indian Current Red Osier Tilia glabra Aralia audicaul·s Bass Wood Wild Sarsaparilla Yellow Birch Betula excelsa Acer spicatum Kalmia latifolia Mountain Maple Laurel Kalmia angustifolia Sheep Laurel Alder Alnus Clematis vitalba Traveller's Joy Mountain Ash Sorbus americana Taxus americana American Yew Meadow Sweet Spiraea salicifolia Fraximus americana White Ash Acer striatum Striped Maple Panax quinquefolium Azalea nudiflura Pinus macracarpa Ginseng Early Honeysiickle American Larch Spikenard Aralia racemosa Lilium superbus Aram triphyhum Superb Lily Wake Robin Pinus nigra Black Fir

Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and sav-ed with care expressly for us—For sale by the lb. or nunce.

Out Meal. &c.

Fine Oat meal and Oat Flour, Hulled Oats, Hulled Barley Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1823. Also, Lucerne, White Clover, Fowl Meadow, and every other kind of Grass cultivated in New England. Shallots for fall planting, Tree and Potato Onions.

Just received at the New England Farmer Seed Store,

No. 52 North Market Street, Boston.

Great sale of Wool.

ON THURSDAY, DECEMBER 18, AT 10 o'clock,
At the Hell over the New Market.

219 bales Saxooy WOOL, consisting of first and second Electoral—first and second Prima, Secunda, and Tertia.

246 bags Leonessa Soriana Segoviana Spanish Wool.

130 bags Pringuese Wool.

430 bags (about 76,000 pouds) American Pleece Wool, among
which are some choice lots of selected Saxony and full
blood Merinn Gleeces.

Catalogues will be ready for delivery and the Wool may be examined three days before the sale.

Coolidge, Poor & Head—Auctioneers.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity expressly for this Establishment, by certiful and experienced growers, and are warned pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Splendid Bulbous Roots, &c.

A further supply of Hyacintbs, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranuncu-lus, Iris, Crown Imperials. Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacintbs, dark and pale blue, pure white, rcd, yellow, and white with various eyes, at

blue, pure white, red, yellow, and wante was considered.

The collection of LHALES is very splendid, comprising Scarlet Chalcedonian Lily 50 cents, Orange Pompone Lily 57 cents. Chinese Leopard 25 cts. Orange Martagon 37 cts. Vellow Martagon 37 cts. Double Violet Flamed 37 cts. Purple and White Spotted 37 cts. Burget Scarlet Pompone 50 cts. Double White 37 cts. Large White Garden Lily 12 cents, Dwarf Chinese Red Lily (Lilium concolor, new and very superb, one root only) \$1.50 HYACHYIIS—(double and suigle,) dark blue, porcelain blue, red and rosy coloured, pure white, white with yellow eye white with rosy eye, and yellow with various eyes; from 25 cts to \$1.90 cach.

to \$1 00 each. TULIPS—splendid variegated, red, yellow, and mixed, 12

cts. each, \$1.00 per dozen.
CROWN IMPERIALS—assorted, of the most splendid col-

JONQUILLES—sweet scented, finest roots, 19 cts. each.
POLYANTHUS NARCISSUS fragrant, white with yellow cups, and yellow with double white cups, extra sized roots.

5 cts, each.
DOUBLE NARCISSUS fragrant, of all colors, 19 cts each
SPRING CROCUS of all colours, 6 cts. each. 50 cts. per

The above roots are from the same house, from which we received our supply last season, and which gave such universal satisfaction; some of the double Hyacinths having produced bells 1 inch and 8 ICths in diameter.

Purchasers are requested to notice that the above roots are not purchased at ouction, and are all remarkable for their size, and for the beauty and delicacy of tint of their flowers. sold at auction are generally the mere refuse of the most inferior collections, good roots being worth at home ten times as much as they generally sell for at auction, as will be seen by reference to the priced catalugues of any respectable house in Holland.

Also poss for blooming the Crocus, in the shape of Hedgehogs, Porcelain Dice-work Flower Baskets, (very beautiful) Beehives, Flower Pots, Half melons, Cones, &c.—a new article. A few more roots of Wilmot's Superb Strawberry.

Just received at the

New England Farmer Seed Store, No. 52 North Market Street-Boston.

Subscription for Vine stock for the finest table Grapes. A. Parmentier, at the Horticultural Garden, Brooklyn, corner of the Jamaica and Flathush road, two miles from New York having been urged by several lovers of the vine to propose setts of the best kind for sale by subscription, offers to the public setts of a dozen vines, with good roots of the most select and choice grapes for the table; many of which are quite new in this country, and all of which will ripen perfectly in any situation either in town or country.

Names of the twelve Sorts.

White Chasselas, with large fruit 2. Chasselas of Fontainbleau, near Paris

Yellow Chasselas of Thomery, near Paris

Golden Chasselas, the real genuine Musk Chasselas Chasselas, with very large black fruit

Red Chasselas White Muscat, or black Constantia Red Muscat

10. Black Muscat, or black Constantia

11. Black Orleans, bears very well the frest
12. Black Gamet, yields a second crop of blossoms and fruit when the first are frozen.

North and the control of the control

Nos. 11 and 12 are as fine for vinevards as for the table, the fruit is not so excellent as that of the preceding kinds, but is equally valuable on account of the certainty of a large crop aunually. The subcription receipt will be accompanied by directions on

the best mode of cultivation, planting and pruning the vine. The same sort of vines may be had separately, price One Dollar, except No. 4, Golden Chasselas, the gennine, which is Two Dollars. Communications for the above, and subcriptions

to his establishment post paid punctually attended to.
References, Dr. David Hosack, President of the Horticultural Society, Dr. Pascalis, President of the Linnæan Society, Dr. McNeven, Dr. Mitchell, Dr. Stevenson, and Hon. John Lewell.

Wanted,

On a farm in Roxbury a young man who has a knowledge of farming and can bring recommendations for industry &c. Apoly at this office.

3t. Nov. 7.

LINNÆAN BOTANIC GARDEN AND NURSEIHES, near New York, William Prince, Proprietor—The new Catalogues of this establishment are now in the press, and may soon be obtained from T. & J. Swords, New York, and of the other Agents. The collection of Pruit Trees base been nearly doubled sance the last edition, and comprises all the colociest varieties of every country. The associations of Ornamental Trees, Flowering Shrubs and Plants, Greenhouse Plants, &c. have also been greatly extended, and in fact every department has received the otimus attention both to their extension and improvement. The grounds occupied by the establishment have been extended to 10 acres, and the proprietor can now justly agate that orders for every description of Trees. can now justly state that orders for every description of Trees and Plants will for executed in a manner supernor to all former periods. The Cherries, Peaches and most other Trees are or large size—many of the Peaches, Apricols and Nectarines are on Plant stocks. The collection of Grapes consists of above on Figure 190685. The Conscious of Staphie Consists of Business of win be supper in quantiles at reduced rates, and 100,000 more are expected shortly from France and Germany. Without intending invidious comparisons, the proprietor appeals to those acquainted with his establishment as to tis decided superiority in every department. The whole management and supervision is attendeby himself and sons, and orders received from any disance acceive the same pointed attention as if the persons were on the spot to make their selections. The trees are packed in the best possible manner to ensure success, and with the greatest despatch, and are shipped to any place designated. And to those interested in Horticultural pursuits, he has only to say, that the same unreunited attention will be paid to the execution of its business, which has hitherto characterised the establishment. N. B. Plants of Wilmot's Superb Strawberry, and the celebrated Greville Rose can be supplied.

Roots of the Pie-Plant, or Tart Rhubarb.

A large supply of the roots of the Rheum Undulutum, or Tart Rhubarb, or Pie-Plant, an excellent article for summer use. (See N. E. Farmer, vol. vi. page 290, and page 11 of this vol-ume, and Fessenden's New American Gardener, article Rhubarb, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 cts per root.

MISCELLANIES.

HARVEST HYMN.

The following effusion was written for a recent agricultural exhibition at Hartford, Connecticut .-We are so much accustomed to associate the name of Mrs. Sigonrney with the poetry of our sister state, that we almost involuntarily attribute these lines to the fine fancy of that lady. To whomever they may belong, a certain warmth of feeling pervades them, which is one of the most apparent characteristics of Mrs. Sigourney's muse.

God of the year !-With songs of praise And hearts of love, we come to bless · Thy bonoteous hand, for thou hast shed Thy manna o'er our wilderness :-In early spring-time thou didst fling O'er Earth its robe of blossoming-And its sweet treasures, day by day, Rose quickening in thy blessed ray.

And now they whiten hill and vale, And hang from every vine and tree. Whose penciled branches hanging low, Seem bowed in thankfulness to thee,-The earth with all its purple isles, In answering to thy genial smiles, And gales of perfinne breathe along, And lift to thee their voiceless song.

God of the Seasons !- Thou hast blest The land with sunlight and with showers And plenty o'er its bosom smiles To crown the sweet Autumnal hours; Praise, praise to thee !- Our hearts expand To view these blessings of thy hand, And, on the incense-breath of Love, Go off to their bright home above.

Cattle Fairs before the Revolution .- Before the Revolution, regular Cattle Fairs were held in the town of Hardwick, under the patronage of Timothy Ruggles, one of the most distinguished men in our which overspread the land swept away the custom so beneficial to the agricultural community.— We notice that the euterprising inhabitants of Southbridge, propose to revive the ancient usage, and hold on Saturday, the 8th day of November, One of them, (though not the heaviest,) was upa Fair, for the exhibition, sale, and exchange of wards of a year old; the other four were of one cattle, borses and specimens of the mechanic arts. litter, and were less than eleven months old. The

in the spirit of improvement and of liberal compe- J.) Gazette. tition which has gone through the community.-

The experience of other countries, the best practical guide in our own, demonstrates that such open markets are eminently useful in their con-

business, they may doubtless be rendered advantageous to our citizens, allowing choice and competition in purchases, without the disturbance of those scenes of tumult and blood-shed which distince necessary, however, to be particularly careful grace the riotous and debased population of other not to let cattle run on mowing land while it is lands whenever assembled .- Nat. Ægis.

Theme for Thanksgiving Sermons-Some clergymen in this vicinity have suggested the propriety of delivering sermons on Thanksgiving day on the subject of general education-such as is contemplated by the establishment of Lyceums. We could mention the names of some distinguished ministers who have promised to make this subject the theme for their sermons on that day of gladness; we know of no subject more appropriate at this time, when efforts are making to elevate the standard of education in this country higher than it is in any other country on the globe .- Palladium.

Incredible barbarity .- Wood was formerly so scarce in Patagonia, and cattle so plentiful, that sheep were driven into the furnaces of limekilns to answer the purpose of fuel. We should not have dared to repeat this fact, however undoubted. if a decree of the king of Spain, prohibiting the barbarous custom, were not still preserved in the archives of Buenos Ayres .- Mem. of Gen. Miller.

The Minister of a country church having complained to one of his parishioners that he often saw his eyes shut during the sermon. "Aye, Measter Parson," said the humpkin, "thee doesn't think I hear wi'my eyes, do'ce."

Horticulture .- A correspondent obscrves that he has seen the nectarine this summer in great verdure, strong and flourishing, while the peach trees around it were decaying with the "yellows." He suggests as an experiment, the inoculation of the peach buds on the nectarine stock, leaving at the county in former times. The political commotions same time some of the nectarine shoots to grow with the peach .- N. Y. Statesman.

Fine pork .-- Mr. Smick, of this place, slaughtered five hogs, which weighed together 1,501 lbs. EL IN CARRIAGES IN COLD WEATHER.

The inconvenience and suffering, which arise channeal skill, and of good breeding, have not been trom cold feet, while riding in stages in the winoccasions where the farmer could part with his ter, are obviated in the north of France, by means surplus property, or supply his wants by sale or of pewter tanks, made after the manner of water exchange. The best premium on the productions plates, fitted to the bottom of the stages, and filled of skill and industry, is in the price they bring to the proprietor. Periodical sales have been atpart not only warmth to the feet in the coldest tempted by the New England Society, and it is weather, but a pleasant glow of heat through the said with a degree of success, although limited. Whole stage. chanical skill, and of good breeding, have not been from cold feet, while riding in stages in the win-

MOWING LAND.

It is a bad practice to feed your moving land very closely in the fall. There should be enough nexion with agriculture. Under judicious regula- grass left to protect the roots of the grass against tions and salutary provisions for the preservation the frosts of winter. We have known very good of order, and securing fairness in the conduct of farmers, who would not suffer their mowing land

to be pastured at any season of the year. But if the land be in good condition it can be but little injury to pasture it in the fore part of autumn. It wet, and so soft that they can make an impression with their feet.

TO PREVENT YOUNG FRUIT TREES FROM BEING DESTROYED BY MICE.

When the earth has been deeply covered with snow for a few weeks, we frequently find many trees in our nurseries and young orchards injured, or perhaps destroyed by mice. To prevent their excursions and lessen their number, it has been recommended to tread the snow down very firmly about the roots and bodies of the trees, to the distance of two or three feet from them. This will make the snow too solid a mass for them to penetrate, and probably destroy many of them in their nests. As these animals require warm nests to sleep in, all the materials with which they cover themselves, such as grass, weeds and stubble. should be removed from nurseries and young fruit trees. Particular attention is required for those trees, which are placed near to a wall, as it affords a secure and comfortable shelter for mice. No kind of manure which can harbor mice should be laid about your fruit trees.

SUBSCRIPTION.

For importing Grape Vine Roots from Fronce, at a moderate price, and encouraging the introduction of that culture into the United Stotes.

United States.

Mr Alphonse Loubat, having considerably enlarged his Vinevard, on Long 'Island, where he now has, in full cultivation,
thirty-five acres of ground, containing '12,000 Grape Vine
Roots; having also the peculiar advantage of being enabled to
procure the best specimens of roots from his father's extensive
ineyards and nurseries, in the districts of Bardelais, Clerae,
and Buzet, departments of Gironde and Lot and Garonne, in
France, (48° N. Lat.) proposes to the numerous friends to the
cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1628.

Mr A. L. will engage to furoish subscribers with the Grape
Vine Roots, before the first of March next, and forward then

Mr A. L. will engage to furoish subscribers with the Grape Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opened. The roots will be three years old, and will produce considerable fruit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, when transplanted.

Ord ers will be punctually attended to: the subscribers desir-

Ord ers will be punctually attended to: the subscribers desig-Ord ers will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. They will engage to pay for 1000 roots or more, at the rate of 12 1-2 cents for each root; for less than 1000, at the rate of 15 cents; and 25 cents per root for less than 50. Roots only town tys and 425 cents per root for less than 50. Roots only town tys great control for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than an or 1; and 80 cents for less than 50 roots. Payment to be made on deliv-

sellers of the United States; and his agents will furnish them gratis to subscribers.

New England Farmer's Almanack, for 1829.

In press at the New England Farmer office, and will be published to-morrow, the New England Farmer's Abuanack for 1829. By Thomas G. Fessenden, Editor of the New England Farmer. For sale, wholesale and retail, at the N. E. Farmer. Farmer. For sale, wholesale and retail, at the N. E. Farmer office, No. 52 North Market street, Soules & Dearborn, 50 Washington street, and by the booksellers and traders generally. Some copies interleaved with writing paper, which will be very serviceable to farmers, will be kept for retail at the Farmer office

BOSTON, FRIDAY, DECEMBER 19, 1828.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

ON THE INSECTS THAT INJURE THE APPLE TREE.

MR FESSENDEN-Pardon me for saying, that your exposition in the Farmer of the 5th, relative to the Coccus, or American blight, is not perfectly understood by myself, and I fear not by other of your readers. Your Pennsylvania correspondent asks information relative to an insect " about the size and shape of a small grain of coffee, found on the body of the apple tree. The plant lice described by Mr Peaker, are "in form like half a kernel of rye, but not more than a twentieth part as large, with the flat side sticking to the smooth bark of the tree." Do these gentlemen refer to the same insect? And is this the insect described in your quotation from Kirby & Spence? I think not.* I noted Mr PERLEY's communication with deep interest, on its publication in your first volume, as many of my young apple trees were then suffering from the lice he described, and some had been apparently killed by their depreda-They were abundant not only on the smooth bark on the exterior, but on that which had formed under the rough bark that had partially peeled from the trunk. I profited by Mr Penley's suggestions, and subsequently by these of Mr Wheelina, and applied strong lye with a brush, in June, with very great benefit, sometimes with, and at othertimes without, the addition of lime. I doubt not but strong brine would be equally fatal to the insect, but I was fearful it might become injurious to the trees, having lost

* We believe that our Pennsylvania correspondent, in his communication, published page 142 of the current vol. of N. E. Farmer, meant to describe two distinct kinds of insects, one of which we thought might be the same with that mentioned by Mr Perley.

MIT PERLEY.

Our Pennsylvania friend says (page 142) "the appearance [of the insect] to me resembled the blossoms of Timothy, or some small grass, slaken an the trunk of the tree, when wet with dew, and remaining on it. After which they increased in size to about the bigness of shot No. 8 cut in two, and a little lengtheued; and formed a corer adhering to the bark, under which the insect, whatever it may be, was found."

Again, in the same page, he speaks of the insect, (which may be the same, but we should suppose, from the description that it was of a different species) which was "dark coloured, on the body of the tree, about the size and shape of a small grain of coffee with a bristly coat," &ce. We can hardly suppose that conce with a briskin coat. 'e.e. We can hardly suppose that both these descriptions apply to the same insect, though from the manner in which the last mentioned is introduced by our correspondent, one would be led to suppose that he considered or respondent, one would be led to suppose that he considered them to be the same. We, therefore, give page 153 Mr PERLEY's description of lice on apple trees," and observed that "The above description of a dest netwer his extended the insect many not be the same with that which has annoyed the fruit trees of our correspondent." The appearance which "resembled the blassoms of Timothy" of "M." might be the "white animalcule, resembling a lone, as small they are hardly perceptible to the naked eye" of Mr PERLEY. But it seems impressible that the cover adhering to the bark under which the insect was found, "would have been the same with the "birsty coat," menuoued by "M." in nother part of his communication. But insects appearances so totally different in their changes from the egg to the larva, pupa and perfect state that none but a skillful entomologist can always detect them in their different disguises. It fortunately happens, however, that he same remdisguises. It fortunately happens, however, that the same remedies are efficacious against all or nearly all the species, and we have no doubt but either assolution of salt, as recommended we have no come but entire agreement or sait, as recommended by Mr Practery, a solution of potsh, as prescribed by Mr. WHEELER, or spirit of ter, as used by Sir Joseph Banks, would prove equally efficacious against most or all those insects which infest the bark, leaves, stems or fruit of fruit trees, whether they are or should be considered as belonging to the tribes of the Aphis, Coccus, Tinca, &c.—EDITOR N.E. FARMER.

PERLEY. The eggs, which cannot be distinguished bot with the assistance of a microscope, are deposited in a white cotton-like substance, in which the insect is enveloped, generally at the insertion of small branches, in the chinks of the there are suckers coming from that point .-Wherever the nursery lodgment is made, warts or protuberances ensue. They are small and induin bunches or large masses. I have seen like apand forests, but never gave them a particular exand is different from that described by Mr PEa-LEY. We have for two seasons followed the directions found in Loudon's Gardener's Magazine, in the Albany Nursery, for the destruction of this aphis, by applying oil to their nests, if I may so call the mouldy-like substance, in which they are usually enveloped. As these were often found in the incision where a bud had been inserted a few weeks before, we had apprehensions that the application would prove detrimental; but this was not the case. We succeeded, with considerable labor in nearly extirpating them from the stocks in our nursery. Most of the plant lice, I believe, belong to the genus Aphis. They are troublesome on the peach, cabbage, &c. and are endowed with singular properties of propagation, by which they multiply with incredible rapidity.

Before I close this communication, permit me to express my regret that your " New Correspondent" has not thought fit to give us either his name or the title of the "works" in which he has read "a minute description" of the diseases which now affect our pear and plum trees. "minute description," must advise us of the causes, as well as suggest the cures. The gentleman should not hide his light under a bushel; and I, for one, should feel particularly obliged if he would let it shine upon us. Venerating, like him, the writers of "some eighty or ninety years ago," I have carefully examined Philip Miller, as well as more modern works, but can find nothing in any of them like the diseases which we have under consideration. But let us not misapprehend ing about 7,6 to 1 in favor of the quince stocks. each other. I consider the disease of the apple

several trees by the corrosive effects of salt, which and pear, now pervading the country, different was contained in damaged fish applied to my or- and distinct from the fire blight of Europe-that it is confined to no soil-limited to no particular There is another insect which is seriously inju- varieties, and confined to no aspect. Your corrious to the apple tree, which seems particularly respondent says, this evil does not arise in light to be the dread of European nurserymen and or- sandy soils, not heavily manured. My soils are chardists. It is called, by Loudon, Salisbury, and precisely of this kind. It first appeared in them other horticultural writers, the Aphis Lanata, or in 1927, upon more than 100 trees, and upon American Blight, but for what reason this last term grounds which had received no manure for years. is applied to it, no one has satisfactorily explained. In terming these new diseases I have followed the Salisbury has figured it, in its different states, as example of others. I was first acquainted with it appears under a magnifying power, upon a them in 1822, at Kingston, and have marked their branch and root of an apple tree. It is decidedly progress northward and westward from that date. different from the plant louse described by Mr During the last season I have visited several districts where they are both yet unknown. I mentioned the Messian fly, as an instance of new insects coming among us. I might add the bee miller and the locust borer.

No. 22.

Your "New Correspondent," in suggesting the bark, or at the surface of the ground, especially if soils adapted to different fruits, assigns to the St. Germain pear, one that is rich. I beg leave to qualify this, by adding to rich, in the language of Miller, Loudon, Coxe and others, warm and dry .rated upon the stock, but upon the roots are often All cultivated fruits, I believe, like a rich soil: though the fruit of many varieties attain to higher pearances upon shrubs and plants in the fields perfection upon a soil that is warm and dry, or in other words upon sands, gravels, &c. Among amination,* This, I apprehend, is the Coccus, or these are the golden pippin, winesap and other American Blight, described by Kirby & Spence, apples, the St. Germain pear, and I think the peach. The juices are more concocted and higher flavored, on dry, light grounds, though the volume of pulp is less. Miller says, that in a moist situation the juice of the St. Germain pear is apt to be harsh and austere. The experience of my neighborno d shows it. Again-he says the Vergaieu requires a rich and the St Michael a gravelly soil. I believe the Vergalcu of our nurseries is the St Michael or Doyenne. The Vergaleu of Europe is advertised with us under the name of winter Vergaleu, Ice pear, or Poire de Glasse, or Chambrette. The first is in eating in September: the latter in November and December.

Albany Nursery, Dec. 7, 1828. J. BUEL.

QUINCE STOCKS FOR PEARS.

An article on this subject has lately been published in " Transactions of the London Horticultural Society," by Thomas Torbron, F. H. S. &c .-The writer observes that " working the best kinds of pears on quince stocks is an old, though not a generally enough adopted custom. The effects of such a union are universally known; but no one, perhaps, could have imagined that the difference in the fertility of quince and free stocks, could have been so much as is shown by Mr Torbron's comparison. In a careful estimate of produce, by measure and tale, as well as by space on the wall, be states that the Gansell's Bergamot. on the quince, yielded at the rate of 15.1 to 1: the Brown Beurré 4,4 to 1; the Crassane, 8,2 to 1; and the Colmar, 2,8 to 1; together averag-"Such a result deserves the attention of nurserymen and the owners of small gardens. It is to be *This insect is also described and figured by London, Gard, Mag, p. 702. The remedy he prescribes is "Thoroughly to cleaning with a brush and water, together with amputation when it has been some time at work." This he says is "the only means of destroying this insect; but even this will not do, only means of destroying this insect, but even this will not do, ould not a carry stage of the process."—Editron.

recovered their luxuriance and fruitfulness. this paper a note is prefixed by Alexander Seton, or cribs, and will bear cutting the oftenest. Esq. F. II. S. with a view to call the attention of persons to the same object, stating that he thinks pears grafted on quince stocks are better adapted for stiff clayey or loamy soils than those on free stocks, and recommending this choice to planters located on such soils."

There are, however, some disadvantages attending the use of quince stocks to engraft on .-The quince, we believe, is not naturally so long lived as the apple tree, its age, it is said, seldom exceeds ten or twelve years. The quince tree is they may be continued in milk till within a week quite as liable to be attacked by the worm called or two of calving without suffering any injury the borer as the apple tree.

(By the Editor.)

ON THE MANAGEMENT OF COWS KEPT FOR THE DAIRY.

Where butter is the chief object of a dairy, care should be taken to select such cows as afford the of the udder; which is a circumstance deserving best and largest quantities of milk and cream of of attention. Where only one or two cows are whatever breed they may be. But the quantity kept for the supply of a family, it is likewise useof butter to be made from a given number of ful to know that by good feeding they may be cows must always depend on a variety of contin- continued in milk without any bad consequences gent circumstances; such as the size and good till nearly the time of calving. In the Agricultuness of the beasts; the kind and quantity of food ral Survey of the West Riding of Yorkshire it is and the distance of time from calving. A large stated, that no advantage was found to result from cow, generally, will give more milk than one of allowing cows to go dry two months before calvsmaller size; though cows of equal size differ as ing. They have there been kept in milk within to the quantity of cream produced from the milk ten days of the time of dropping the calf. This of each; it is therefore, in those cows whose milk practice however, cannot be considered generis not only in large abundance, but which from a ally advisable." peculiar inherent richness yields a thick cream, that the butter dairyman is to place his chief dependence; and where a cow is deficient in either of these she should be parted with and her place supplied by one more proper for this use.

respect to cows should be the same.

It is essential that milk-cows be kept at all titnes in high health and good condition. If they has proved an effectual remedy." are allowed to fall off in flesh during winter, an abundant supply of milk need not be expected by bringing them into high condition in summer. Warm stables should be provided for them, as beasts will not require so much food when kept warm as when shivering with cold.

equally nourishing. It is esteemed the best of all it becomes useless, rather than to bury it in the able culture .- Ibid.

Mr Leudon says "The time cows should become dry before their calving is not agreed on, some contending that they may be milked almost to the time of their dropping their calf without injury; while others maintain that it is absolutely necessary that they should be laid dry from one to two months, both for the advantage of themselves, and of their calves. It is probable that much in this business depends on the manner in which they are kept; as where they are well fed whatever from it, but in the contrary circumstances it may be better to let them run dry for a month, six weeks or more according to their condition, in order to their more fully recruiting their strength. It appears not improbable that the longer the milking is continued, the more free the cows will be from indurations and other affections

In the last edition of Willich's Encyclopedia it is said that "inflamed teats should be washed with two drachms of sugar of lead in a quart of water. Should tumors appear, apply a common warm mash of bran with a little lard. And to Where cheese is the object, the management in prevent cows from sucking their own milk, we are informed that rubbing the teats frequently with the most fætid cheese that can be procured

From Marshall's Minutes of Agriculture.

MANURE AS APPLIED TO DIFFERENT SOILS.

During the drought of summer, clayey soils are divided by immmerable fissures; and if the ma-For about a month previous to the time of cows nure be laid on while the soil is in this state, the ealving, if in spring, they should be turned into first shower of rain carries down the dissoluble ticultural science of our country. Mr Prince is sweet grass; or, if it happen in the winter, they particles into the vegetative stratum. But, in win- the proprietor of one of the richest and most exought to be well fed with the best hay. The day ter, a retentive soil resembles a sponge filled with and night after they have calved, they should be water; and the manure laid on, while it remains kept in the house, and no cold, but luke-warm wa- in this state, must either be washed away by ter allowed for their drink. On the next day, heavy rains, or be lodged near the surface; and about noon, they may be turned out, yet regularly cannot possibly penetrate the soil until it be made taken in, during the night, for three or four suc- porous by the ensuing summer's drought. On the cessive days; after which they may be left to contrary, an absorbent soil is always open to superthemselves. Cows, thus housed, should be kept ficial moisture; it resembles a dry sponge, which in their stables till the cold is mitigated by the greedily absorbs the moisture it can reach; and morning sun, and it is recommended to give them as fast as the manure laid on such a soil is liquia draught of warm water previous to their being fied, it is received by the mould. The danger turned out. Without such precautions they are here, perhaps, lies in its being hurried through the liable to miscarry, or slip their calves; an acci- vegetative stratum. Is not winter then the fittest grape, which, although not of greater importance dent by which the calf is lost and the cow injur- time for feeding such a soil, when the current of ed. For some time before and after they have absorption is gentiest, rather than summer, when calved they should be kept separate from the its rapidity may hurry down the vegetative food, continue to be the subject of experiment with culyoung stock, whether in the yard, stable, or field, and prevent its being incorporated with the plant- tivators throughout the Union. We recommend English writers assert that Lucerne is most ex- feeding mould? And is it not obviously eligible, the work to every lover of ornamental gardening, cellent food for cows in milk; and preferable to on such a soil, to lay the manure on the surface, as useful in pointing out the choicest kinds of clover, as it gives the milk a better flavor and is at the greatest distance from that depth at which shrubs and trees which most easily admit of profit-

To grasses for cutting green and feeding out in racks soil, where it may more readily escape below the sphere of vegetation?

The writer is, at present, so fully satisfied with the former part, at least of this theory, that he is determined not to manure in future the surface of a retentive soil, when its pores are full; he will either embrace the opportunity when dry weather has rendered it absorbent, or bury the manure in the soil; in which situation it may meliorate, not only, perhaps, as a food, but also as a provocative.

FELLING TIMBER.

Different seasons of the year for felling timber that is designed for durability, are recommended by writers. Some say in May, while the sap is vigorously flowing; others in September, when the alburnum or white wood, is not so full of ascending sap, that contains saccharine matter, acids and mucilage, which ferment and produce the decomposition of the wood. The different and contradictory opinions arise in a great measure from partial experiments and too limited observation. There are many circumstances to be taken into consideration-the maturity of the tree, the nature of the soil, the difference in climate, the state of the season and many others. Facts have been produced of trees felled in May lasting twice as long as those in February, and also vice versa. All writers we believe agree that peeling the bark in May and letting the tree stand for several months greatly promotes durability. The proper time can only be ascertained by the accumulation of facts; and for this accumulation there is no better way than for every farmer to record the time of felling his trees, with as many other circumstances as possible. Were farmers generally in the habit of keeping a diary, much more rapid progress might be made in agricultural knowledge .- N. Y. Farmer.

PRINCE ON HORTICULTURE.

Mr Prince, who is so well known as a horticulturist, has published a short treatise on Horticulture, containing, as he says, " some of the leading rules whose adoption has proved most successful, and intended as an accompaniment to the catalogues and an aid to those who are ignorant of the subject." A work of this moderate pretension would not excite much expectation; it contains, however, a mass of useful information, and forms, in our opinion a valuable contribution to the hortensive garden establishments of this or any conntry; and no expense or labor has been spared to collect fruit and ornamental plants of every description; and no where has so large a number of American species been brought together.

The work before us is particularly valuable as containing the results of long experience in acclimating foreign plants, and in domesticating many of our indigenous fruits which will bereafter form most important additions to the luxuries of our gardens.

A large portion of the work is devoted to the as a national object of cultivation than the apple, still it is of the highest interest, and will, we hope,

FOR THE NEW ENGLAND FARMER.

NORTH DEVON STOCK.

Mr. Editor,-About four years ago a friend imported from England a very fine bull of the ahove breed; a gentleman well acquainted with its recalling it to my recollection, and caused me stock, having recommended it, believing from their moderate size and similarity to our native stock, they were better fitted to New England pastures; and also their well known activity as working cattle and respectability as milkers .-This animal, for two years, was kept in Sandwich, N. H. a town, for many years past, noted for a large and fine breed of cattle, to which they were much attached; and it is stated by one of their most noted breeders, who writes under the date of November 20th, 1828, "the Devon breed are much approved of, they do well to mix with our large Sandwich breed, we have no heifers yet in milk-no steers, as the males were all kept for bulls; our heifers are very fine and promise good cows; there are but few of the Devons now in Sandwich as they have been sold into different sections of the country. I sold my calves (which were all bulls last season) one for \$20, one for \$25, one for \$40, and one for \$50."

These prices are considered great, when compared with the usual prices of calves of the common breeds, probably not more than five dollars.

The North Devon is now in Westminster, Vt. where he is said to be in high repute; and will doubtless do much good in the improvement of their stock. After the next spring this very handsome and valuable animal will probably come A SUBSCRIBER. back to Massachusetts.

EXTRAORDINARY YIELD.

The River La Plate, or long red Potato, is noted for its fruitfulness. A gentleman of this town raised the present season from two bushels and a peck, fifty bushels.

The ground was broken up last year, planted with potatos and manured very liberally. The present year it was not manured at all. The potatos were cut into one or two pieces; one piece was planted in a hill and the eyes were carefully placed uppermost. They were hoed as soon as they were up, and also after they were about six inches high. Another person informs us, that he once raised over three pecks from one potato of this kind .- N. E. Farmer and Mech. Journal.

From the American Farmer. THE BEECH TREE, Proof against the Electric Fluid.

Mr. Skinner.-The communication in your paper upon the subject of the effects of lightning upon cedar, or rather its non-effect, has induced the following. I give you the facts so far as I am able, and they may lead to some further observations, which may result in usefulness.

of Ohio during the last summer, in company with ing the admiration of man, and exciting him to a gentleman who had spent his life in the woods, surveying and exploring, when a heavy thunder deed may be applied to every department of nastorm came up, and it was then observed by the ture. gentleman that we would try and find a beech tree common beauty of form, colors, and polish, but under which to take shelter. In the course of that the examination of them may enlarge the conversation it was stated that it was a common field of intellect? The inhabitant of the common opinion among surveyors and woodsmen, that the whelk is housed as safely in its simple residence beech possessed the quality ascribed to the cedar; of calcareous earth, as that of the Nautilus Pomplightning, and that during the heaviest thunder pearls and silver; and the shell of the limpet the other eighteen pounds and a quarter.—Hamp. storms, they felt perfectly secure when they could serves as well for protection, as the canopy of the Gazette.

large beech.

The statement induced me to further observatree which had been riven by lightning, without particularly to notice it; and I presume I have pasand although beech is more common than any other timber, I have not discovered one of that kind, learned upon enquiry of those who are accustomed to the woods, that such is the prevailing opinion as stated.

I give you the facts as I have them. If they are well founded, and if the timber stated has the property of resisting the effects of lightning, it is proper it should be universally known. One well attested instance of a beech having been struck by lightning would at once decide the question, and show the fallacy and error of the opinion, as it should be, if without foundation. On the contrary, if an instance of similar character with the one described in the Farmer could be referred to, the earth "apparelled with plants, (says old Gerit would go very far in establishing the position. In an agricultural view it is worth enquiry. If heech has this property as contended, and as animals in storms seek shelter, it would be well to leave, in clearing, or plant beech trees, where grazing animals might seek shelter and safety. Yours, with much respect.

Dayton, Ohio, Dec. 1, 1828.

A few days ago the gardener of Mr. Thomas Goodwell, of Eastwood, gathered a cucumber eight inches long and six inches in circumference whose blossom had never expanded; no seeds were found in the fruit. The same gardener, on the 14th inst., gathered a plate of raspberries of excellent flavor, and expects several others in a few days. An apple tree of William Lamb's in the same parish, is now in blossom, and a portion of the blossom set .- Nottingham Journal.

Improvement of Candles .- A writer in Brewster's Journal says he steeps the cotton wick in lime water in which is dissolved a considerable quantity of nitrate of potasse, common nitre, or salt petre; by this means he secures a purer flame and more superior light -a more perfect combustion is ensured-snuffing is rendered nearly as superflous as in wax candles, and the candles thus treated do not "run." The wicks must be thoroughly dry before the tallow is put to them.

"We now approach, gentlemen, a period in the life of our departed President, which brought us into close intimacy with him. It was a long period of wide-spread usefulness, in which he moved almost without a rival. As a practical farmer, Mr. Peters had from time to time communicated the results of the experiments made at Belmont, to such of his neighbors as chose to profit by them; but he had not written much, if any thing, upon agriculture, before the year 1797. His first publication was then made, and contained a statement of facts and opinions in relation to the use of Gypsum. This pamphlet circulated widely, and produced such a change in husbandry, by introducing the culture of clover, and other artificial grasses, as gave, we all know, a magical increase to the value of farms. Estates which until then were unable to maintain stock, for want of winter fodder, and summer pasture, were suddenly brought into culture, and made preductive. For-

DEW IN EGYPT AND PALESTINE. We had a tent allotted to us for the night, and although it was double-lined, so copious are the dews of Egypt after sunset, that the water ran plentifully down the tent-pole. The vegetation of Egypt, even the redundant produce of the Delta, is not owing solely to partial inundation from the Nile, or artificial irrigation. When we hear that rain is unknown to the inhabitants, it must not be supposed the land is on that account destitute of water. From all the observations we made during our subsequent residence, it seemed doubtful whether any other country has so regular a supply of moisture from above. Even the sands of the desert partake largely of 'the dew of heaven.' and in a certain degree of the 'fatness of the earth.' Hence it is that we meet with such frequent allusion to the copious dew distilled upon Oriental territories in the sacred writings. Brotherly love is compared by David to the dews of Hermon.' The goddess of Judah is described as Lord.'- Tour in Egypt.

REMEDIES AGAINST SEA-SICKNESS.

Sea-sickness has puzzled more grave doctors than one. On the present occasion I had no other resource than to submit to fate, and much good it did me. To the Countess, however, of whose health I had taken charge, and who I understood, suffered considerably from sea-sickness, I administered immediately before embarking, forty drops of Laudanum. She remained, during the whole of the passage, in her carriage, and declared to me that not only she had not been ill, but that she had not even experienced the slightest of those appalbing qualms which rob the cheeks of the most stout-hearted of their bloom, and unman us all .-Assuming the state of the stomach during seasickness to be one of irritability, this happy effect of opium can readily be understood. MASSACHUSETTS AGRICULTURAL SOCIETY.

The American Farmer gives a short history of this Society. It was incorporated in 1792, and a fund was subscribed amounting to 3984 dollars. Governor Gore was one of the contributors and gave 1000 dollars. Dr. Lettsom, of London, the celebrated philanthropist, gave ten guineas. The fund now amounts to 14000 dollars. The Society receive from the State, 600 dollars annually .-The amount of Premiums given by the Society, since the establishment of Cattle Shows, have averaged about 1200 dollars per year. In a notice of the festival, given by the Society, it is stated, that Mr. Danney of Fayal, has for the last four years presented, for the annual dinner, a quarter cask of the best Pico wine which he could find on the Island .- Salem Observer.

The potatoe was at first positively proscribed in France. Baudin relates, that in his time, its use was prohibited in Burgundy, because it was 'dew': 'The remnant of Jacob shall be,'it is said, supposed to generate leprosy! It was chiefly in the midst of many people as a dew from the through the exertions of the celebrated chymist Parmentier, that the prejudices of the French people against it were removed, and that it was brought into general use among them. Yet even, as late as the revolution, so little were the vulgar reconciled to this species of food, that on Parmentier being proposed for some municipal office, one the share he had in their introduction-" He will make us eat nothing but potatoes," said he " for it was he who invented them."-Mechanic's Mag.

> The potato trade. - We sometimes find something a little amusing, as well as much that is instructive, in the public documents. Thus, among our articles of provisions exported from the United States to Great Britain, in 1827, we find two bushels of potatos, which must have been excellent ones, as they brought us the liberal sum of two dollars. On the other hand, we imported from the dominions of Great Britain, (mostly we presume from Ireland,) no less a quantity than twenty thousand eight hundred and ninety-two bushels of potatos, of the average value of about forty cents a bushel. Deducting the two bushels we exported, for which we got two dollars, the balance of the potato trade is greatly against us-no er, because in general the younger cattle are, the and sixty hushels, equal to eight thousand four

Hand engines .- On the 4th inst, the south wing of the dwelling house of Joseph Strong, Esq. of South Hadley, was discovered to be on fire; the inside of the kitchen was soon all in flames, and a guing with sage presumption, the importance of high wind blowing towards the main house, it past, to hure some of the native grapes, I have our National Legislature, enacting laws to encour-seemed impossible to save the buildings. Some hand-numps, or engines were then obtained and put in operation, and by the use of these the fire checked, and in a short time extinguished. These small engines undoubtedly saved the whole range goes of lumber arrived at that port during the last of buildings from being destroyed by the devouring element. The damage now sustained is only two or three hundred dollars.

The utility of hand-engines for extinguishing fire has been fully demonstrated, and it would be well to bring them into more general use. They can be managed by females and children, and fire within a building, or on the roof, may be overcome in a few minutes by means of one of them and a few pails of water. They are useful also for watering gardens, washing windows, &c. They are made by Mr. Holland, of Belchertown, Mr. Horace Brainard, of Northampton, and probably by other mechanics .- Hamp. Gazette.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 19, 1828.

ECONOMY IN FEEDING CATTLE.

There is a remarkable difference in cattle's eating straw when fresh threshed, and when it has been threshed several days. But if fresh threshed straw is cut and mixed with hay of pretty good quality, and the whole sprinkled a little with a pretty strong solution of salt and water, and permitted to lie in a heap for several days the mixture will improve in quality.

Much chaff and straw that is often thrown away, may with a little pains be made good fodder for cattle, by being mixed with corn stalks out with a machine, and sprinkled with fine salt and water, if the mixture will bear wetting. The sweetness of the stalks and hay is imbibed by the chaff and straw, and the whole will make a compound very agreeable to eattle. They should not however, be confined wholly to salted food, but have fresh messes a part of the time.

When young animals are pinched for food at of the voters furiously opposed him on account of an early part of their growth, or fed with such as is not of a sufficiently good quality, they never thrive so well, nor make so good stock afterwards. It is said in Young's Farmer's Calendar, that "in the winter the vearlings should be fed with hay and roots, either turnips, carrots, potatos, mangel wurtzel, or ruta baga, and they should be thoroughly well fed, and kept perfectly clean by means of litter. At this age it is matter of great consequence to keep such young cattle as well as possible; for the contrary practice will stop their growth, which cannot be recovered by the best summer foed. If hay is not to be had, good summer straw must be substituted, but then the roots must be given in greater plenty and with more attention. To steers and beifers two years old, the proper feed is hay, if cheap, or straw, with baits of turnips, cabbages, potatos, &c. It is not right to keep yearling calves and two years old togeth-

> When a farmer is apprehensive that he has too much stock for his fodder, it is best not to stint them in their allowance as much in the fore part

as in the latter part of winter; for cattle are more lay hold of weak minds, especially of sick or hy-ldistinguish a Lythe from a Carabeus or Cetonia, liable to be pinched with cold in December and January than afterwards when they become habituated to rigorous weather. Advantage may of entomological knowledge would relieve them lishes him with a good or bad article? If a farmer proposes to feed his cattle with potatoes or other roots, it will be better to give them useful in this view, since nothing certainly is more but a small quantity at first, increasing it by de- desirable than to deliver the human mind from ments; but unless entomology were more genergrees as they become accustomed to that sort of the dominion of superstitious fears, and false no. ally studied by scientific men, who are the only food. It will, likewise, he better to give them a little every day than a large quantity once in three or four days or a week.

ENTOMOLOGY.

One would not think that the excrements of insects could be objects of terror, yet so it has been. Many species of Lepidoptera, when they emerge from the pupa state, discharge from their anus a reddish fluid, which in some instances, where their numbers have been considerable, has produced the appearance of a shower of blood; and by this natural fact, all those bloody showers, recorded by historians as preternatural, and regarded, where they happened as fearful prognostics of impending evils, are stripped of their terrors, and reduced to the class of events that happen in the common course of nature. That insects are the cause of these showers is no recent discovery; for Sleidan relates that in the year 1553, a vast multitude of butterflies swarmed through a great part of Germany, and sprinkled plants, leaves, buildings, clothes, and men, with bloody drops, as if it had rained blood. But the most interesting account of an event of this kind is given by Reaumur, from whom we learn that in the beginning of July 1608, the suburbs of Aix, and a considerable extent of country round it, were covered with what appeared to be a shower of blood. We may culturists and gardeners are conversant with inconceive the amazement and stupor of the populace upon such a discovery, the alarm of the citizens, the grave reasonings of the learned. All agreed, however, in attributing this appearance to powers of darkness, and in regarding it as the prognostic and precursor of some direful misfortune about to befall them. Fear and prejudice would have taken deep root on this occasion, and might have produced fatal effects upon some weak minds, had not Mr. Peiressé, a celebrated philosopher of that place, paid some attention to insects. A chrysalis, which he preserved in his cabinet, let him into the secret of this mysterious shower. Hearing a fluttering, which informed him that his insect had arrived at its perfect state, he opened the box in which he kept it. The animal flew out and left behind it a red spot. He compared this with the spots of the bloody shower, and found they were alike. At the same time he ohserved there was a prodigious quantity of butterflies, flying about, and that the drops of the miraculous rain were not to be found upon the tiles. nor even upon the upper surface of the stones, but chiefly in cavities and places, where rain could not easily come. Thus did this judicious observer dispel the ignorant fears which a natural phenomenon had caused.

Every one has heard of the death-watch, and knows of the superstitious notion of the vulgar, injurious to the general welfare or affect the anthat in whatever house its drum is heard one of the family will die before the end of the year.

pochondriac persons, may cause the event that is both of which I have found mixed with the formsupposed to he prognosticated. A small degree er, how can he know whether his druggist furnand is merely a call to its companion. Attention from the cultivated. to entomology may therefore be rendered very tions, which having considerable influence on the persons likely to make any discoveries of this kind, conduct of mankind are the cause of no small por- than it has hitherto been, we must not hope to detion of evil.

But as we cannot well guard against the injuries produced by insects, or remove the evil, whether real or arising from misconceptions respecting them, which they occasion, unless we have knowledge can we apply them, when beneficial to our use. Now it is extremely probable that they might be made vastly more subservient to our advantage and profit than at present if we were hetter acquainted with them. It is the remark of an perties. author, who himself is no entonologist: "we have not taken animals enough into alliance with us. The more spiders there were in the stable, the less would the horses suffer from the flies. The great American fire-fly should be imported into Spain to catch mosquitos. In hot countries a reward should be offered to the man who could discover what insects feed on fleas." It would be worth our while to act upon this bint, and a similar one of Dr. Darwin. Those insects might be collected and preserved that are known to destroy the aphides and other injurious tribes; and we should thus be enabled to direct their operations to any quarter where they would be most serviceable;but this can never be done till experimental agrisects, and acquainted with their properties and economy. How is it that the great Being of beings preserves the system which he has created from any permanent injury, in consequence of the reduncancy of any individual species, but by employing one creature to prey upon another and so overruling and directing the instincts of all, that they may operate most, where they are most wanted! We cannot better exercise the reason, powers, and faculties with which he has endowed us. than by copying his example. We often employ the larger animals to destroy each other, but the smaller, especially insects, we have totally neglected. Some may think, perhaps, that in aiming to of attempting to take the government and direc- parts of the state and country. tion of things out of the hands of Providence;but this is a very weak argument, which might with equal reason be adduced to prove that when rats and mice become troublesome to us, we ought not to have recourse to dogs, ferrets, and cats to ficers were appointed, viz .-exterminate them. When any species multiplies upon us, so as to become noxious, we certainly have a just right to destroy it, and what means can be more proper than those which Providence Dox, James Wadsworth, James K. Guernsey, Daitself has furnished? We can none of us go fur- vid E. Evans, and Herman H. Bogert, Vice Presither or do more than the Divine Will permits; dents. and He will take care that our efforts shall not be nihilation of any individual species.

There are, it is probable, many insects that might be employed with advantage in both these departrive further profit from them. It seems more particularly incumbent upon the professors of the divine art of healing to become conversant with this as well as other branches of Natural History; for not only do they derive some of their most some knowledge of them; so neither without such useful drugs from insects, but many also of the diseases upon which they are consulted, are occasioned by them. The profit we derive from the works of creation will be in proportion to the accuracy of our knowledge of them and their pro-

Adams, Samuel These terrors, in particular instances, where they in medicine or the arts, if the apothecary cannot E. Ellsworth, George Hosmer, Elisha B. Strong, Jacob Le Roy, and Bowen Whiting, Committee of

The Society embraces the counties of Onondaga, Cayuga, Seneca, Tompkins, Ontario, Wayne, Yates, Monroe, Livingston, and Genesee; and the vice presidents and committee of managers are selected one from each of those counties .-Previous to the organization of the Society, an initiatory discourse was delivered by MYRON HOLLEY, Esq. a copy of which has been requested and obappointed to deliver the next address.

New Printing Press .- That "this is an age of improvement," is in nothing perhaps more strongly verified than in the advances made within the last few years in the art of printing. But a short period bas clapsed since the screw press was deemsubstitutes have been invented, and great saving of time and labor effected. But we have heard of none in which these objects have been so thoroughly attained as in one lately constructed and now in successful operation in this village. It is the invention of an ingenious mechanic of this place, and constructed for Messrs. Holbrook & Fessenden, who have spared no expense in bringing it to a comparative state of perfection. It is moved by water power, but may be carried by steam, horse, or otherwise, as may be most convenient. It requires the labor of two girls only to tend it, one to lay on and the other to take off the

The construction is simple, and the machinery little liable to get out of repair ; it is also compact, occupying little more space than the common hand press. The expense of this press, compared with the facility of its operations and the reduction of labor, is by no means extravagant, not exceeding four times the cost of an iron hand press, while it does the work of more than two at one quarter the expense, and in a superior style.

We have always doubted the feasibility of constructing a good press in which cylinders should give the impression, and believe that platens, which are used in the one under present notice, will always be necessary to give a clear and handsome impression. It is also doubted whether much greater facility can be given to a platened press than is possessed by the above, which throws off about twelve sheets a minute, which is as rapid as the best of the sheets a minute, which is as rapid as the best of the sheets and the sheets and the sheets are sheet of the sheets and the sheets are sheet of the the sheets can safely be applied.

Thus far we have stated what has been done and is now doing every day. We understand however that Messrs. H. & F. have another press now constructing which will embrace some improvements; it is contemplated to remove the sheets by machinery, and thereby dispense with the labor of one hand, in which case the expense of printing will be yet farther reduced.

Measures, we are told, are being taken to secure the exclusive right to the above invention both in this country and Great Britain; and so fully satisfied are the proprietors (Messrs. Helbrook & Fessenden & E. H. Thomas) of the superiority of their press, that they intend shortly to manufacture them for sale, of various sizes, suitable for newspapers or other work. They have our best wishes for success, as the public must necessarily be benefitted by every additional facility provided for the diffusion of knowledge. - Brattleboro Reporter.

Horticulture.—The Philadelphia Aurora introduces an account of the late meeting of the Philadelphia Horticultural Society, with the following judicious remarks on the importance of a good garden :- We take the opportunity, on placing before our readers an account of the proceedings of a late meeting of the Horticultural Society, to say a few words in behalf of this meritorious institution. Travellers and residents of observation, have remarked the want of attention in the intertained for publication. T. D. BURBALL, Esq. was jor of the United States, to horticulture and gurdening generally. This is a great blemish, besides being a serious loss. A house, having a productive, handsome garden attached to it, will bring twenty or twenty-five per cent, more rent than one without a garden, and the property is that much more valuable. Apply this to the whole State, and see the importance of horticulture, even ed the only machine of practical utility in printing; in a pecuniary point of view, and, in addition, we but it is now fast getting out of use. Numerous may have the luxuries of delicious fruits and veg-

> Worcester Canal .- 'The inhabitants of Worcester and vicinity have derived but little benefit from the open state of the canal during the mild weather of the last fortnight, although they had hundreds of Also, Peach and Almond Stones, and many other valuable Front tons freight, which they were anxious to get up. The reason is, that all the boats now on the canal, can be more profitably employed in doing the business of the lower end of the route. We hope our citizens will take measures to have a regular line of boats from this place early in the spring .-Worcester Spy.

It is found in South Carolina, that a species of "Hemp," similar to the Manilla, but rather more silky in appearance, can be obtained from the plant Okra, which abounds in that state.

Wanted Immediately,

Six or eight Journeyman Chair Makers, at the Newburyport Chair Factory.—Cash and the highest price given.—Apply to Nathan Haskell, Agent for the Pruprietors. Newburyport, Dec. 19. 1828. 3t

Winter Keeping for Horses in the vicinity of Boston, Where the most faithful care may be relied on, may be had on application to Major Samuel Jaques, Charlestown, or Mr. T. J. Niles, School Street, or to Mr. Russell, Publisher of the New England Farmer. An early application is desirable.

Garden and Field Seeds.

prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1828. Also, Lucerne, White Clover, Fowl Meadow, and every other kind of Grass cultivated in New England.

White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulherry Seed, raised in Coventry, Con, this season, and saved with care expressly for us—For sale by the lb. or ounce. Shallnts for fall planting, Tree and Potato Omens.

Roots of the Pie-Plant, or Tart Rhubarb.

Alarge supply of the roots of the Rheum Undulatum, or Tart Rhubart, or Pie-Plant, an excellent article for summer use. (See N. E. Parmer, vol. vi. page 290, and page 11 of this volume, and Fessenden's New American Gardener, article Rhubarh, lor its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 ets. per root

Seed Potatos.

A few bushels La Plata or Long Red Potatos, raised by Mr Gourgas of Weston; selected for seed, of a uniform size, and much improved as to their earliness, by the careful attention of Mr G. For sale at the

New England Farmer Seed Store, No. 52 North Market, Street-Boston.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Ranmiculus, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts. each. A very few of the finest Hyacinths, dark and pate blue, pure white, red, yellow, and white with various eyes, at \$1 per root.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, cau be furnished with boxes of Seeds, assorted, suitable for that market, at from \$4 to \$5 per box.—Each box contains opwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.-Likewise the greatest variety of seeds to be found in New Eng land, by the poond or bushel, all warranted pure, and of the growth of 1837.

Field Peas.

A consignment of 30 bushels of Field Peas, from Vermont, of the growth of 1827, in good order. They will be sold by the tierce at \$1.75 per bushel.

Out Meal, &c.

Fine Oat meal and Out Flour, Hulled Oats, Hulled Barley. Barley Fluor, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vernount.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and solitable for sending to Europe, or for cultivation here. Price 26 ets a paper. They were gathered by a gentleman familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity.

and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

New England Farmer Seed Store, No. 52 North Market Street-Boston.

MISCELLANIES.

THE INDEPENDENT FARMER.

BY T. G. FESSENDEN.

It may very truly be said That his is a noble vocation, Whose industry leads him to spread About him a little Creation.

He lives independent of all Except th' Omnipotent Donor; Has always enough at his call. And more is a plague to its owner.

He works with his hands, it is true, But happiness dwells with employment. And he who has nothing to do Has nothing by way of enjoyment.

His labors are mere exercise. Which saves him from pains and physicians; Then, Farmers, you truly may prize Your own as the best of conditions

From competence, shar'd with content, Since all true felicity springs, The life of a Farmer is blent With more real bliss than a king's,

Dr. Walcott, better known as Peter Pindar, had for a time, a Dr. Walcott, better known as refer rimar, had for a time, a most violent cough, when his friend. Dr. Geach, persisted in recommending asses' milk as a certain eure. The bard, (tired of his importunities, at length quieted him by sending the following epigram-

And Doctor do you really think That asses' milk I ought to drink? 'T would quite remove my cough, you say, And drive my old complaints away. It cured yourself-I grant it true ; But then-'t was mother's milk to you.

Thomas Fuller, the historian, so well known for his quaint sayings and bright points, was one day riding with a gentleman named Sparrowhawk .-The name roused his fancy, and he asked him what was the difference between "a Sparrowhawk and an owl? "Why, sir," replied his companion, "the owl is fuller in the head, fuller in the body, and fuller all over.

Profitable ingenuity .- Two sweep boys wishing to go over Waterloo bridge, and having only a penny between them, determined to cheat the collector, by one getting into the sack, and his companion to carry him across on his back. They tossed which should be bagged, and the loser in a few minutes was on his companion's back, and passed through the gate as a bag of soot. The trick was discovered by a Bow-street parole, who communicated it to the gate keeper, and he having followed the boys, they confessed that it was for the want of a penny that had caused them to "bilk the gate." The crowd immediately entered into a little subscription, and in a short time a few shillings were raised and given to the sweeps, who appeared not a little pleased at the issue of their comical incident.

From the New York Advertiser.

NEWSPAPERS IN ENGLAND.

In London newspapers an advertisement making ten lines, amounts to five dollars and ninety-four half the original price of the paper, where it is eents for three insertions. In a New York paper read by dozens. It is in this way that the agents

the office counts out to them twenty-seven slicets to the quire, thus giving them three papers above the nominal number, as their profit for selling on the quire.

All these carriers have their routes for each daily as well as semi-weekly and weekly papers carrier has for selliog papers, it may not be amiss marked out, and beyond those limits they consid-here to state, that such a district is considered as er themselves as having no right to pass, each confining himself to his own district.

The moment the carriers obtain their papers, they go off at full speed, for the various public places in their respective districts, from whence the hundreds of public coaches, morning and evening, depart for all parts of the kingdom. Here they beset the passengers with "Buy the Times, sell their right to beg in particular districts. sir,"-"Buy the World, madam,"-"Buy Life in London, miss," &c. in all keys, from the coarse, dissonant note of the old man, to the firm voice many of them are of dissipated habits. It is asof the middle aged, and the treble tones of the youth. Others are besetting the strangers in other quarters, who are about to leave the metropolis by packets and steamboats. These carriers, by way of inducement for persons to purchase, often give a brief summary of the most interesting contents of their respective papers, all claiming that their journal contains the most authentic accounts, the very latest news, the fullest particulars-no matter whether it be a battle in Turkey in which 50,000 men have been slain-a most attached to the same office, when they hurry off, diabolical conspiracy discovered in Cato-street, in and correct their minutes at the office, place the West End, or a trial in a court of law.

Other carriers are trudging their round among their customers, who pay for the paper on delivery; or, if they be well known and well established, receive a limited credit.

Notwithstanding the daily selling of papers is more or less precarious, yet these agents not unfrequently grow rich by their business, and, to show how they acquire their wealth, we must be permitted to tell the story. For instance, the paproprietor of the Goose and Gridiron, in St. Paul's Church-yard, for seven pence; he wants it but a day; and on Tucsday he sells it to the carrier for to a second or third-rate house, at the price of sixpence-buys it again on Wednesday, for three pence, and furnishes it to some small victuallinghouse the same day for four pence-buys it again for three pence, to some low place of entertainpenny, and then despatches it to the country at which the reporter may be in at the moment. The price of a daily London newspaper is seven penee sterling, which is about thirteen cents. The papers are sold by agents, who are the only persons in England get the reading of newspapers, which they could not otherwise enjoy, were they under the necessity of paying full of the proprietors as their customers. This class of persons are recorded to the response are recorded to the papers are sold by agents, who are the only per- joy, were they under the necessity of paying full sons known to the proprietors as their customers. Price. For, be it remembered, the habit is not and is marked "E. Copeland, jr. Beston," on the head of the contract of the proprietors are their customers. This class of persons are respectable men, and in there as it is here, we mean the habit of borrow- cask

many instances possess considerable property. ing. In the ordinary public houses, but one, and They have sub-agents or carriers, in number pro- in others better supported, two of the daily, and portioned to the extent of their business. It is perhaps one weekly paper are taken; and it is not this class, (the carriers) who make their appear-uncommon for the proprietors to advertise it on a ance at the various daily offices, at the hours of sign in front of their houses-such for instance publication, and, the moment the papers are re- as "The Times taken in here," or "The Morning ceived from the press, purchase them at the coun-Post, and British Traveller taken in here." At ting house of the office, paying in ready money for these houses, to prevent any difficulties, the nicest the number they take. The papers are sold to etiquette is observed. Whoever first makes his these agents or carriers at the original price of appearance asks for the paper, and to him it beseven pence sterling a paper by the quire; but to longs for the first reading; the person who asks enable them to make a living by their business, for it next, receives it in his turn; the paper being handed to the waiter by the person who first read it, the momen the has finished; and in this way it passes from one to the other in regular succession.

Regarding the routes or districts which each much his property, as though he possessed a fee simple right in it. Others will not dare to interfere with his rights. These districts, if known to be good ones, often sell for a large sum of money. This, however, is not so singular; as it is a fact, which is said to be well authenticated, that beggars in London have frequently been known to

Reporters. The persons employed as reporters, are, generally speaking, men of fine talents, but tonishing to learn the facility which they acquire, by habit and necessity, of taking down the debates in Parliament, or dressing up a story of any kind for the press. During the sitting of Parliament is their harvest. In the capacity of reporters a place is assigned them in the gallery; and standing or sitting together, should a sentence escape one of them, he turns an eye to the reporter next him. and takes it from his minutes. They continue to sketch the debate till relieved by other reporters, copy into the hands of the compositor, and present themselves again in the house, to relieve their substitutes. Other reporters attend to the various courts, police offices, &c. gathering the occurrences of the day or night,

In a dry time, when little foreign news is stirring, the most trivial circumstances are worked up. by their superior talents, aided by fancy and fiction, to affairs of dreadful note, and always with a heading calculated to arrest attention; such as per is sold on Monday, to Mr. Goodfellow, the a "Most unparalleled murder!"-" Extraordinary disclosure!"-"Frightful accident!"-"Unprecedented cruelty!"-"Wonderful escape!"-"Horrid affair!"-and "Most extraordinary leap!" &c. &c. four pence-the carrier, (by contract) furnishes it An excellent story is told of an occurrence before a police magistrate, which the magistrate never heard of before he read it in the papers. Accidents and hair-breadth escapes are coined by dozens; and instances of the shocking barbarity, acts on Thursday for two pence, and sells it on Friday of great liberality, and astonishing feats are performed with wonderful liberality, each story bement-on Saturday he gets it for a penny half- ing written according to the peculiar mood in

Gunpowder, &c.

NEW ENGLAND FARMER.

Published by John B. Russell, at No. 52 North Market Street, (over the Agricultural Warehouse) .- Thomas G. Fessenden, Editor.

VOL. VII.

BOSTON, FRIDAY, DECEMBER 26, 1828.

No. 23.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

BARLEY.

MR FESSENDEN-1 received the inclosed from Dr BRADFORD, some time since, as you will see by the date of his letter, and intended you should have had it for pubsome of my agricultural friends, which has caused the delay; when it is considered that Dr BRADFORD is concerncd in an extensive brewery, and very competent to investigate and determine the quality of barley, it cannot be doubted the publication of his letter will tend to induce enlivators to give their attention to the subject. The Barley, Wheat, and Rye, which I raised this year was ordinary, the kernels much shrivelled, the barley weighing only forty-one pounds per bushel; much of this may be imputed to the season, which was unfavorable for every kind of grain (Indian corn only excepted) in my neighborhood, but a large part of the failure, I am inclined to think, was owing to the quality of the seed.

> Your friend and humble servant, GORHAM PARSONS.

Brighton, Dec. 24, 1828.

DEAR S1a-You may remember, some time since, a conversation respecting barley and that you then observed that any information on the subject would be put in a proper train for reaching those interested in the improvement of agriculture. The following extract from an article on Brewing, written by Professor Thomso contains miley things that I think should be known to farmers, since it is evidently for their interest to cultivate a valuable, instead of an indifferent arti-

"Barley is the seed of the Hordeum rulgare, a plant which has been cultivated from time immemorial, chiefly for the manufacture of beer .-There are two species of Hordeum under cultivation in Britain; 1st. The Hordeum vulgare, or barley, in which the seeds are disposed in two rows on the spike. This is the species usually cultivated in England and in the southern parts of Scotland. 2d. The Hordeum hexastickon, called in the South of Scotland bear, and in Aberdeenshire, big. In this species the grains are disposed in two rows as in the other; but these of big appears to have the seeds disposed in six rows. Big is a much more hardy plant than barley and ripens more rapidly. Hence it thrives better than barley in cold and bigh situations .-On this account it is sown in preference in the Highlands and northern parts of Scotland, where the climate is colder than more to the south. We have been assured that there is a third species of Hordeum cultivated in Scotland, in which the seeds in the spike are arranged in four rows. To this the term bear is exclusively confined by some. We have not, ourselves, had an opportunity of examining this species, nor do we find it noticed by botanists. The trivial name tetrastichon might be applied to it.

The grains of barley are much larger than those of big, and the cuticle which covers them is thin-

in which it is cultivated, being always the thinner, grains nearly of a size, though in some cases, the the warmer the climate.

The specific gravity of barley is rather greater spike is rather smaller than the rest. than that of big. The average weight of a Win- These circumstances may strike the reader as lication much sooner, but was desirous of showing it to weighed 52-265 lbs. per bushel, and the heaviest stances that occur when these two species of horascertained by sowing a quantity of it-but the ing it at least 20 per cent." proportion of barley was very small. The aver- Such are the remarks of Professor Thomson, age weight of a grain of barley is 0-6688 of a and they are founded on very careful experiments. grain or nearly two. The average weight of a My own opportunities of making similar experigrain of big is 0-5613 of a grain. The average ments and acquiring similar information respectlength of a grain of barley from many thousand ing the barley of this country, have been too limitadmeasurements is 0-345 of an inch, while that ed to speak at much length concerning the matof a grain of big is 0-3245 of an inch. The av- ter. As far as I have been able to ascertain, erage breadth of a grain of barley is 0-145 of an there are four species cultivated, namelyinch, while the average breadth of a grain of big is 0-136 inch. The average thickness of a grain ley. This agrees with Professor Thomson's desof barley is 0-1125 inch, while that of a grain of cription, and is the most valuable, though unfortubig is 0-1055 inch. Thus we perceive that the nately the least common species. It is known by grain of big is smaller than the grain of barley in the name of two-rowed barley. A bushel of this all its dimensions.

> of barley and big, we made choice of three parcels sample, weigh from 50 to 54 pounds. of grain, all excellent in their kinds, namely, Noreach of these is as follows.

Weight of a corn in grains. 0-6809 " Norfolk barley 0-7120 " Haddington barley 0-5408 Lanark big

Weight of skin in grains. 0-110 or 1-6 Nerfolk barley Haddington barley 0-123 or 1-6 Lanark big 0-125 or 1-5

From this we see that there is little difference | ed barley. between the weight of the skin of Norfolk and Haddington barley; but a very considerable one monly known to our farmers, I believe, by the between Haddington barley and Lanark big .-Hence it would seem that this difference is not as asserted by Thomson, in six rows, or rather owing to the climate in which the barley vegetates, but rather to a difference in the nature of answers his description very well, and is an infeseeds spring from the same point, so that the head the species. The bulks of these two species of rior grain-seldom weighing more than 46 lb. grain are to each other as follows.

AGRICULTURE.

The following article was written for the Conversation-Lexicon, a Popular Encyclopedia, translated from the German, with Corrections and Large Additions, edited by Dr FRANCIS LIEBER, and soon to be published by Carey, Lea & Carey, Philadelphia. By the Editor of the New England Farmer.

Agriculture is the art of cultivating the earth in such a manner as to cause it to produce in the greatest plenty and perfection, those vegetables which are useful to man, and to the animals which he has subjected to his dominion. This art is the basis of all other arts, and in all countries coeval with the first dawn of civilization. Without agriculture mankind would be savages, sparsely scattered through interminable forests, with no other habitations than caverns, hollow trees, or huts more rade and inconvenient than the most ordinary hovel or cattle-shed of the modern cultivator. It is the most universal as well as the most ancient of the arts, and requires the greatest number of operators. It employs seven-eighths, and feeds in the earliest and purest times of the Republic, the whole mass of population of almost every civilized community. Agriculture is not only indispensable to the prosperity of a nation at large, but is eminently conducive to the welfare of those who are engaged in its pursuits. It gives health to the body, energy to the mind, is favorable to virtuous and temperate habits-that knowledge and purity of moral character, which are the pillars of good government, and the only supporters in the hour of danger.

With regard to the history of agriculture, slight the present, professes rather to present general history has afforded of agriculture, are found in agricultural subjects. the writings of Moses. From them we learn that Cain was a "tiller of the ground," that Abel sacrificed the "firstlings of his flock," and that Noah "began to be a husbandman and planted a vineyard." The Chinese, Japanese, Chaldeans, Egyptsensible of the blessings resulting from that art, that they ascribed its invention to superhuman agency; and even carried their gratitude to such ox, as a tribute due to the animal for his services as a laborer. The Carthagenians cultivated the science, and carried the art of agriculture to a higher degree than other nations their cotemporaries. Mago, one of their most famous generals, wrote no less than twenty-eight books on agricultranslated into Latin, by an express decree of the Roman Senate.

Hesiod, a Greek writer, supposed to be cotemporary with Homer, wrote a poem on agriculture, entitled "Weeks and Days," which was so denominated because husbandry requires an exact of the vine and olive.

namely, the barley or bear, being grains of slower very few and simple. Those mentioned by Hesishare-beam the draught-pole and the plough-tail: but antiquarians are not agreed as to the exact form of the implement. A cart with low wheels, Watering on a large scale was applied both to and ten spans (seven feet six inches) in width .-The rake, sickle and ox-goad are mentioned, but no description is given of the mode in which they were constructed. The operations of Grecian culture according to Hesiod were neither numerous nor complicated. The ground received three ploughings, one in autumn, another in spring, and the scientific husbandmen of Rome, was, in gena third immediately before sowing the seed. Manures were applied, and by Pliny their invention is ascribed to the Grecian king Augeas. Theo-lage is illustrated by the following apologue. "A phrastus mentions six different species of manures, vine dresser had two daughters and a vineyard; and adds that a mixture of soils produces the same when his oldest daughter was married he gave effect as manures. Clay, he observed, should be her a third of his vineyard for a portion; notwithmixed with sand, and sand with clay. Seed was sown by hand, and covered with a rake. Grain was reaped with a sickle, bound in sheaves, threshed, then winnowed by wind, laid in chests, bins, or graparies, and taken out as wanted by the This result was the consequence of his bestowing family, to be pounded in mortars or quernmills as much labour on the third part left after his into meal.

The ancient Romans venerated the plough, and the greatest praise which could be given to an illustrious character was to say that he was an industrious and judicions husbandman. M. Cato, their comfort and happiness seemed to be the inthe censer, who was celebrated as a statesman, orator and general, having conquered nations, and governed provinces, derived his highest and most durable honours from having written a voluminous work on agriculture. In the Georgics of Virgil the majesty of verse and the harmony of num- happiness. To facilitate communications from of national independence, which can be relied on bers add dignity and grace to the most useful of all topics. Columella, who has been celebrated been a primary object of the Romans, and the as a writer, flourished in the reign of the emperor sketches only can be given in a work, which, like Claudius, and wrote twelve books on husbandry, discernible in numerous places. By employing which constituted a complete treatise on rural af- their troops in this way, when not engaged in outlines than minute dilineations of the subjects, fairs. Varro, Pliny, and Paliadius were likewise more active service, their commanders seem to which it brings to view. The first notices, which among the distinguished Romans, who wrote on lave had greatly the advantage over our modern

culture, we learn that they used a great many, but their strength and relax their morals, the Roman their particular forms and uses are so imperfectly described that very little is known concerning them. From what we can ascertain respecting ians and Phonicians appear to have held husband- them, they appear more worthy of the notice of subjugated." ry in high estimation. The Egyptians were so the curious antiquarian than the practical cultivator. The plough, the most important implement succeeded the fall of the Roman empire, agriculof agriculture, is mentioned by Cato as of two ture was almost wholly abandoned. Pasturage kinds, one for strong, the other for light soils .superstitions and absurd excess as to worship the Varro mentions one with two mould boards, with which, he says, "when they plough, after sowing the seed, they are said to ridge." Pliny mentions a plough with one mould board, and others with a coulter, of which, he says there are many kinds.

Fallowing was a practice rarely deviated from by the Romans. In most cases a fallow and a tural topics, which, according to Columella, were year's crop succeeded each other. Manure was collected from nearly or quite as many sources as have been resorted to by the moderns. Pigeon's dung was esteemed of the greatest value, and next to that a mixture of night soil, scrapings of the streets and urine, which were applied to the roots vers of their lands, and were celebrated in history

The Romans did not bind their corn into area to be threshed, and was separated from the chaff by throwing it from one part of the floor to The implements of Grecian Agriculture were the other. Feeding down grain when too luxuriant was practised. Virgil says, "What commendation shall I give to him, who, lest his corn should lodge, pastures it while young, as soon as the blade equals the furrow. Geor. lib. 1, 1. 111. arable and grass lands. Virgil advises to "bring down the waters of a river upon the sown corn, and when the field is parched, and the plants drying, convey it from the brow of a hill in channels." Geo. lib. 1, l. 106.

> The farm management most approved of by eral, such as would meet the approbation of modern cultivators. The importance of thorough tilstanding which be had the same quantity of fruit as formerly. When his youngest daughter was married, he gave her half of what remained, still the produce of his vineyard was undiminished."daughters bad received their portions, as he had been accustomed to give to the whole vineyard.

The Romans, unlike most conquerors, instead of desolating improved' the countries which they subdued. "To benefit mankind and increase variable wishes of the Roman commanders. They seldom or never burned or laid waste the country which they conquered, but rather strained every nerce to eivilize its inhabitants, and introduce the arts necessary for promoting their comfort and one district or town to another seems to have works of this kind, accomplished by them, are still generals. Instead of suffering their soldiers to With regard to the Roman implements of agri- loiter in camps, or riot in towns, and thus enervate commanders kept their soldiers regularly at work, and what was still better, at work on objects highly beneficial to the interests of those whom they

In the ages of anarchy and barbarism which was prefered to tillage, and the reason for such preference consisted in the facility with which sheep, oxen, &c. can be driven away or concealed on the approach of an enemy.

The conquest of England by the Normans contributed to the improvement of agriculture in Great Britain. By that event many thousands of husbandmen from the fertile and well cultivated plains of Flanders, and Normandy, settled in Great Britain, obtained farms and employed the same methods in cultivating them which they had been accustomed to use in their native countries .-Some of the Norman barons were great improvfor their skill in agriculture. The Norman clergy,

and especially the monks, were still greater improvers than the nobility. The monks of every monastery retained such of their lands as lay most convenient to their own possessions, which they cultivated with great care under their own inspection, and frequently with their own hands. The famous Thomas Becket, after he was archbishop the monks of the monastery where he happened and making their hay. The implements of agriculture in this period, were similar to those in most common use in modern times. The various operations of husbandry, such as manuring, ploughing, sowing, harrowing, reaping, threshing, winnowing, &c. are incidentally mentioned by the writers of those days; but it is impossible, to colleet from them a definite account of the manner in which those operations were performed.

The first English treatise on husbandry was Fitzherbert, Judge of the common pleas. It is entitled The Book of Husbandry, and contains directions for draining, clearing and enclosing a farm, and for enriching and reducing the soil to tillage. Lime, marl and fallowing are strongly recommended. " The author of The Book of Husexperience of more than forty years, and if we except his biblical aliusions, and some vestiges of the superstition of the Roman writers about the influence of the moon, there is very little of his work which should be omitted, and not a great deal that need be added, in so far as respects the culture of corn, in a manual of husbandry adapted to the present time."

Agriculture attained some eminence during the reign of Elizabeth. The principal writers of that period were Tusser, Googe, and Sir Hugh Platt. Tussers Five Hundred Points of Husbandry was published in 1562, and has been recommended to be taught in schools. The treatise of Barnaby Goege, entitled Whole Art of Husbandry, was printed in 1558. Sir Hugh Platt's work was entitled many valuable hints on the progress of husbandry in the early part of the reign of Elizabeth. Among land.

and notices of their works may be seen in Loudon's Encyclopedia of Agriculture. From the restoration down to the middle of the eighteenth century very little improvement took place. Immediin the process of culture was introduced by Jethro Tull, a gentleman of Berkshire, who began to drill service by exciting inquiry, and calling the attento substitute additional tillage in their place, were prominent defects in his system. (To be continued.)

Maj. A. Perkins has printed for 127 Banks, the bills of which, it is said, have never been successfully counterfeited.

CULTURE OF HEMP.

the following article on the culture and cleaning first or second operation. No matter whether the of Hemp, it is proper to remark: that though much process be begun in the fall or the spring, provided credit is due to the writer for his voluminous and it be completed before the sowing or the planting of Canterbury used to go out into the field with useful compilation of facts, still he is mistaken in of the seed. As regards the time for sowing and the belief that hemp will not grow, " or grows but planting: this must depend entirely on the state to reside, and join with them in reaping their corn feebly on sandy or gravelly land;" and that its or condition of the land, in reference to its dryness culture is alone confined to low or "moist soils." That "sandy or gravelly lands" may be profitably devoted to the culture of hemp, if they be naturally rich, or made so by manure or plaister, many of the farmers of this county and Saratoga can able in northern latitudes. It requires a strong certify from actual experiment. Hemp, it is most clear, like all other crops, is produced more abundantly on strong or fertile lands: and it is equally region seem peculiarly adapted to it; as any one elear that there is nothing in the soil itself pecu- may have observed its luxuriant growth where it liarly adapted to the culture of this article. Much, published in the reign of Henry VIII. by Sir A. however, depends on the season, in the production of different soils of the same strength and state of cultivation. It is an axiom among farmers that their uplands, of equal richness produce corn, wheat, potatoes, &c. more luxuriantly in cold and wet seasons, than their bottom or lowlands; and light and free from weeds. Stubble or sward that the latter produce best in dry and hot seasons. bandry," says Mr Loudon, " writes from his own The same remark is also applicable to the hemp crop, as experiment has abundantly demonstrated. Last season, it will be recollected, was unusually wet in this section of the country, and while the upon the state of the soil. It is usually about the "sandy and gravelly lands" produced a fine growth of hemp and of a good quality, the alluvial, or "moist soils," produced "but feebly." In our last number we gave satisfactory evidence, it is believed, of the erroneousness of the opinion which tivator or horse shoe. CHEMICAL EXPERIMENT.

A new Fire-Screen for the Ladies .- Draw a landscape on paper with common Italian ink, representing a winter scene, or mere outline; the folimuriate of copper, (yellow,) and acetate of cobalt, (blue,) all which colors dry in invisible; but on the screen being held near the fire, the gentle warmth will occasion the trees, flowers, &c. to display themselves in their natural colors, and winter is magically changed to spring. As the paper cools, the colors disappear; and the effect may be repeated as often as desired.

Our countrymen sometimes leave potatoes as legacies to the nations whom they visit. Mr Bogle brought them to Thibet, and in that country they are called "Bogles." The Hindoos regard them as the best boon bestowed upon them by the English. Sir John Malcolm introduced them into the garden at Bushire, and now they are abundant on the coast of the Persian Gulf, and distinguished by the name of " Llalcolm's Plum."

WOBURN ACADEMY.

On Wednesday the 3d inst. the academy in Woburn was opened, and the handsome edifice dedicated by appropriate services, commencing by services. It is intended by the Trustees, and wanting, to make this institution equal to any in our highly favored land; especially for instruction in such branches of education as may qualify for active business, as well as in sound literature, and the moral and religious cultivation of the mind .--Instead of a gymnastic establishment, it is contemplated that the students shall have a far more healthful and useful exercise, by occupying a small portion of their time in labor, either in a garden, (there being several acres of land attached to the Institution for that purpose,) or at some Bost. Rec. & Tel.

Impostor .- An impious wretch has recently appeared in Ohio, who declares that he is Jesus Christ, and that he has come to judge the world. him, prostrating themselves at his feet, and calling him God. Some of them were formerly considthree days they work for their lord. When the committee of managers are selected, one from cred respectable citizens. One man knowing the injury he had done to his followers, gave him a thrashing, and drove him out of the place. A few sound drubbings will doubtless divest him of his pretended omnipotence .- Ib.

> Flour and grain have advanced a little in New York. On Friday last flour was sold from \$7 75 to 8 25 per barrel; wheat I 62 per bushel; rye 0 67. In 1827 the wheat received by the canal was 1,290,552 bushels; this year it has been only 565,902 bushels-decrease 724,650 bushels.-Supplies of wheat come in freely from the south.

> Large Crop .- From two bushels and two thirds of a bushel of potatoes, planted by Lt. Timothy Eaton, of East Pond Plantation, this season, he had the astonishing product of one hundred and thirty bushels.

Extraordinary Vegetable Production .- A Cabbage which grew at the farm of Mr Shubrick, on the neck, was this morning (Dec. 4,) brought to age to be painted with muriate of cobalt, (green,) this office; it measures in circumference between 40 and fifty inches-and is as large a vegetable of its kind, in size, as was perhaps ever seen .--Charleston Patriot.

> Losses in New York by Fires .- Mr Jameson Cox has presented the City Council of New York an estimate of the losses by fire during eleven months of the present year, 1828-which amount to the enormous sum of six hundred and eighty thousand dollars .- N. E. Palladium.

> The coffers of the Bank of England are stated to contain gold to the amount of thirteen millions

So great is the vintage the present year in some parts of France, that it is stated in many villages the vintners will give two hogsheads of wine for an empty cask.

FLOODING OF LANDS.

Where swamp land is to be cleared, and it can be flooded, by making a dam at the outlet, at a small expense, it is a matter of economy to attend to this, as in this way its growth of wood can be completely killed. This may also be performed on lands, after they are cleared, for the purpose of killing the grass, if it be bad, in order with more case to introduce a better kind, or a better system of culture. Flooding also serves, in a greater or a less degree, to enrich the land; though this depends chiefly on the kind of water with which it is flooded. If it contain a rich sediment, it is good; but, if destitute of this, it is of no u.-2 .-Farmer's Assistant.

GROVES.

These are both ernamental and useful. To plant heights of ground, the sides and tops of which are generally not very good for tillage or and is at the same time highly useful, as it regards the quantities of firewood which may be produced from such spots. Planting rows of trees along highways is also pleasant for shade to the traveller, and profitable to the owner of the soil. The same may be observed, in regard to lanes, and to passages from the highway to the mansion-house. Sugar-maple trees, planted round the borders of meadows, and some straggling ones in them, are very pleasant and profitable, as they do no injury to the growth of the grass. Wherever trees can be planted in pastures and along fences, without doing injury to the growths of the adjoining fields by their shade, this part of rural economy ought never to be omitted.

The shade of some kinds of trees is much more hurtful to the growth of plants than others.

"I planted Indian Corn (says Mr Livingston) on the west side of a young wood, consisting of oaks, poplars, a few chesnuts, and a large mulberry somewhat advanced into the field. The shade made by the rising sun extended nearly across the field, and was not entirely off until about ten e'clock. I remarked that, as far as the shade of the chesnut reached, the corn was extremely injured; it was yellow and small. The conical shape of the morning shade from particular trees might be traced a considerable extent, in the sickly appearance of the plants. The black oaks were likewise injurious; but less so than the chesnuts; the poplars, very little so. Near the mulberry tree, the corn was covered by its shade for a long time every morning; and, though not se large as that which had more sun, maintained a healthy appearance."

The shade of the black eak is particularly hurtful to the growth of wheat; that of the locust is, on the contrary, beneficial to grass-grounds; and that of the sugar-maple does but little injury to the growth of grain, and none to grass .- Farmer's Assistant.

HILLS AND VALLEYS.

It is found that more rain falls in the valleys than on the hills. The reason of this is, that in the valleys the drops of rain having farther to fall, of, that vapor with which even the driest atmosphere abounds.

If a geblet filled with cold water he set in a to its sides in the form of water; and in the same wine!" These tegether with the great quantity

In this, as in everything else, the wisdom of the Creator is displayed. The temperature of the valleys being warmer than that of the hills, more moisture is required and more is given them. Hence, too, the reason why many plants, which require much heat, grow best in valleys : diey have the requisite degree of heat, and at the same time a preportionate degree of moisture. But as all grasses which are indigenous require only the heat of the hills, they grow as well on them as in the valleys: a good general rule, therefore, is, the valleys for tillage, and the hills for pastures.

Two other good reasons for this are: Firstly, when hills are kept in tillage, they are generally more or less washed by the heavy rains, by which much of the best soil is carried off; and secondly, they are always more or less inconvenient for ploughing, and generally still more difficult for pasture, adds much to the beauty of a landscape; carrying any heavy manures upon them. The above rule, however, is not to be applied to hills of large extent and moderate descent; it is, in strictness, merely applicable to broken hills and declivities .- Farmer's Assistant.

NEW ENGLAND FARMER.

BOSTON, FRIDAY DEC. 26, 1828.

ON THE PRESERVATION AND REPAIR OF ROADS.

A friend, who resides in Maine, has requested us to republish from Loudon's Encyclopedia of Agriculture, an article on the use of broad wheels in carriages, for preserving roads much travelled on. This we do with much pleasure, as we know of few subjects of more general interest.

The preservation of a road depends in a great measure on the description of machines and animals which pass over it, and of keeping it dry and free from dust and mud. The repairs of a road should commence immediately after it is finished, and consist in obliterating vats the moment they appear, filling up any bollows, breaking any leese stones, and correcting any other defect .-After cleaning and this sort of repair have gone en hand in hand, for a longer or shorter period, according to the nature of the materials, and traffic of the road, a thorough repair or surface-renewal may be wanted, of three or more inches in thickness, over the whole of the read. [Some remarks on Broad Wheels in our next.

FOR THE NEW ENGLAND PARMER.

DOMESTIC COOKERY.

MR FESSENDEN-I am a constant reader of your excellent paper, and often see articles of a tendency to suppress intemperance. This is as it should be; but there is a kind of intemperance to which I would call your attention-viz. Introducing ardent spirits into domestic cookery. I have been a house keeper for nearly thirty years, and can say with confidence, from my own experience, there is not the least need of using spirits in any kind of cooking. Intemperate eating is said to be as hurtful as intemperate drinking. No wonof course come in contact with, and absorb more der, when, in addition to high seasoning, is often quantity of light, by one fourth, than a pound of added large quantities of brandy and wine. It is six to the pound; because the tallow is more perno uncommon thing to see, in a receipt, for in- fectly consumed, in consequence of a greater surstance, for making mince pie, "to one pound of face of wick being exposed to the air. In large warm atmosphere, this vapor will presently adhere | meat add one quart of brandy, and, one quart of wicks the tallow is not burned, but distilled away.

way it adheres to the drops of water in their de- of spices, &c, are enough to destroy the tone of almost any stemach. How often do we hear people say, "I can't eat any mince pie-my stomach wont bear it,"-whereas, if properly made, almost any stomach could bear it. It would be nutritions, innocent. I hope while there are improvements making so universally, this important branch of domestic economy, and I may add, domestic temperance, will not be neglected.

Keene, N. H. Dec. 23, 1828. A MOTHER.

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN-I noticed in one of your numbers last summer, a description of a method of telling a horse's age, which I did not thoroughly understand; and I should be grateful to any person who would explain it a little more satisfactorily. I am happy to find that the horses sent here by Admiral Coffin have met with the favor they deserve. Some time in the next spring, I will endeavor to give a very short, but more complete account of the causes of foot-lameness; and to rectify any mistakes I may perceive in my previous communication. I am surprised to find that I omitted high feeding as one of its exciting causes. However, I did not intend to give much more than an account of what is now conceived to be the disease.

J. L. ELWYN. Portsmouth, N. H.

FATTENING CALVES.

In order to make calves fine and fat, the best and most efficacious way is, to keep them as clean as possible, by elevating the coops in such a manner that the sun may not have too great power over them, and to such a height above the level of the ground, that their urine may pass off; by giving them fresh litter every day, and suspending over the coop a large chalk-stone, so that they can easily lick it. Besides this, it is usual to bleed them when they are about a month old, and again just before they are slaughtered; which practice contributes in a considerable degree to the beauty and whiteness of the flesh, and is therefore more frequently repeated by some persons, [in England] but this is not altogether necessary; twice bleeding being fully sufficient for that purpose, in the opinion of the most experienced breeders. It is however, to be observed that those calves, which are intended for bulls, or for oxen, should be selected as soon as possible; as the operation necessary to make them oxen should not be deferred till the calves are more than twenty days old. Willieh.

CANDLES.

When tallow is very dirty or rancid, an ounce of pearl ash to about ten pounds of tallow, put into the water wherein the tallow is melted, is of service. In such candlesticks as are not made to slide. the candles are frequently permitted to burn in the socket, to great waste, and to the injury of the candlestick. This may be prevented by taking out early the short piece of candle, placing it between three common pins, stuck in an old cork, and putting the cork in the candlestick. A pound of candles, ten to the pound, will give a greater Cooper.

DEEP PLOUGHING.

Deep ploughing may be a very profitable prac-'ice in a rich soil; and in a tertile, shallow soil, situated upon cold clay or sandy subsoil it may De extremely prejudicial. A shallow soil, however, may be rendered deeper by degrees, ploughng up a small quantity of barren earth at a time, and manuring plentifully.

FOOD FOR PLANTS.

Water, and the decomposing animal and vegetable matter existing in the soil, constitute the true nourishment of plants; and as the earthy parts of the soil are useful in retaining water, so as to supply it in the proper proportions to the roots of the vegetables, so they are likewise efficacious in producing the proper distribution of the animal or vegetable matter; when equally mixed with it they prevent it from decomposing too rapidly; and by their means the soluble parts are supplied in proper proportions.

SOILS ABSORBING MOISTURE.

I have compared the absorbent powers of many soils with respect to atmospheric moisture, and I have always found it greatest in the most fertile soils; so that it affords one method of judging of the productiveness of land .- Agricultural Chemistry.

POTATOES IMPORTED.

In 1827, 20,892 bushels of potatoes were imported into the United States from the British dominions; but the exports of American potatoes in that year to England and her dependencies were only two bushels. This, however, is the less to be wondered at, when we reflect that the climate of Great Britain, Ireland, Canada, and Nova Scotia, being more moist and cool than that of the United States, is better adapted to the culture of potatoes.

NICETY IN MAKING CIDER.

An English writer says, "In some places apples are split, and two kinds of eider made; that with the red side being of a superior quality to what the whole apple would make."

TO MAKE VERY STRONG VINEGAR.

An European author asserts that, "Cider (particularly such as is of an acid tendency,) placed in the sun, becomes vinegar in a short time; and one pound of honey to a gallon of a large quantity of potash. cider will, after standing some months, become such strong vinegar that it must be mixed with lamps: swine are fond of them, but their fat is water for common use."

ENTOMOLOGY.

A new animal or plant is seldom to be met with, even by those who have leisure and opportunity poor for winter firing. The tree bears lopping, for extensive researches; but if you collect in- and may be trained to form very lofty hedges. sects, you will find, however limited the manor Gleanings on Husbandry. upon which you can pursue your game, that your efforts are rewarded by the capture of some nondescript or rarity at present not possessed by other muriat of iron, sufficient to cure any number of entomologists, for I have seldom seen a cabinet so meagre as not to possess unique specimens. Nay, though you may have scarched every spot in your times a day, for two or three weeks, with the neighborhood this year, turned over every stone, feather of a quill made very small at the end, so shaken every bush or tree, and fished every pool, as to discharge a drop at a time, and let it dry in. you will not have exhausted its insect productions. If the wart should be an old one, it would be more Do the same to another and another, and new treasures will still continue to enrich your cabinet. knife a little of the rough outside skin, not, how-If you leave your own vicinity for an entomolo- ever, so as to make it bleed, but just sufficient to gict l excursion, your prospects of success are still make the surface a little tender.—Am. Sentinel.

farther increased; and even if confined in bad weather to your inn, the windows of your apartment, as I have often experienced, will add to your stock. If a sudden shower obliges you at any time to seek shelter onder a tree, your attention will be attracted, and the tedium of our station relieved, where the botanist could not hope to find even a new lichen or moss, by the appearance of several insects, driven there, perhaps by the same cause as yourself, that you have not observed before. Should you, as I trust you will, feel a desire to attend to the manners and economy of insects, and become ambitious of making discoveries in this part of entomological science. I can assure you from long experience, that you will here find an inexhaustible fund of novelty. For more than twenty years my attention has been directed to them, and during most of my summer walks my eyes have been employed in observing their ways yet I can say with truth, that so far from having exhausted the subject, within the last six months I have witnessed more interesting facts respecting their history, than in many preceding years. To follow only the insects that frequent your own garden, from their first to their last state, and to trace all their proceedings, would supply an interesting amusement for the remainder of your life, and at its close you would leave much to be done by your successor; for where we know thoroughly the history of one insect, there are bundreds concerning which we have ascertained little besides the bare fact of their existence.

Kirby & Spence.

USES OF THE BEECH TREE.

The leaves of the Beech, gathered in autumn, before they are much injured by the frost, make infinitely better mattresses than straw or chaff, and endure for seven or eight years. It is unparalleled in water works, for when constantly kept wet, it appears as perfectly sound at 40 years end, as when first immersed. [It rots very quick, however, in fences, or other situations in which it is exposed to changes from wet to dry.]

The wood is formed into tool-handles, planes, chairs, bedsteads, spokes, bowls, large screws, &c. The fellocs of the London carts are made of

it, because it tears with more difficulty than even

It is excellent fuel, and when burnt it affords

The mast, seeds or nuts yield a good oil for soft, and hoils away, unless hardened before they are killed, by some other food. They have been toasted as a succedaneum for coffee.

The hulls of the seeds are collected by the

Cure for Warts .- Procure sixpence worth of warts, which may be had of any of the druggists, and touch the wart with the liquid three or four speedily cured by shaving off with a sharp penSTATISTICS.

In the notice of the work of M. Balbi, called The Political Balance of the Globe," which we find in the Journal des Debats of the 27th September, the following tables are extracted, purporting to show the power and resources of the principal nations of the civilized world, as compared with their respective population:

Proportion between the amount of Revenue and Population.

United Kingdom of Great Britain and Ireland, for each inhabitant, about \$13 00

Netherlands, - - - - - - Prussian Monarchy, - - -5 1.5 3 1.2 United States of America, 2 2-5 Empire of Austria, -2 1-10 Empire of Russia, excluding Poland,

Proportion between the amount of Debt and Population.

United Kingdom of Great Britain and Ireland, for each inhabitant, about \$174 00 Netherlands, - - -127 00 29 00 France,

9 00 Austria, United States of America, 7 00 Prussia, 5 9-10 Russia, excluding Poland, 4 1-12

Proportion between the Army and the Population. Inhabitants.

Russia, without Poland, one soldier for every 57 Prussia, 80 Austria, 118 France, 138 Netherlands, 142 229 Great Britain and Ireland, United States of America, 1977

Proportion of the Naval Force to the Population.

Inhabitants. Great Britain and Ireland, one line of 82,979 battle ship or frigate, to -Sweden and Norway, 154,640 Netherlands, -170,566 France, 299,909 United States of America, 316,000 Russia, without Poland, 700,000 Austria. 2,909,091

This is a curious, and not uninteresting view of the various powers enumerated; and if the same accuracy be evinced with regard to the other calculations, which is exhibited in those relating to the United States, it must be deemed authentic.

From the United States Gazette.

COMMUNICATION.

Gentlemen-Herewith I send you an extract from late English papers, which may be interesting to some of your readers, and which you can publish when you have room for it.

A Coffee Drinker!

Coffee.-The discovery of coffee is generally attributed to the Prior of a monastery in that part of Arabia where the shrub is indigenous .--The fact of the case, however, as verified by the learned Addalcuder, whose manuscript is in the King of France's library, and by Mr Galland, translator of the Arabian Tales, are as follows :--

About the middle of the fifteenth century, one Gemaleddin, who resided at Aden near the

mouth of the Red sea, having occasion to travel into Persia found there some of his countrymen, who were in the habit of taking coffee, and who were loud in the praise of its virtues. On his return to Aden, he was cured from sickness by the use of coffee. As Musti of Aden, and having occasion to pass whole nights in prayer, Gemaleddin persuaded the Dervishes, the better to fit them for watching, to make use of coffee. In a short time there was no beverage in Aden, so popular as coffee; lawyers took it to stimulate their faculties; mechanics and artists to invigorate their bodies; travellers to aid them to prosecute their journey by night; in short, all Aden took it. From Aden it passed to Mecca, where it became in a short time, if possible, still more popular. From Arabia Felix it was carried into Egypt, thence to Syria, and finally to Constantinople.

BRIGHTON CATTLE MARKET.

We have received from an obliging correspondent, the following view of this great market, from the 29th September, to the 1st December.

	SOLD	AT BRIGI	IITON.

21,546 Cattle, average value \$25 each, \$538,953 39,391 Sheep, 66 \$1,50 do. 59.746 \$4,00 do. 28,508 8,127 Swine,

68,504 Total. 626,904

Our correspondent adds,-"The cattle have been unusually large and good, exceeding that of any former season. The sales for the best cattle have been dull, in consequence of the large number in the market. Barreling cattle have commanded better prices than for some years past."-Bost. Cent.

We have received a sample of sugar, refined in London, from the maple sugar of Canada. It is certainly equal to any of the refined sugar imported for sale into this country. We have not the means of ascertaining what quantity of maple sugar is manufactured annually in this province, but we have reason to believe it s considerable .- York, U. C. paper.

We have been shown the prospectus of a plan for forming an association to be called the 'Erie and Ontario Transportation Company,' with a capital of \$130,000, for effecting the transportation of produce and merchandize from any designated port on lake Eric, through the Welland Canal, to Prescott, and from thence to Montreal, or to Oswego, and from thence to New Yorkand vice versa .- ib.

Such is the mildness of the season to the South, that Okra was in blossom on the 4th of Dec. in several gardens in Charleston.

A specimen of the growth of native Ginger, has been left with us by Mr Raiford, who has raised it successfully for four years past, on common land, and exposed to all the variations of our climate. That in our office, was planted in February last, is now in full vigor and luxuriance, and in a few weeks will ripen. From several experiments made in its culture on a small scale, it might, it is thought, be made a profitable article, considering the demand for ers much finer than any he had seen cultivated in this country. it .- Savannah Georgian.

Mr Josenu W. CAPRON, of Attleborough, raised the last season, from 130 square rods of land, 75 bushels Potatoes and 20 bushels Indian Corn. A small orchard on the same laud yielded between 30 and 40 bushels apples.

We are informed that Col J. Hare Powell. of Pennsylvania, has sent by the ship Helen Mar, Capt. Harrison, a young Bull, from a full bred Chinese cow, by a celebrated Durham short horn. This valuable animal is considered to be particularly well adapted to endure a Southern climate, and has been presented to Dr Tidyman by that distinguished and zealous agriculturist, Col. Powell, who has evinced more liberality in benefiting the cause of agriculture, than any individual in the United States. The public are much indebted to this gentleman for the persevering and successful effort he has made to promote the breed of cattle and sheep. We have reason to rejoice at the continued improvements which are making in every branch of agriculture through the United States .- Char. Cour.

Oil stone.-This valuable stone, of a quality superior to the Turkish Oil Stone, bas been discovered in Hocking county, Ohio.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissus, Gladiolus, Snow Drops, Crocus, Star of Bethlehem, Jonquilles, Racunculus, Iris, Crawn Imperials, Anemoues, Crocus, &c. from 12 tn 62 ets. each. A very lew of the figest Hyacinths, dark and pale hlue, pure white, red, yellow, and white with various eyes, at \$1 per root.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the West Indies, can be furnished with boxes of Seeds, assurted, suitable for that market, at from \$4 to \$5 per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.— Likewise the greatest variety of seeds to be found in New England, by the pound or bushel, all warranted pure, and of the growth of 1827.

Field Peas.

A consignment of 50 bushels of Field Peas, from Vermont. of the growth of 1827, in good order. They will be sold by the tierce at \$1.75 per bushel.

Oat Meal, &c.

Fine Oat meal and Oat Flour, Hulled Oats, Hulled Barley, Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shruhs, &c. ror sale, a variety of Seeds of Forest Irees, Strons, &C.
mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts. a paper. They
were gathered by a gentleman familiarly acquainted with the
sorts, expressly for us. They will be sold by the single paper,
or packed to order, in any quantity.
Also, Pench and Almood Stones, and many other valuable Fruit
ACP. The Seeds of the past which of the gentlemes of which

and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, 'Tree and Herb Seeds to be found in New England, at wholesale and retail. The Seeds are all raised in this vicinity expressly for this Establishment, by careful and experienced growers, and are warranted pure and fresti. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphic catalogue (24 edition) of our Seeds, Trees, &c. is published and will be forwarded gratis to any one who will send for it.

Orchard Grass Seed.

A few more bushels of this valuable Grass Seed, growth of 1828. Also, Lucerne, White Clover, Fowl Meadow, and every

other kind of Grass cultivated in New England. White Mulberry Seed.

This day received, a few pounds of warranted genuine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for use—For sale by the b. or unner. Shallots for fall planting. Tree and Potaco Omens.

Tangter Caulifloner.

We have just received through Mr Malony, the American Consul at Tangier, a few lbs. of this celebrated Caulifluwer seed. A small parcel was sent to the Hon, Jonathan Hunewell of this city, a few years since, who pronounces it altegether su-perier to any seed from Eugland, and which produced cauliflow-responds fower than any he had seen culturated in the Thorn Quicks for Hedges.

A few thousand Buckthorns and Hawthorns. The latter were imported from Glasgow last spring, and are in fine order for transplanting, \$5.00 per thousand, 75 cents per lundred. We are now filling up an order for Georgetown, (D. C.) for several thousands of the American Thorn, which will be delivered bere at \$5 per thousand of for seedlings; \$6 for plants two years old. Persons in want of this valuable thorn for live hedges are desired to transmit their orders soon. A few thousand Buckthorns and Hawthorns. The latter were

Roots of the Pie-Plant, or Tart Rhubarb.

Roots of the res-Plant, or Fart Intubarb.

A large supply of the roots of the Rheum Undulatum, or Tart Rhubarb, or Pic-Plant, an excellent article for summer use.

(See N. E. Farmer, vol. vi., page 200, and page II of this volume, and Pessenden's New American Gardener, article Rhubarb, for its culture and uses). The roots are in fine order for transplanting this fall. Price 25 ets, per root view of the price 25 ets, per root view and price when the price 25 ets, per root view of the per root view of the price 25 ets, per root view of the price 25 ets, per root view of the price 25 ets, per root view of the per root vi

Seed Potatos.

A few bushels La Plata or Long Red Polatos, raised by Mr Gourgas of Weston; selected for seed, of a uniform size, and mr dispersed as so their earliness, by the careful attention of Mr G. For sale at the

New England Farmer Seed Store, No. 52 North Market, Street-Boston.

MISCELLANIES.

Egotism .- Those people who have nothing else in them are, generally, full of themselves.

A good man is a useful man.—The blessings of education, wealth, rank, leisure, authority, and reputation, are granted to a few, that they may employ them for the good of the whole community; so that those who labor may have no cause to reproach those who do not work with their hands for being drones, and a useless burthen to the community.

Responsibility of men of talents .- When a talent is given to any one, an account is opened with the great Giver, who appoints a day in which he will arrive and redemand his own with usury.

Success and its consequences .-- Prosperity, which hardens weak souls, softens generous hearts; and nothing can be more gentle than a hero after victory.

Poverty and Knavery.—The poorer a man is, the more necessity there is for his being honest. A rich knave may, perhaps, prosper for a time in worldly affairs; but a poor knave will soon have as little credit as cash, and will not only suffer but deserve all the evils, which poverty can inflict.

A queer mistake. - When the late Admiral Crosby was dining with Col. Fitzgerald, at Merriansquare, London, he happened to lay his huge brown fist upon the table; at that momen. Dr Jenkins, who was very short sighted, casting his eyes around the table in search of a loaf of bread, happened to rest them on the Admiral's fist; and mistaking it for a loaf, thrust his fork plump into it. The Admiral smarting with the wound, said in a rage, "do n't trouble yourself to reach-I'll help you," and raised the same fist to demolish the doctor. The doctor perceiving his mistake, cried out, "only a slice, sir, it wont go/round." This disarmed the Admiral of his wrath, and so convulsed the company with laughter, that, all the dyspeptick cases at table were discontinued.

Fontenelle. - At the close of a fine summer's day, Fontenelle was discovered by a friend reclining on the sunny side of a hill, contemplating a flock of sheep, which, anxious for the arrival of their shepherd, kept bleating. "Why so melancholy, sir?" inquired his friend, "ruminating, no doubt, on human vicissitudes and ------." "You are very right," said the amiable philosopher, interrupting him; "I am examining that noisy flock before us, and I am just saying to myself-that among them 200 sheep, it is very probable there is not to be found one tender shoulder of mutton!" -London Weekly Review.

Cobbett on Early Education .- " I have just now put my French Grammar into the hands of my youngest son, who is 14 years and a half old-that being about the age that I think it best for boys to begin to read books; and as to girls, they will always begin soon enough, if you suffer any books to be in the house. I have no opinion of settling little creatures down to pore over printed letters, before it is possible for them to understand any reason which you give for anything. The first thing in my mind, is to do your best to cause them to have healthy bodies; then, as soon as they can America at Lyons and St Etienne.

reason, they will have sound minds, learn anything you put before them, and they will, in a trice, overtake the little masters that have been perched upon a form from three years old to fourteen."

In 1697, the corporation of New York ordered lights to be placed in their windows, during the dark time of the moon. At this time, the city contained 6000 inhabitants, 600 of whom depended upon bolting for a living. At a subsequent period, in the same year, it was ordered that every seventh house hang out a pole with a lantern, to light the streets.

In 1757, Staten Island was sold by the Indians to the Dutch, for 10 shirts, 20 pairs of stockings, 10 guns, 30 bars lead, 30 lbs. powder, 12 coats, 2 pieces duffil, 30 kettles, 50 hatchets, 25 hoes, and a number of knives and awls .-Two years after, the Indians complained that the terms of the sale had not been complied with, and the Dutch were obliged to add more trinkets, when the island was formally delivered to Thomas Lovelace and Mathias Nichols .- New York Gazette.

The Catskill Republican of the 26th ult. says that more than three thousand firkins of butter, made principally in Delaware county, came into that village in one day. Schoharie has sent a vast quantity of wheat this season, to the same place. Toast, we imagine, will be plenty in Catskill this year. Will old Berkshire send them some choese to eat with it?

"A Salt River Roarer."-One of those twofisted back-woodsmen, "half horse, half alligater, and a little touch of the snapping turtle, went lately to see a caravan of wild beasts. After giving them a careful examination, "he offered to bet the owner," says the Western Mer-cury, "that he could whip his lion in an open ring; and he might throw in all his monkeys; and let the zebra kick him occasionally during the fight!"

Indigo .- It is proposed to revive the cultivation of Indigo in Florida. Formerly much was produced there, which was only rivalled by that of the Caraccas. In former times, nearly \$180,000 were paid in London, in one year for Florida Indigo.

The first Paper Mill in England, was erected at Dartfort, by a German, in 1588, who was knighted by Elizabeth; but it was not before 1713, that a stationer, one Thomas Wathers, brought the art of paper making to any perfec-

A nectarine scion, inserted in a peach stock, on the farm of Mr W. Elliot, of Northford, Conn. grew five feet six inches the last season, handsomely proportioned, with fine thrifty branches.

Old proverb .- " He who whistles much has an empty head."

We learn, says the Williamstown Advocate, that all the merchants in six towns in Berkshire county, have determined to retail no more ardent spirit.

Large orders for silks have been received from

Cobbett .- This extraordinary man alluding to the number of his "works," observes-If any young man wish to know the grand secret relative to the performance of such wongrous labor, it is told him in a few words-be abstinent-be soher -go to bed at eight o'clock and get up at fourthe last two being of still more importance than the two former. A full half of all that I have ever written, has been written before ten o'clock in the day; so that I have had as much leisure as any man I ever knew any thing of. If young men will but set about the thing in earnest, let them not fear of success; they will soon find that it is disagreeable to set up, or to rise late. Literary coxcombs talk of "consuming the midnight oil." No oil, and a very small portion of candles, have I ever consumed, and I am quite convinced, that no writing is so good as that which comes from under the light of the sun.

The merchants in Boston have come to a resolution to decline in future to give a discharge to their debtors, either in Boston or in the country, for less than one hundred cents on a dollar, in case of loss by fire, unless their property is insured to near the amount of its value.

A new State Prison, in the vicinity of Westchester, N. Y. has just been completed. It is built of white marble, is 4821 feet long, 44 broad, 4 stories high, and contains 800 cells.

From the year 1821 to 1825 inclusive, the value of silk goods imported into the U. States, was upwards of thirtyfive millions of dollars. Nothing is wanting but proper attention paid to the subject to enable the inhabitants of the U. States not only to supply domestic consumption with this costly article, but to export it.

SUBSCRIPTION

For importing Grape Vine Roots from France, at a moderate price, and encouraging the introduction of that culture into the United States.

Mr Alphonse Loubat, having considerably enlarged his Vineyard, on Long Island, where he now has, in full cultivation, thirty-five acres of ground, containing 72,000 Grape Vine Roots; having also the peculiar advantage of being enabled to procure the best specimens of roots from his father's extensive vineyards and nurseries, in the districts of Bordelais, Clerac, and Buzet, departments of Gironde and Lot and Garonne, in France, (45° N. Lat.) proposes to the numerous friends to the

cultivation of the grape vine in the United States, a subscription will be opened on the first of August, 1829.

Mr A. L. will engage to furnish subscribers with the Grape Vine Roots, before the first of March next, and forward them Vine Roots, before the first of March next, and forward them free of expense, to the different cities where subscription lists shall have been opposed. The roots will be three years old, and yill produce considerable truit the second year from the time of their being planted. They will be carefully classed and packed in boxes, with some of the original soil in which they have been raised, which will greatly facilitate the thriving of the roots, whose transplanted. when transplanted.

raised, when wing reasy seemage the tarring of the swhen transplanted.

Orders will be punctually attended to: the subscribers designating the quantities and species of the grape vine roots they wish to have. The py vill engage to pay for 1000 roots or more, the rate of 15 cents; and 25 cents per 10 for less than 0.6 c.

Roots only two years old, shall be paid for at the rate of 9 cents each, for 10 or more; 12 1-2 cents for less than oue 100 5; and 18 cents for less than oue 100 5; and 18 cents for less than 50 roots. Payment to be made on delivery of the roots. Letters not received unless post paid.

Subscription lists are open at New York, with Alphonse Londa, 55 will street; Boston, E. Copeland, Jr.—Albany, R. M'Michael—Philadelphia, Van Amringe—Ballimore, Willard Rhoads—Washington City, W.m. Pairo, Richmond, Davenport, Allen & Co. Savaonah, Hall, Shapter & Tupper—New Orleans, Foster & Hotton Charleston, 18, C. J.) & J. Street Co. Mr A. Loubat's book on the Culture of the Grape Vine, and on the Making of Wine, may be found at the principal book.

and on the Making of Wine, may be found at the principal book-sellers of the United States; and his agents will furnish them gratis to subscribers.

left little to be desired in that branch of rural riculturists in Europe. economy. Among other publications of distinguish-ed merit, on agricultural topics, may be number-and subdivided by hedges or other fences. Some Dr R. W. Dickson, &c. &c. The names of which are established throughout all France. Kaimes, Anderson, Sinclair, are also rendered il- Since the time of Colbert the French have paid philosophical sagacity, and patient experiment, resulting in improvements of incalculable imporof John London, F. L. S. II. S. whose elaborate and able works, entitled Encyclopedia of Gardening and Encyclopedia of Agriculture, have probably never been surpassed by any similar works in any language, age, or country.

The establishment of a National Board of Agriculture was of pre-eminent service to British husbandry. Hartlib, a century before, and Lord Kaimes, in his Gentleman Farmer, had pointed out the utility of such an establishment, but it was left to Sir John Sinclair to carry their ideas into execution. To the indefatigable exertions of that worthy and eminent character the British public are indebted for an institution, whose services can hardly be sufficiently appreciated. "It made farmers who reside in different parts of the kingdom acquainted with one another; and caused a rapid dissemination of knowledge amongst the whole profession. The art of agriculture was brought into fashion; old practices were amended, new ones introduced, and a degree of exertion manifested, which had never before been exemplified in this island."

AGRICULTURE OF FRANCE.

French agriculture began to flourish in the be-

agricultural societies established in France, and low, and cultivated like a plantation of rasphernineteen co-operating societies. Those of Paris, ries. The white mulberry tree is very extensive-Written for the Conversation-Lexicon, by the Editor of the Amiens, and Bourdeaux have distinguished them- by cultivated for feeding the silk-worm. It is not solves by their published memoirs. Du Hamel placed in regular plantations, but in corners, rows, and Buffon caused the study of rural economy to After the time of Tull's publication, no great al- become fashionable, and other writers contributed teration in British agriculture took place, till Rob- to the advancement of husbandry. M. de Truert Bakewell and others carried into effect some daine introduced the Merino breed of sheep in important improvements in the breeds of cattle. 1776, and Comte Lasteyrie has written a valuasheep, and swine. These resulted in great bene-ble work on sheep-husbandry. The celebrated fits to British agriculture and emolument as well Arthur Young made an agricultural survey of as fame to those who effected the alteration. By France in 1787, 8, and 9. Since that time sev-Bakewell's skilful selection at first, and constant eral French and English writers have given the care afterwards to breed from the best animals, statistics and culture of different districts, and the he at last obtained a variety of sheep, which, for Abbe Rosier and Professor Thouin general views early maturity, and the property of returning a of the whole kingdom. Buonaparte established great produce of mutton for the food, which they many new agricultural societies and professorconsume, as well as the small proportion, which ships, botanie and economical gardens for the exthe weight of the offal bears to the four quarters, hibition of different modes of culture, and the diswere without precedent. Culley, Cline, Lord semination of plants. He also greatly enlarged Somerville, Sir J. S. Sebright, Darwin, Hunt, and enriched that extensive institution, the Nature Venue for Scalars. Hunter, Young, &c. &c. have all contributed to tional Garden, whose Professor of culture, the the improvement of domestic animals, and have Chevalier Thouin, is one of the most scientific ag-

ed The Farmer's Letters, Tour in France, Annals fences occur near towns, but, in general the whole of Agriculture, &c. &c. by the celebrated Arthur country is open; the boundaries of estates being Young ; Marchall's numerous and excellent works, marked by slight ditches or ridges, with occasioncommenced with Minutes of Agriculture, published al stones or heaps of earth, rows of trees or scatin 1787, and ended with his Review of the Agricul tering trees. lustrious by publications, which exhibit a union of a good share of attention to sheep, and there are considerable flocks of Merino sheep owned by individuals, besides the national flocks. That of tance not only to the British nation but to the hu-Rambouillet, established in 1786, is, or lately has man race. To these we shall only add the name been managed by M. Tessier, an eminent writer on agriculture. Sheep are generally housed, or kept in folds, and little yards and enclosures.

Mr Birkbeck considers the practice of housing or confining sheep as the cause of foot rot, a disease very common among sheep in France .-Where flocks remain out all night, the shepherd sleeps in a small thatched but, or portable ware house, placed on wheels. He guides the flock by walking before them, and his dog guards the sheep from wolves, which still abound in some the ass, and the mule are of frequent use in husbandry. A royal stud of Arabian horses has been kept up at Aurillac, in Limousin, for more than established near Nismes. Poultry is an importhinks that the consumption of poultry in towns may be equal to that of mutton. The breed of swine is, in general, bad; but fine hams are made in Bretagne from hogs reared on acorns, and fatted with Indian corn. The French implements of agriculture are generally rude and unwieldly, and the operations of husbandry unskilfully performed.

The vine is cultivated in France in fields, and ginning of the seventeenth century, under Henry on terraced hills, but managed differently in that IV. and a work on that subject was published by country from its common culture. In France one-fifth of the surface of Italy is considered ster-

Olivier de Serres. In 1761 there were thirteen vines are planted in hills, like Indian corn, kept by the sides of roads, &c. The trees are raised from seeds in nurseries, and sold, generally, at five years' growth, when they have strong stems, They are planted, staked, and treated as pollards.

The eggs of the silk worm are hatched in rooms, by means of stoves to 180 of Reaumur (721 Fah.) One ounce of eggs requires one hundred weight of leaves, and will produce from seven to nine pounds of raw silk. The hatching commences about the end of April, and with the feeding is over in about a month. Second broods are procured in some places. The silk is wound off' the cocoons in little balls by women and children. The plive, the fig, the almond, and various other fruits are also extensively cultivated in

LAGRICULTURE IN GERMANT.

The earliest German writer on husbandry, was Conradus Heresbachius, who lived and died in the 16th century. His work De Re Rustica was an avowed compilation from all the authors who had preceded him. No other books on agriculture of any note appeared previous to the seventeenth century. With regard to the present state of agriculture in Germany, we are necessarily limited to brief notices. The country is very extensive and precent agreed variety as respects soil, surface, climate, and culture. Its agricultural preduce is, for the most part, consumed within its limits, but excellent wines are exported from Hungary and the Rhine, together with flax, hams, geese, silk, &c. The culture of the mulberry, and the rearing of the silk worm is carried on as far north as Berlin. The theoretical agriculturists are well acquainted with all the improved implements of Great Britain, and some of them have been introduced, especially in Holstein, Hanover, and Westphalia; but, in general, their ploughs, wagons, &c. are unhandy, unwieldy, and inefficient. Fish are carefully bred and fattened in some places, especially in Prussia, and poultry is every where attended to and carried to a high degree of luxury at Vienna. The culture of forests likewise receives particular attention in that country as well as in France. The common agparts of the country. In the south part of France, riculture of Germany is every where in a state of improvement. Government, as well as individuals have formed institutions for the instructions of youth in its principles and most enlightened praca century, and another has been more recently tices. The Imperial Society of Vienna, the Georgical Institution at Presburg, and that of Professor tant article in French husbandry. Mr Birkbeck Thaer, in Prussia, may be numbered among recent institutions of this description.

AGRICULTURE IN ITALY.

The climate, soil, and surface of Italy are so various as to have given rise to a greater diversity of culture than is to be found in the whole of Europe, besides. Corn, grass, butcher's meat, cheese, butter, rice, silk, cotton, wine, oil, and fruits of all kinds, are all found in perfection in this fertile section of the globe. Loudon asserts that only ile, while only a fifth of the surface of France is The population of Italy is considered fertile. greater in proportion to its surface than that of either France or Great Britain.

Arthur Young, in 1788, Sigismondi, in 1801, and

Chateauvieux, in 1812.

In Lombardy, the lands are generally farmed by metayers, (from meta one half). The landlord pays the taxes and repairs the buildings. The tenant provides cattle, implements and seeds, and the produce is divided. The irrigation of lands in Lombardy is a remarkable feature of Italian husbandry. All canals taken from rivers are the property of the state, and may be carried through any man's land, provided they do not pass through a garden, or within a certain distance of a mansion, on paying the value of the ground occupied. Water is not only employed for grass-lands, which, when fully watered, are mowed four, and sometimes five times a year; and in some cases as early as March, but is conducted between the narrow ridges of corn lands, in the hollows between drilled crops, among vines, or to flood lands, a foot or more in depth, which are sown with rice. Water is also used for depositing a surface mud in some places where it is charged with that material. The details of watering for these and other purposes are given in various works, and collected in those of Professor Re. In general, watered lands let at one third higher price than those not irrigated.

The implements and operations of agriculture in Lombardy, are both very imperfect. plough is a very rude contrivance, with a handle thirteen or fourteen feet long. But the cattle are fed with extraordinary care. They are tied up in stalls, then bled once or twice, cleaned and rubbed with oil; afterwards combed and brushed twice a day. Their food in summer is clover or other green herbage; in winter a mixture of elmleaves, clover-hay, and pulverized walnut-cake, over which boiling water is poured, and bran and salt added. In a short time the cattle cast their hair, grow smooth, round and fat, and so improved as to double their value to the butcher.

The tomato or love-apple (solanum lycopersicum) so extensively used in Italian cookery, forms an article of field culture near Pompeii, and especially in Sicily, from whence they are sent to Naples, Rome, and several towns on the Mediterranean (To be continued.)

Williams, in his book on West Florida, remarks of the cultivation of Indigo in that country, that Caracas, alone was able to rival Florida, in this article; forty thousand pounds sterling in one year, has been paid in London, for Florida Indigo: yet at this time not a pound is raised in the territory for sale; a few planters cultivate it for the use of their families; yet it is raised with less trouble than any other crop, and any female slave can manufacture it. This plant also is a native of Florida; its natural soil is the Pine Barrens.

Sheep .- A meeting of the citizens of Orange county has been called at Goshen, N. Y. to devise some plan to protect their sheepfolds from the ravages of dogs, the existing laws being insufficient.

Ginger Root .- Mr Raiford, near Savannah, has raised ginger root for the last four years, successfully, on common land, and exposed to all the variations of the climate.

FOR THE NEW ENGLAND FARMER.

INSECTS ON FRUIT TREES.

Ma Fessenden-Your Pennsylvania corres-The writers on the rural economy of Italy, are pandent, M, appears to have noticed two distinct insects on the apple-tree, one of which, as Mr Buel size and shape of a small grain of coffee, with a ican blight, ERIOSOMA mali of Leach, APHIS Lanata or lanigera of other naturalists.

The account given by M. was not sufficiently detailed and particular to enable us to decide which of these two latter insects his probably was. although it appeared most to resemble the barklouse of Mr Perley.

It has not yet been ascertained whether our

Perhaps a few general remarks on the œconomy of the Coccus genus may not be unacceptable to some of your readers, and may stimulate them to complete, by careful observation, the history of Mr Perley's species.

Early in the spring the Cocci are found apparently torpid, situated longitudinally in regard to the branch, the head upwards, and sticking by their flattened inferior surface closely to the bark. On attempting to remove them they are generally crushed, and there issues from the body a dark colored fluid. By piercing them with a pin they

* We intended, however, to make our remarks applicable to two distinct species of insects. One which was described by "M" as having an appearance which "resembled the blossoms "M" as having an appearance which "resembled the blossoms of timothy or some small grass, shaken on the trunk of the tree, when wet with dew, and remaining on it.—After which they appeared to increase in size to about the higness of shot No. 8 cut in two and a fittle lengthened; and formed a cover, adhering to the bark, under which the insect, whatever it may be was found," &c. [See p. 142]. This we supposed might be the bark-louse of Mr Perley; but having doubts on the subject, after describing the Perley insect, we remarked: "The abave description of a destructive insect, and the remedy prescribed by Mr Perley may be of use, although the insect purp the but we the supposed may be the insect purp the first purple of use, although the insect purp the first purple of use, although the insect purp the first purple of use, although the insect purp the first purple of use. by Mr Perley, may be of use, although the insect may not bethe some with that which has annoyed the fruit trees of our corres-pondent 'M.'" We then quoted from Kirby and Spence, notipondent "M." We then quoted from Kirby and Spence, notices of the Tinca Corticella, and Arborum Line aris, which we concluded might be identical with the insect first meationed by "M."

Having done with this insect we then took up the other on Having done with his insect we then took up the other on the last column of page 158 as follows, viz:

"The insect described by 'M,' page 142, found on the body of the tree about the size and shape of a small grain of coffee,", &c. See also our note p. 169—Editor.

† After we had commenced writing the editorial article p. 150, and hefore we had completed it, the "memorandum" was mislaid, and has not since come to hand. This we regret, as we set a high value on the communications of the author.—En.

can be made to quit their hold, which I have often seen in the common species of the myrtle, Coccus hesperidum. A little later the body is more swelled, and, on carefully raising it with a knife, numerous eggs of an oblong form will be discovered beneath it, and the insect appears dried up and remarks, you did not advert to in your Farmer of dead, and forming only a convex cover to its futhe 5th instant.* I regret that you overlooked a ture progeny. Under this protection the young conjecture hazarded in the memorandum furnished are hatched, and, on the approach of warm weayou, the substance of which was, that the "dark ther, make their escape at the lower end of the colored insect, on the body of the tree, about the shell which is slightly elevated at that part. They then move with considerable activity, and disperse bristly coat, and no wings," might be the apterous themselves over the young shoots or leaves. The female of a moth, several species of which (besides shape of the young coccus is much like that of that of the canker-worm) are common here t its parant, but the body is of a paler color, more That this insect had no connexion whatever with thin and flattened. Its six legs and proboscis are the minute muscle-like insects observed on the visible under a magnifier. Some species are covtrees no one can doubt who has read Mr Perley's ered with a mealy powder, as in the C. cacti, or communication on the bark-louse, a species of Cochenille of commerce. These little lice insert Coccus, and Mr Loudon's description of the Amer- their proboscis into the bark and leaves, and draw from the cellular substance the sap which nourishes them. Reaumur observed the ground quite moist under peach-trees infested with Cocci, which was caused by the dripping of the sap from the numerous punctures made by these insects. While they continue their exhausting suction of sap they increase in size, and during this time, are in what is called the larvæ state. When this bark-louse is the same as that described by Reau- is completed they are still of different magnitudes, mur and Geoffroy, and observed by Shaw and and set about their transformation by spinning Kirby on the apple-trees of England; but ours from the mouth minute whitish filaments, which agrees in size and shape with theirs, and it is are affixed in a radiate manner to the bark, and highly probable, if it is identical, that we are as which confine and secure the hody in its situation. much indebted to Europeans for introducing this (Do not these constitute the specks of blue mould and other lousy complaints, as they are to us for noticed by Mr Perley?) They now remain appathe American blight, which, however, I have never rently inanimate; but under these lifeless scales seen. In regard to the introduction of insects, I the metamorphosis of the insect is conducted; am fully persuaded that we have no species, it is this remarkable difference, that, in a few common with those of the Eastern world, which days, the large ones contrive to break up and throw have not accompanied man and his imports from off, in 4 or 5 flakes, their former coats, and reappear in a very similar form to that which they before had: the smaller ones, on the contrary, continue under their envelope, which serve as cocoons, and from which they seem to shrink and detach themselves, and then become perfect pupe, the rudiments of wings, antennæ, feet, &c. being discoverable, on raising the shells. If we follow the progress of these small ones (which are to produce the males) we shall see, in process of time, a pair of filaments and the tips of the wings protruding beneath the shell at its lower elevated part, and, through this little passage, the perfect insect at length backs out. The pupe coat of the female is never east off, so far as we can discover, but continues adherent and flexible, and the insect itself never afterwards changes place. The male is exceedingly small in comparison with the female, and is an anomaly in the order, (Hemiptera) having only two wings or hemelytra, though Latreille detected, in one species, vestiges of another pair of wings, which resembled the balancers of flies. The tail of the male is furnished with an elongated curved stilet, and a pair of slender, long, filaments. The ovaries of the female are fecundated through the small aperture beneath the lower tip of the shell. After this her body gradnally augments, becomes more convex, and when the eggs are matured they are extruded and spread by the contraction of her body beneath its envelope, till the foud mother perishes in her labors, but still shields with her body the eggs which are to give birth to her future offspring.

There are several broods of some species in

production.

the year. Of the bark-louse at least two are produced in one season. It is probable that the females of the last brood are fecundated in autumo, survive the winter, and thus provide for a succession of the species.

The writer of the article on Becs, in the North American Review, was too indiscriminate in denouncing all insects except the favorite elaborators of wax and honey. The single genus Coccus affords an ample refutation to the charge of universal noxiousness and inutility. Various tints of red are furnished by them from the splendid Carmine of the cochenille, to the duller hues of the scarlet in grain and the Polish coccus. The resin called lac is produced by a species of this genus, and has become essential in the composition of varnishes, japanned ware, and sealing-wax, and by a chemical process a beautiful pigment is obtained from it. The wax of China, called Pe-la is procured from certain trees, which are stocked, in that country, with Cocci for facilitating its

No species of SAPERDA, inhabiting the appletree, is known to us except the common one striped with white and brown, and which proceeds from the well-known borer. If there is another appropriated to this tree, we should like to see a description of it, and should be highly gratified to receive specimens.

With respect, your friend and servant, T. W. HARRIS. Milton, December 24, 1828.

FOR THE NEW ENGLAND FARMER.

VILLAGE ANECDOTE.

Ma EDITOR-It is encouraging to reflect, that however misled men may be, at times, by passions and prejudices, yet virtuous deeds and generous feelings, directed by a love of justice and peace, have something so amiable in themselves, that they will meet, not only with undisguised and general approbation, but they will create in society a predisposition to the same valuable end, offering thereby a strong assurance, that the human mind was intended by the Almighty Founder, as their native and prosperous soil. Nor is the magnitude of the object which brings those feelings into action, of much consideration; it is altogether the moral principle which gave them birth .-There is in them an irresistible charm to bring forth seeds of life, which otherwise might remain dormant and barren. It seems to be a duty, therefore, and it is a very pleasant one, to record those occurrences. In the present instance, the natural repository is assuredly the New Eugland Farmer, now of general circulation among that order of citizens, within whose ancient and noble avocation is to be found, the safeguard to the best interests of our country. After this short preamble, I will ask your leave to introduce the following anecdote.

Some time since, it was in October, the weather being favorable for clearing land, A. H. determined to burn away the brush in one of his pastures; the fire ran faster than expected, and extended into the wood lot of his neighbor, N. H., where it did considerable damage, before it could be aubdued. N. H. was absent on a journey, at the time, and on his return met with A. H., who and a strong taste of the seeds.* expressed his regret at the accident which had taken place, and his readiness to satisfy him for

trust, and let those men be you and I.

such cases two men have been known, at times, plenitude of their juice; if they remain on the not to agree, therefore, I would propose to you, to vines to become mellowed, the product will be leave it to one alone, and let that man be your a dead, flat and ill flavored wine. When the good self. You will take the case into consideration, and when we meet again, you will inform me to what amount you have fixed the loss .-The next time they met, A.H. informed N. H., that he had walked over his wood lot, and, that from flavor of the first class; but let the vintage rethe best opinion he could form of the injury it had main ten or more hours in the vat, the longer the received, he had estimated the loss at sixty-five dollars. N. II. professed himself perfectly satisfied strongly of the seeds. The juice of this grade with the liberal damages, which A.H. had brought may be called weak, sp. gr. 1.056-raise the in : but, neighbor, said he, it is a hard case, and, therefore, I will propose to you, that we should wine will be strong enough. divide the loss; you pay me one half, and I will hear the rest.

When an anecdote is clothed with that character of pleasantness, which seems to render its fiction. The parties alluded to, are Amos HAR-RINGTON, and NATHAN HAGAR, of the Rev. Mr may be of longer duration. FIELD's parish. Happy the town where hard cases, and all cases, are generally settled under the mild influence of such feelings! Happy the State where such spirit should prevail! Justice, equity, and peace! It would have a tendency to shorten and simplify the work of legislation, and to relieve of part of their labors the ministers of the law; it would hasten the promised and happy period, when the moral Rose is to bloom in the J. M. G. wilderness.

Weston, 29th Dec. 1828.

From the American Farmer.

GRAPES.

Retreat, near Dublin, Nov. 30, 1828. ISABELLA GRAPE .- Much paper and ink have heen wasted about the origin and value of the Isahella grape. I formerly understood, that Col. Hawkins obtained it from the garden of Mount Vernon, as a grape Fountainbleau; but, recently, the gentleman who succeeded Mr Hawkins as agent to the Creek Indians, informed me that the scions were received from Mr Fraser, a gentleman on botanical researches, who called it a French grape. Monsieur Roma had the same vine in his garden in Savannah, and said it was a French muscadel. It may be of much value to the north, where the climate suits it; but is worthless in the south, by reason of its ill habits. Half, or more, of the grapes, rot every, year be the season what it may; and only three or four ripe berries can be obtained from a bunch at one time, and nearly a month is required to ripen all the berries on a branch; hence it is no wine grape in our climate. When ripe berries can be obtained in sufficient quantity, it yields wine of nice flavor, provided the grapes are not too ripe, and the vintage remain only four or five hours in the vat; but let the grapes become mellow on the vines, and then let the vintage remain twenty four hours in the vat, and the wine is ruined-dull, heavy, flat,

ALEXANDER'S OR SCHUYLEILL GRAPE .- This

taken place, and his readiness to satisfy him for "These remarks, it will be ebserved, do not apply to the loss. Let us rafer the case, said A. II., and Isabella grapes, in our climate.—Ed. N. E. F.

the damages to be assessed, to two men we can grape is a native, and makes excellent wine under the following conditions: collect the grape so Your proposal, Mr A. H., is very fair; but in soon as the berries are of full color and in the grapes are mashed, or crushed in the vat, let them remain only one hour and a half, when the must will have obtained a sufficiency of color; press, and the product will be a crimson rose color, with worse, and the wine will be austere and taste must with brown sugar to sp. gr. 1.124, and the

CATAWBA. - This wine is said to be a native, and yields a superior dessert wine; and as Mr Adlum justly remarked, its vinous product suits all palates. Whether the flavor of this wine may be truth somewhat questionable, it is often styled a injured by the grapes mellowing on the vine is not good story. In the Italian language the same idea known to me; but that it may be materially inis prettily expressed by se non è vero, è ben trovato, jured by too long residence in the vat, before which translated, if it is not true, it is at least well pressing, is very certain. Five or six hours in dry imagined. But in the present instance there is no warm weather is long enough. In cool, or wet weather, the continuance of the vintage in the vat

BLAND GRAPE,-This is said to be of doubtful nativity. It makes good wine if we will have patience to wait for its maturity three or four years; it has a superabundant proportion of gum in the juice, part of which seems to be insoluble, and the lees formed by the vernal and autumnal fermentations do not subside and the wine become clear, without new additions of fining. No other wine that I have made requires refining. The vine and fruit are subject to mildew and rust.

WARREN VINE,-This vine seems to be of foreign origin, and is of the superior class of wine grapes. It is subject to rot considerably with me; its vinous product was adjudged by a gourmet to resemble the delicious wine of Cyprus.

ROUND VIOLET MADEIRA GRAPE .- This vine came from Madeira to Savannah, many years ago. The vine is not distinguishable from the Warren, but the fruit is of a lighter color, and the vinous product of a different flavor, and it is not subject to rot. It is a superior wine grape. The gourmet was probably correct about the flavor of the Warren wine, because all the wine grapes planted in Madeira, were transplanted from the island of Cyprus, in 1420, by Prince Henry of Portugal, Duke of Visco, together with the sugar canes of Sicily, for the use of the colonists.

Yours, respectfully, THOMAS McCALL. J. S. SRINNER, Esq.

Wholesome Advice, from Johnson's Letters .- Begin life with the least show and the least expense possible; you may at pleasure increase both, but you cannot easily diminish them. Do not think your estate your own, while any man can call upon you for money and you cannot pay; therefore begin with timorous parsimony. Let it be your first care not to be in any man's debt. Resolve not to be poor; whatever you have, spend less. Poverty is a great enemy to human happiness, it certainly destroys liberty, and it makes some virtues impracticable, and others extremely difficult.

There are no less than 2,533 varieties of the Rose, of which 18 belong to the Moss Rose, 20 to the Dog Rose, and 1.215 to the Provence Rose. Fron the New York Farmer.

ON USE OF GYPSUM IN AGRICULTURE.

Sir-The extensive application of Plaster of Paris in the interior of this state, to the purposes of husbandry, induces me to hazard a few remarks upon the causes of its fertility, and the soils and crops to which it may be advantageously applied. I perceive that many of our farmers, although slow to adopt this or any other innovation upon old habits, now that they have become satisfied of the benefit of plaster in some cases, seem to infer that it is useful in all, and thus apply it without "rhyme or reason." The consequence, I fear, will be to bring it into disrepute and lead to its rejection in cases where its utility is unquestionable.

The most common opinion is, that this substance benefits crops by drawing moisture from the atmosphere. This theory proves too much: for if it has so strong an affinity for moisture, it will attract it from the soil as well as from the atmosphere; and thus rob the plant, instead of increasing their supply, of this essential agent of vegetable developement. But it has been proved that gypsum absorbs moisture far less powerfully than putrescible manures, or even common soils, and retains it a shorter time. Johnson has given us, in his essay on the use of salt in agriculture, tables exhibiting the absorbent and retentive powers of different substances. I subjoin an extract in proof of my position :-

"Horse dung evaporated previously parts. to dryness, at a temperature of 100°, absorbed, during an exposure of three hours to air saturated with moisture at 62°,

Putrified tan bark, under like circumstances, (66°,)

Unputrified, do Cow dung do Pig do do Sheep do do

Refuse Salt (60°) Burnt Clay,

The richest soil (in one hour) Lime, (part carbonate)

Gypsum,

Pig dung, evaporated to dryness, at a temperature of 1060 (the heat of a meridian sun at midsummer) and then moistened with six parts of water, required for being reduced to to dryness again, at the above temperature.

Horse dung, under similar circumstances,

Common Salt. Rich Soil,

Poor Soil (silicious,) Gypsum,

Thus it appears, that the absorbent power of horse dung is sixteen times greater than that of greater. Let us not lose sight of another important fact which these experiments suggest, viz: That the power of a soil for absorbing and retaining moisture, and of course of resisting drought; is in the ratio of the dung and vegetable matter which it contains-rich soil suffering least, and poor soil most in dry weather .-Ploughing and hoeing frequently tend very much to increase, or rather to bring into full

and retaining moisture.

solidifies it. It is by this process that it is fitted for cornices, busts, &c.

inert vegetable matter soluble, and thus increasing the supply of vegetable food. The experi-

animal and vegetable putrifaction.

Some, supposing that plants are gifted with sensation, contend, that gypsum acts as a condiment to the vegetable, as spices do to the animal system, and benefits by stimulating their absorbent and assimilating organs. I am not two bushels the acre. phisiologist enough to discuss this point, and will therefore barely observe, that if this is so, all plants are not equally sensitive; for many

are certainly not affected by this stimulus. Others again have maintained, that plaster decomposition or separation of parts, takes place in the soil. Sulphuric acid has been applied, blended with different parts of water, without seeming to confirm this theory. But a sufficient objection is found in the fact, that gypsum is detected in the clovers and other plants, showing that no decomposition has taken place, and that the sulphuric acid, remaining chemically combined with its base, could not have acted separately.

Sir H. Davy, I think, has suggested the true 115 as necessary a constituent of some plants, as a few 180 drops of peppermint do to a mint sling; and that 120 when the soil does not contain it, in the small lowing rules for the consideration of the farmer: 31 proportion needed, its application is necessary 49 Of the plants which contain gypsum, Sir II. their vigor, and thickens the soil. Davy has enumerated the clovers, luzern, sanfoin els on an acre of these plants. The turnip crop yields it in small quantities; and if this theory is correct, Indian corn and potatoes will afford rendered so by draining. it, as it evidently benefits these crops. He adds, as wheat, rye, barley, &c. A course of experiments during ten years, has satisfied me that either naturally or by the application of dung. these crops are not benefited, directly, by its 32 application, but often indirectly, by increasing 25 the growth of other vegetables, which ultimately enrich the soil.

The soils which plaster most benefits, are the poor lean sands and sand loams; and its effects plants. gypsum, and its retaining power seven times diminish in proportion as these become more rich, adhesive, or wet. The dung of cattle contains gypsum; so does peat or bog earth. To lands often dunged, its effects are consequently less perceptible. That it does not prove efficacions and upon tilled crops before the hist ploughing, upon wet lands may be accounted for by their producing plants which contain gypsum.

As to the time and manner of applying plaister,

operation, these qualities of soils for absorbing mouths of plants until it is dissolved, or become soluble. To effect this, 500 times its weight of After water has been expelled from plaster of water is found to be requisite. This would seem paris by burning or heating, it then again able to indicate that it should be sown early on grass sorbs it powerfully-and not only absorbs, but lands. My practice has been to sow in March, or early in April, and if practicable, upon a light snow. When sown late, and a cry summer en-Another agency which has been ascribed to sues, its benefits are frequently not perceptible. plaster in the process of vegetation, is that of ac- probably from the circumstance of its not having celerating putrefaction in the soil-of rendering been dissolved. I have followed the example of two great pioneers in the improvement of American husbandry, the late Judge Peters and ments of Sir H. Davy disprove this theory, and John Taylor, in sowing it for Indian corn and show that gypsum rather retards than increases potatoes before the last ploughing. I consider the benefit in this method more certain and the labor less, than in that of strewing it on the hills of the growing crop.

The experience of practical men seems to have fixed the proper quantity at from one to

Plaster appears partially to have lost its efficacy in some parts of Pennsylvania, where it has been longest and most successfully used. It is said, to adopt the common language, that the soil has become tired of it. I suspect too much owes its utility to the sulphuric acid (oil of vit-reliance has been placed upon it; and that it riol) which it contains; and of course that a has been used as a substitute rather than as an auxiliary, for old fashioned barnyard dung. There is another way of accounting for its apparent failure. Has not the soil become tired of the plants which it aids, and which may have exhansted it of some other constituent? In the Norfolk system of alternate husbandry, it was long ago ascertained that clover could not be sown to advantage oftener than every second course, or once in eight or ten years, and other grasses were consequently alternated with it. The practice in Pennsylvania has been, I believe, cause of the fertility in gypsum: That it forms to continue sowing clover every four or five years.

The preceding view of the subject and my personal experience, induce me to offer the fol-

1. That plaster may be applied to pasture and for their complete developement and perfection meadow lands, not absolutely wet, with strong -and that it is only useful to such crops as yield probability of profit-as it undoubtedly forms a 23 it on analysis, and on soils where it is deficient. constituent of many of the grasses, increases

2. That it may be applied, with equal prospect and some other grasses; in which he he'ieves of success, to the maize and potato crops, and I it may exist to the amount of three or four bush- think, to legumes, such as peas, beans, &c. These being sown, as good husbandry implies, upon lands naturally free from surface water, or

3. That its benefits are greatest upon sands, that gypsum is not taken up in corn crops, such gravels, and light loams; and that these benefits diminish in proportion as the soil becomes rich.

> 4. That plaster can never become a substitute for dung, but may be rendered a valuable auxiliary-henefiting some crops directly, and all remotely, by increasing the volume of vegetable matter, which ultimately becomes the food of

5. That from one to two hushels per acre is a sufficient annual dressing for lands.

6. That upon grass it is most profitably sown carly, that the vernal rains may render it soluble; that the moisture in the soil may perform this generally abounding in bog soil, and not usually office in season, in both cases, to benefit the summer's growth.

And, finally, That its use can be best regudifferent opinions prevail. It cannot enter the lated by the farmer himself carefully noting its

effects upon different crops, soils, &c. always leaving a strip unplastered upon crops which it is supposed to benefit, and plastering a strip upon those on which its benefits are doubtful. J. BUEL.

Very respectfully, Albany Nursery, Nov. 24.

ON THE CULTURE OF THE VINE.

In February, take a single joint of the vine you choose; cut it off a half an inch above the eye, and again at two inches below the eye; cover each end with sticking plaster of any kind, and set it in a pot of garden mould, above five ed world.

or six inches in diameter, and unglazed. The A pleas eye of the cutting must be covered with earth, and then watered to settle the ground; after this lay half an inch of horse manure on the surface lately come under our notice. The Rev. Dr to keep it from becoming dry and hard, and place Buckland, of the University of Oxford, England, the pot in a hot bed prepared for raising cabbage plants. If more than one shoot rises from the eye, rub off all but the strongest. About the found in diluvium not long ago, in the kingdom first of June, turn out the vine from the pot, and of Ava. It may not be known to the generality set it in the garden, or at the east or north end of our readers, that naturalists were already acof your house; wherever it can be protected quainted with six species of this gigantic genius from violence. It will grow in any soil, but like of animals, of which none are now found alive. other plants it grows best in the best soil. When Of these, one was peculiar to North America, first removed, water it at a distance from the two to Europe, two to South America, and one plant, so as to draw the earth toward the vine, common to Europe and South America. The instead of washing the ground from it. If you recent discovery of similar remains in Asia has water it afterwards, pour your water into a trench excited much interest among naturalists. It at least eighteen inches from the plant; for un- is now ascertained that these Ava Bones, alless this precaution be used, watering does more though resembling those of Mastodon in size harm than good, and does most injury in the and structure, yet differ from all those known, driest time. As the vine shoots, it must be pre- and have accordingly been designated as two vented from falling. In November, a slight distinct species, and increasing the number now covering of straw is beneficial to prevent freezing and thawing of the vine. In February it must be trimmed by cutting it off at a half an inch above the eye; all the eyes below are to be carefully rubbed off, as being imperfect:-The eye thus left will sometimes produce more than one shoot, in which case all but the strongest should be rubbed off. In November, this shoot is again to be covered, and in the following February is to be again cut off above the second lowest clasper: that is leaving on two eyes to shoot this season, and again rubbing off all the eyes below the lowest clasper. Both these shoots should be permitted to grow their utmost length; which if the soil be favorable will be very considerable, and there will be reason to hope for fruit in the next season. In the third February cutting, three eyes upon each shoot mabe left, and no more. From this time forward all the side branches from the shoots of the year are to noceros, the Hippopotamos and various antibe rubbed off, taking care not to injure the leaf deluvian animals. Our own country is covered whence they spring, which is the nurse of the in every direction with diluvium of the same ebud at the root of its stem.

from that time forward, it may be cut about the ticipated. last of October; four eyes may then be left, and state of growth, for the injuries thereby done to the vine will be seen and lamented in succeeding

NATURAL SCIENCES.

Every day affords us evidence of increasing intercourse between the naturalists of Europe and this country. This is as it should be, for, to say nothing of its obvious tendency to soften the asperities, and diminish the coldness which frequently occur between the learned of different countries, this mutual communication of friendly offices and early notice of each others labors, is of great importance to the whole learn-

A pleasing instance of attention from one of the most distinguished Geologists of Europe to the Lyceum of Natural History of the city, has has presented to this society a set of casts of the teeth and bones of two species of Mastodon, known to eight.

The casts referred to are such exact and ad mirable copies of the original remains, and the colors are imitated in so perfect a manner, that they exhibit altogether a proficiency in the plastic art, which our artists would do well to study.

The discovery of these remains must have been highly gratifying to that distinguished naturalist, Dr Buckland. In his celebrated work, "Reliquiæ Diluvianæ," in giving an account of the remains of the Elephant, the Rhinoceros, &c, &c, found in the European deposits of Diluvium, made by the last great deluge that has swept the face of the earth, he anticipated a repetition of the same circumstances in distant d. posits of Diluvium to be hereafter discovered an anticipation which has been realized, by the discovery of these Bones in the Kingdom of Ava, accompanied by those of the Elephant, the Rhiriod, and from the examination of which many At the fourth time of cutting the vine, and new and interesting discoveries may be also an-

Kitchen Economy .- A friend has mentioned the fifth cutting, five eyes may be left on each to us an improvement in kitchen economy which shoot and never more, even in the most vigorous we think deserving of notice. It may be called an iron back log, and is cast hollow, to contain water. A small leaden leader is attached to the 2 th ult. On the 28th she was launched, of a wood fire, and connected with a cask or tub expert builders, Messrs. The family may thus have a 5000 reams of crown, medium, and royal patent constant supply of hot water, without incumber- straw paper, with patent book and paste boards; You must wait till the paroxysm of passion has ing the fire-place, and with much less than the and left this place early on the 30th ult. for subsided, and the impatient sufferer becomes ordinary consumption of fuel for that purpose. - Putsburgh, with about 20 passengers on board. Long Island Star. .

GOLD WASHINGS.

Strange as it may appear, it is a fact, that till very lately the jewellers were in the constant practice of throwing away the water into which they dip articles of jewelry after they are taken out of the boil (a menstrum of nitro muriatic acid, employed to give them a high finish,) without being at all aware of the quantity of gold that was thrown away with it. Of late a person possessed of some chemical knowledge is said to have made a handsome livelihood, by instructing jewellers, at the rate of five guincas each, in a method of recovering gold contained in the washing. This method consists simply in adding a solution of copperas, which precipitates the gold. and then fusing the residuum with nitre, by which the iron in combination is oxidated, and the gold left in a pure state. - Mechanic's Magazine.

In boring for water on the island, at the upper end of this village, owned by Mr Sewell, a vein of water was struck at the depth of 160 feet. which emits an inflammable gas in large quantities. It is so perfectly free from the nauseous smell of the oil gas, that its existence was discovered only by the casual introduction of a light into the mouth of the well .- Watertown Register.

Damask Table Linen .- Mr Hamilton Stewart, of Pittsburgh, has commenced the manufacture o Damask Table Linen. The Statesman of that city observes, that "the Table Cloths are extremely neat, and what is of equal importance, they are very cheap, and of a texture that will insure service and durability. In weaving the cloth, the threads are so arranged and managed, that almost any figure, name, or letters can be made to appear in full view upon the surface."

Method of curing Pork Hams, to make them far superior to those cured in the common way .-To twelve common size hams, such as are cut from hogs weighing from 140 to 200 pounds, take 12 lbs. fine salt, Soz. of salt petre, and 3 pints of molasses-mix them well together-rub the hams with it, and pack them down in a tub or cask, and let them lay one week-then put to them pickle enough to cover them, made as follows :- To 3 gallons of water, put fine salt enough to make it bear an egg-add I quart of molasses, 2 quarts of strong ashes lie, (made from ashes without lime) and a porter bottle of purified pyroligneous acid-let them lay in it four weeks-then take them out and hang them up in a dry room-when dry they are fit for use.

llams cured in this way are clean, tender, juicy, and fine flavored, without the waste occasioned by the drying and filth of smeking in the chimney or smokehouse .- Newport Republican.

Cleared from the port of Meadville, (Pa.) the fast sailing boat "THE ANN ELIZA."

All the materials of which this boat was built were growing on the banks of French Creek, on this iron cylinder, which is placed at the bottom and protect to this place before sunset, by her -- Crewford Mess.

NEW ENGLAND FARMER.

BOSTON, FRIDAY JAN. 2, 1829.

BROAD WHEELS.

To preserve a road by improving the wheel earriages which pass over it, all agree that the wheels should be made broader than they usually are, and cylindrical: that carts with two horses abreast are less injurious than such as are drawn by two horses in a line: and that it would be an advantage to have the axletrees of different lengths.

Edgeworth, upon a careful examination, concludes, that the system of rolling roads by very broad wheels must be abandoned; and that such a breadth only should be insisted upon, and such restrictions made as to loading, as will prevent the materials of the road from being ground to pow-der, or from being cut into ruts. With this view the wheels of carriages of burden should have felloes six inches broad, and no more than one ton should be carried on each wheel.

Farcy is of opinion, that six inch cylindrical wheels, or under, are the most practicable and useful, provided the projecting nails are most rigidly prohibited, which can never be done but by a penalty per nail upon the wheelers who put in those nails, and upon the drivers of the carriages, who use such roughly nailed wheels.

Telford thinks that no wagon or cart wheel ought to be of less breadth than four inches, and that in general no carriage ought to be allowed to carry more than at the rate of one ton per wheel: " when it exceeds that weight," he says, "the best materials which can be procured for road-making must be deranged and ground to pieces."

Paterson is a warm advocate for broad wheels. "If the wheels were used double the breadth as at present," he says, "they would act as rollers upon the materials, binding them together, and consequently the surface would always remain smooth and free from ruts; and the waste or decay, would, of course, be exceedingly little." All broad wheels, however, should be made on a construction different from those that are in common use. Those in common use, whether broad or narrow, are generally dished (as it is called) on the outside, and the ends of the axletree bent a little downwards. This causes the wheels to run wider above than below; and the reason, I believe, for adopting this plan, was to allow people to increase the breadth of their carriages, and get the wheels to run in the same track. Upon this plan, the edges of the wheel, to run flat on the road, must be of a conical shape, the outer edge being of less diameter than the inner one. Any bad effect arising from this is indeed very little felt from the narrow wheels; but as they increase in breadth, the evil increases in the same proportion. "A conical wheel," says Edgeworth, "if moved forward by the axletree, must partly roll and partly slide on the ground, for the smaller circumference could not advance in one revolution as far as the larger. Suppose," says he, "the larger revolution sixteen feet, and the smaller thirteen feet, the outer part must slide three feet, while the carriage advances sixteen, i.e. it must slide nearly one fifth of the space through which the carriage advances,thus, if loaded with ten tons, the horses would been ably and beautifully demonstrated by Cum-Carriages, &c.) and is very easily illustrated; take ons, even by their perpendicular pressure, do injury, 1825, will bear fruit this year; but a small por-

from which you have broken off a little bit at the point; then set this a rolling upon a table, and instead of going straight forward it will describe a circle; and if you will put a pin or axletree right through the centre of it, and upon that axle cause it to move straight forwards, the smaller diameter must slide instead of rolling. It is evident, therefore, that the rims of the wheels ought to be of a cylindrical form. Edgeworth states in relation to this, that "from the testimony given to the committee of parliament, by every person of science and judgment, cylindrical wheels and straight axletrees have been unequivocally preferred.'

Farcy finds the Whitechapel road more injured wheels being barrelled and conical, and not running flat, and the middle tier projecting above the others with rough nails.*

Cumming has proved experimentally, before the

committee of 1808, that when the rim of a wheel progress on a smooth road is not increased by increasing its breadth. And in regard to the immense saving that would accrue to the nation, Jessop, in his report, says, "I may venture to assert, that by the exclusive adoption of cylindrical broad wheels, and flat roads, there would be a saving of one horse in four, of seventyfive per cent in repairs of roads, fifty per cent in the wear of tire, and that the wheels with spokes alternately inclined, would be equally strong with conical ones, and wear twice as long as wheels do now on the present roads." But over and above the preference due to such wheels, in respect to public roads, they are no less preferable when applied to purposes of husbandry. Besides the great resistance to the draught occasioned by the sinking of the narrow wheels on soft land, every farmer knows what injury is frequently done to subsequent crops by such poaching and cutting up of the land. But this is not all. Many a field of beautiful pasture, when subjected to the destroying operation of the narrow wheels, is very much injured, both in respect to the appearance and the crop, which would be entirely prevented by using broad wheels. Thus it has been stated in regard to the introduction of the use of broad wheels, that the saving on the incidental repairs of the road would be immense; that the roads would uniformly retain a smooth and even surface, which would greatly contribute to the comfort of the traveller, and the ease of the draught; that in husbandry also the

row wheels. M'Adam thinks a wagon wheel of six inches in breadth, if stauding fairly on the road with any weight whatever, would do very little material injury to a road well made and perfectly smooth.-The injury done to roads is by these immense weights striking against materials, and in the present mode of shaping the wheels, they drive the materials before them instead of passing over them. If a carriage passes fairly over a smooth surface, he have two tons to drag, as if that part of the weight says, that cannot hurt the road, but must rather be was placed on a sledge." The same thing has an advantage to it, on the principle of the roller. On being asked, "are you not of opinion that the imming, (Essay on the Principles of Wheels and Wheel meose weights carried by the broad wheeled wag-

advantages would be great; in short, that in eve-

ry point of view, the benefits that would be de-

rived in consequence, would be paramount to ev-

erything that would be urged in favor of the nar-

for instance, the frustum of a cone, or a sugar loaf, by crushing the materials?" he answered, "On a new made road, the crush would do mischief, but on a consolidated old road, the mere perpendicular pressure does not do any. But there is a great deal of injury done by the conical form of broad wheels, which operate like sledging, instead of turning fairly. There is a sixteen inch wheel wagon, which comes out of Bristol, that does more injury to our roads than all the travelling of the day besides."

With regard to regulating the weight to be carried on wheels, Farcy judiciously observes, that though it is not easy to state any one scale that would be generally applicable for each breadth of wheels below six inches, there should be a rate by broad wheels than any other, owing to those fixed, which should apply to ordinary or gatetolls; and at the weighing machines additionalor what may be called machine tolls, should be levied upon all carriages which exceeded the weight, to be regulated in an increasing scale for each breadth of wheels, so as very greatly to is made truly cylindrical, so as to have an equal discourage, but not ruinously to prohibit the occabearing on its whole breadth, the resistance to its signally carrying of large weights upon any wheels.

Axletrees of different lengths have been proposed by some engineers, with a view of preserving the roads. On this subject Paterson observes, "at present the axles of all kinds of carriages are made to one length, so that their wheels all run at the same width, and in the same track, than which nothing could be more fitly devised for the destruction of the roads. I would, therefore, propose that the length of the axletrees should be varied, that the wheels of the lighter description of carriages should run two inches narrower than the present track; and that the axles for the more weighty carriages should be increased in length. so that the wheel should run from one to four inches beyond the present track. I would also propose, that mails, and other heavy coaches, should be so constructed, that the hind wheels should follow either two inches within, or two inches outside the track of the fore wheels, as might be considered most proper. Were the axictrees of all kinds of carriages to be of various lengths as here proposed, we should have no rut-The stones now displaced by the ted reads. wheels of one carriage, would be replaced again hy the next carriage that came up, having its axle of a different length; and in the same manner would the hind wheels repair the injury done by the fore wheels of a carriage. If this plan was to be acted on all over the kingdom, it is evident that it would have a very heneficial effect on the roads; and if it should be found thus to contribute to the keeping the roads smooth and even, it is also evident that it must contribute in the same proportion to the comfort of travellers of every description, and also to the ease of the beast of draught.

CULTURE OF THE GRAPE.

The following extract of a letter of a recent date, written by a gentleman who is well qualified to speak upon the subject, shows what may be done in this interesting pursuit, which is now occupying the public attention. The writer resides on the Georgia side of the Savannah river, a few miles above Augusta,

"Send me a quarter cask of Madeira Wine-I hope soon to make some of this article for sale, The vines I got from Adlum, of Georgetown, in

tion of them took root; I have, however, now got near 800 vines growing, and I am increasing the vineyard-in three years, from what already is planted, I expect to make at least 40 pipes, and increase yearly. . I have for four years past made a little wine from 11 old vines in the garden, equal to most Madeira imported, none who have tasted it believed that such wine could be made in America."-Charleston Courier.

Culture of Silk .- Within a few days our attention has been called to this useful and highly interesting subject .- Mr Canfield, a respectable and intelligent farmer of the town of Clay, in this county, informs us that he intends as soon as practicable to engage in the profitable business of rearing the Silk worm-that he contemplates appropriating six or more acres of ground to the culture of the Mulherry tree .- Syracuse Advertiser.

Feeding and fattening Fowls .- Fowls will become fat on the common run of the farm-yard, where they thrive upon the offals of the stable, and other refuse, with perhaps some small regular daily foods; but at thrashing time they become particularly fat, and are thenco styled barn-door fowls, probably the most delicate and highly flavored of all others, both from their full allowance of the first grain, and the constant health in which they are kept by living in a natural state, and having the full enjoyment of air and exercise. It is a common practice with some housewives to coop their barn-door fowls for a week or two, under the notion of improving them for the table, and increasing their fat; a practice which, however, seldom succeeds, since the fowls generally pine for the loss of their liberty, and slighting their food, lose instead of gaining additional flesh. Such a period, in fact, is too short for them to become accustomed to confinement.

Eggs become desiccated, and, in consequence, lose great part of their substance and nutritive quality, by keeping, and everybody knows the value of a fresh-laid egg. They will retain their moisture and goodness; however, three or four months or more, if the pores of the shell be closed and rendered impervious to the air by some unctuous application. We, generally, anoint them with mutton suet melted, and set them on end, wedged close together in bran, stratum super stratum, [layer above layer] the containing box being covered closely,-laid upon the side the yolk will adhere to the shell. They thus come into use at the end of a considerable period of time, in a state almost equal to new-laid eggs for consumption, but ought not to be trusted for incubation, excepting in the case of imported eggs of rare birds.

Ice a Medicine. - The custom of taking ice in Italy and Sicily is considered as an indispensable refreshment and as a powerful remedy in many diseases. The physicians of these countries do not give many medicines; but frequently prescribe a severe regimen, and prevent the baneful effects of various diseases, by suffering the sick, for several days, to take nothing but water cooled with ice, sweet oranges, and ice fruits .- American Sentinel.

Orchard Grass Seed.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston,—a consignment of prime Orchard Grass Seed, raised by Mr LLOVD JONES, of Penn-

ful cultivater of this valuable grass in this country, as the follow-

ing letter shows MR RUSSELL,-In regard to the character of Mr Jones' seed, I have pleasure in sugging, that it is the best in this market, and always commands an extra price. Col Powra, always purchases of him, not only for himself but for his southern friends; and the Pennsylvania Agricultural Society, at their last exhibition, awarded him the premiums for both Orchard Grass and Cherr Seed. Grass and Clover Seed.

Yours, &c, JOHN P. MILNOR

Recording Secretary Penn. Agri. Society. Gentlemen who wish to secure a supply of this seed, will do well to secure it soon.

Also, a most extensive supply of Garden, Field, and Flower Seeds, raised expressly for us, or procured from the most unquestionable sources.

Canary Birds.

For Sale, a few copies of the New and Complete Causary Bird Fancier, containing a variety of useful information, by which the admirers of those beautiful Birds may be instructed in their management while breeding, and their treatment when diseased; with useful Hints to the breeders of Mules. From the latest London Edition.—Price 25 ets. Just received at the

Agricultural Warehouse. Mo. 52 North Market Street, Boston.

Valuable Real Estate, &c, For Sale. The Subscriber offers for Sale, the following Real Estates in

The Sabactioer oners for Sale, the holowing freat Estates in Durham, N. H. viz:
About 50 acres of land, under good cultivation, with tolerable buildings thereoa —Soil of excellent quality, and capable of a high degree of improvement. Also, a Farm on the New Hampshire Turnpike road, containing about 50 acres, with buildings nearly new.

Also, a Farm of about 110 acres, with new buildings, lying

Also, a Farm of about 110 acres, with new buildings, tying within two miles of the New Market Factories.

Also, a small Farm lying in the Great Bay containing 30 or 40 acres, a very productive and excellent tract of land, in the neighborhood of the above named Factories.

Also three Houses in the Village of Durham—one of them possessing excellent accommodations for a Tavern.

Also, a Parm in Lee, emittining about 80 acres, acres, well

Also, a Wood Lot in Barrington, containing 105 acres, we wooded. He also offers for sale, a Stud Horse of approved blood, and

several Mares and Colts of different ages.—All kinds of Farming Utensils, and Stock of all sorts. The above described Lands are within a short distance of th large Factory Establishments at Dover and New Market.
Durham, Dec. 26, 1828.

JOHN FROST.

Two Heifers For Sale.

Two Superior Heifers, with calf, mixed between the Dento and Coelebs breed. Both of which took a premium at the late Show in Brighton.—Inquire of Daniel Chandler, Lexington, o at the counting room of the New England Farmer, Agricultura Warehouse, Boston. 3t Jan. 2, 1829.

Splendid Bulbous Roots, &c.

A further supply of Hyacinths, Tulips, Narcissas, Gladiolus, Snow Drops, Corous, Star of Bethlehem, Jonquilles, Ranunculs, Iris, Crown Imperials, Anemones, Crocus, &c. from 12 to 62 cts, each. A very lew of the floest Hyacinths, dark and pale blue, pure white, red, yellow, and white with various eyes, at 31 per root.

Seeds for the West Indies.

Merchants, masters of vessels, and others trading to the Wes Indies, can be furnished with boxes of Seeds, assorted, suitable andies, can be infinished with doxes of seeds, assorted, suitable for that market, at from \$\frac{1}{2}\$ to \$\frac{5}{2}\$ per box.—Each box contains upwards of sixty different kinds of seeds, vegetable and ornamental, in quantities sufficient for a common kitchen garden.— Likewise the greatest variety of seeds to be found in New Eng land, by the pound or bushel, all warranted pure, and of the grow of 1827.

Field Peas.

A consignment of 50 bushels of Field Peas, from Vermont, so the growth of 1827, in good order. They will be sold by the tierce at \$1.75 per bushel.

Oat Meal, &c.

Fine Ont meal and Ont Flour, Hulled Oats, Hulled Barley, Barley Flour, &c. for sale by the barrel or less quantity, direct from Stevens' Mills, Vermont.

American Tree Seeds.

For sale, a variety of Seeds of Forest Trees, Shrubs, &c. For sale, a variety of Seeds of Forest Trees, Shrubs, &c. mostly native American kinds, and suitable for sending to Europe, or for cultivation here. Price 25 cts a paper. They were gathered by a gentlenan familiarly acquainted with the sorts, expressly for us. They will be sold by the single paper, or packed to order, in any quantity.

Also, Peach and Almond Stones, and many other valuable Fruit and Forest Tree Seeds for planting this fall, a catalogue of which may be had gratis at this place.

Garden and Field Seeds.

Garden and Field Seeds.

The largest collection and variety of Garden, Field, 'Tree and Herb Seeds to be found in New England, at wholesale and retail. Orchard Grass Seed, raised by Mr LLOVD JDNES, of Penn- The Seeds are all raised in this vicinity, expressly for this Essylvania, who is well known as the most extensive and success- tablishment, by careful and experienced grawers, and are war-

ranted pure and fresh. Country traders supplied with boxes of prime seeds, for the retail trade, on liberal terms. A pamphlet catalogue (2d edition) of our Seeds, Trees, &c. is published and will be forwarded graits to any one who will send for it.

Orchard Grass Seed. A few more bushels of this valuable Grass Seed, growth of

1828. Also, Lucerne, White Clover, Fowl Meadow, and every other kind of Grass cultivated in New England. White Mutberry Seed.

This day received, a few pounds of warranted geatine White Mulberry Seed, raised in Coventry, Con. this season, and saved with care expressly for us.—For sale by the lb. or ounce. Shallots for fall planting, Tree and Potato Onions.

Tungier Caulylfoncer.

We have just received through Mr Maluay, the American Consul at Tangier, a few lbs. of this celebrated Canliflower seed. A small parcel was sent to the Hun. Jonathan Hunewell of this city, a few years since, who pronounces it altogether superior to any seed from England, and which produced cauliflowers much finer than any he had seen cultivated in this country. Roots of the Pie-Plant, or Tart Rhubarb.

Rouse 91 nee rie-riant, or I'm Hubbarb.

A large supply of the roots of the Rheum Undulatum, or Tart

Rimbarb, or Pie-Plant, an excellent article for summer use.

(See N. E. Farmer, vol. vi., page 290, and page 11 of this values, and Fessenden's New American Gardeuer, article Rhubert, for its culture and uses.) The roots are in fine order for transplanting this fall. Price 25 ets, per root Seed Potatos.

A few bushels La Plata or Long Hed Potatos, raised by Mr Gourgas of Weston; selected for seed, of a uniform size, and much improved as to their earliness, by the careful attention of Mr G. For sale at the

New England Farmer Seed Store, No. 52 North Market, Street-Boston.

MISCELLANIES.

NEW YEAR ADDRESS

To the Patrons of the New England Farmer.

AGAIN the incessant lapse of Time
Demands our Monument of Rhyme,
Like that which Horace bragg'd about,
And tall enough the skies to flout,
Compared with which the Tower of Babel
Would seem the lean-to of a stable.

We 're highly gratified to find, The public more and more inclined The Cultivator's art to practise, And patronize, because the fact is That righteousness and cultivation Go hand in hand t' exalt a nation: And Husbandry 's a hobby which A world may ride with spur and switch, (Though not like jades, which will not stir Without the aid of switch and spnr) ;-If all mankind at once bestrode him They could not tire nor overload him. Not only men, who sit astride, But Ladies also on a side-Saddle so neat, or on a pillion, That's big enough to hold a million, May ride our hobby with a cheer-up, And he'll not kick, bite, plunge, nor rear up, But vires in eundo crescit,* As cousin Virgil somewhere has it. So Fire, which has obtain'd ascendence, When setting up for independence, Prepares by heat of radiation Combustibles for conflagration ;-By burning fast, the mighty master Acquires fresh means of burning faster, Till blazing pyramids arise, Which threaten to consume the skies.

With ken prophetic, we behold A brighter age than that of gold, Which, with accelerating pace, Is hurrying on to bless our race; And hail its grand approximation, Mark'd by superior cultivation, When wise men's heads, and good men's hearts, Devoted to the art of arts, And industry's untiring hand, Shall make a garden of our land-Yea, make New England, all exceeding, A new edition of old Eden, If not quite equal, yet before it, In many a root, and fruit, and floret, Indebted for its propagation To modern arts of cultivation.

We're tranced with rapture, when we find
The fairer moiety of mankind,
Whose smile makes mortal man's condition
But little short of sheer fruition,
By whose society is given
Earth's purest prototype of Heaven,
Th' angelic part of human nature
Inspire and aid the Cultivator.
A plant that 's sunn'd by Ladies' eyes
Will like ao exhalation rise,
We hope that Horticulture may
Be therefore blest with Beauty's ray,
Till Flora's germes gem every waste,
And every grove 's a "Bower of Taste."

Adam, in Eden, we believe, Had been a brute without his Eve; An arid heath, a blasted core on, Blest with the smiles of lovely woman, We should prefer to a:l that 's rare In paradise, without the Fair. We therefore pray that Friendship's hand From every Lady in the land, May be to us henceforth extended, From this time till our time is ended; And would solicit every Charmer To please to patronize our Farmer, And make those gentlemen, who claim Her approbation, do the same; And common justice must require her To grant this boon to an admirer Like us, so prone to chaunt her praises, In verse which absolutely blazes.

His head is very like a stump Whate'er its craniologic bump, Who does not see that we the Tillers Of Earth compose the nation's pillars, And may be styled with strict propriety The props of civilized society. What would have been poor mertals' lot-Yea, what were man, if we were not? Nature's poor, simple, houseless child, The weakest wild beast of the wild, Must live on browse, his home must be A cavern or a hollow tree; Sometimes, in spite of fears and cares, Be served up raw to wolves and bears, Or maugre tooth, nail, fist, and truncheon, Make hungry catamounts a luncheon.

Our art, moreover, claims ascendence As german to our Independence; Both, commonly, are coexistent, And each the other's best assistant. We Farmers are a sort of stuff, Tyrants will always find too tough For them to work up into slaves, The servile tools of lordly knaves. Those men who till the stubborn soil, Enlighten'd, and inured to toil, Cannot be made to quail or cower By traitor's art or tyrant's power, They might as well attempt to chain The west wind in a hurricane :-Make rivers run up hill by fright'ning, Or steal a march on kindled lightning-The great sea-serpent, which we 've read of, Take by the tail and snap his head off-The firmament on cloudy nights, Illume with artificial lights, By such an apparatus as Is used for lighting streets with gas-Or, having split the north pole till it's Divided into baker's billets, Make such a blaze as never shone, And torrefy the frozen zone-With clubs assail the polar Bear, And drive the monster from his lair-Attack the comets as they run With loads of fuel for the sun, And overset by oppugnation Those shining colliers of creation-The Milky Way Mc'Adamize, A railway raise to span the skies, Then make, to save Apollo's team, The Solar Chariot go by steam .-These things shall tyrants do, and more

Than we have specified, before Our Cultivators they subdue, While grass is green, or sky is blue.

Ent this is spinning out sublimity, As one would cotton yarn for dimity; We'll therefore break our thread off here, By wishing you a happy year, And all good things, which can be given To man from all indulgent Heaven. Boston, Jun. 1, 1829.

High Life and Domestic Life.—The gayest votary of pleasure, who pursues the phantoms of genteel dissipation, is generally the dullest of domestic companions. In choosing a partner for life, the selection should not be made merely from public appearances. The undisguised realities of private life, the indications of worth or unworthiness, which the family fireside exhibits, are the only traits of character, in which any confidence can be placed.

Age and Perseverance.—It is a fault too much practised by both sexes to indulge in listlessness, and a kind of hopeless languor, at the decline of life. Our energies and talents were given us to persevere to the end.

A Rule for Conversation.—We should be as careful not to offend unnecessarily, as not to mislead intentionally, those with whom we converse; and indeed to give unnecessary pain, by remarks in conversation, is not only a breach of manners, but of morals.

Evenness of Temper .- Madame Necker relates the following anecdote M. Abauret, a philosopher of Geneva. It is said of him that he had never been out of temper; some persons, by means of his female servant, were determined to put him to proof. The woman in question stated that she had been his servant for thirty years, and she protested that during that time she had never seen him in a passion. They promised her a sum of money if she would endeavor to make him angry. She consented, and knowing that he was particularly fond of having his bed well made, she on the day appointed neglected to make it. M. Abauret observed it, and the next morning made the observation to her; she answered that she had forgotten it; she said nothing more, but on the same evening she again neglected to make the bed; the same observation was made on the morrow by the philosopher, and she again made some excuse in a cooler manner than before. On the third day he said to her, "you have not yet made my bed; you have apparently come to some resolution on the subject, as you probably found it fatigued you. But after all it is of no great consequence, as I begin to accustom my-self to it as it is." She threw herself at his feet, and avowed all to him.

Wanted Immediately,

Six or eight Journeyman Chair Makers, at the Newburyport Chair Factory.—Cssh and the highest price given.—Apply to Nathan Haskell, Ageot for the Proprietors. Newburyport, Dec. 19, 1828.

NEW ENGLAND FARMER.

Published by John B. Russell, at No. 52 North Market Street, (over the Agricultural Warehouse). - Thomas G. Fessenden, Editor.

VOL. VII.

BOSTON, FRIDAY, JANUARY 9, 1829.

No. 25.

AGRICULTURE.

AGRICULTURE.

Written for the Conversation-Lexicon, by the Editor of the New England Farmer.

(Concluded from page 185.)

AGRICULTURE OF THE UNITED STATES.

The territory of the United States is very extensive, and presents almost every variety of soil and climate, which the earth affords. The agriculture of this wide spread country embraces all the products of European cultivation, together with some, (such as sugar and indigo) which are rarely made objects of tillage in any part of Europe. To give a full description of the agricultore of these states would require a large volume. We shall confine ourselves to such sketches as we may deem of most practical importance to those who are or intend to become cultivators of North American soil.

The farms of the Eastern, Northern, and Middle States consist, generally, of from 50 to 200 acres, seldom rising to more than three, and generally falling short of two hundred acres. Every farm is enclosed and divided either by stone walls, or rail fences, made of 'timber, not many hedges having hitherto been cultivated. The building, first erected on a "new lot," or a tract of land not yet cleared from its uative growth of timber is what is called a log-house. This is a hut or cabin, made of round straight logs, about a foot in diameter, lying on each other, and notched in at the corners. The intervals between the logs are filled with slips of wood, and the erevices, generally stopped with mortar, made of clay. The fire-place commonly consists of rough stones, so placed as to form a hearth, on which wood may he burnt. Sometimes these stones are made to assume the form of a chimney, and are carried up through the roof, and, sometimes, a hole in the roof is the only substitute for a chimney. The roof is made of rafters forming an acute angle at the summit of the creetion, and is covered with shingles commonly split from pine trees, or with bark pecled from the hemlock, (pinus canadensis.)

When the occupant, or "first settler," of this " new land" finds himself in "comfortable circumstances," he builds what is styled a "framehouse," composed of timber, held together by tenons, mortices and pins, and boarded, shingled, and clap-boarded on the outside; and often printed white, sometimes red. Houses of this kind generally contain a dining room and kitchen, and three or four bed-rooms on the same floor. They are rarely destitute of good cellars, which the nature of the climate renders almost indispensable. The farm-buildings consist of a barn, proportioned to the size of the farm, with stables for horses and cows on each side, and a threshing floor in the middle; and the more wealthy farmers add a cellar under the barn, a part of which receives the manure from the stables, and another part serves as a store-room for roots, &c. for feeding stock. What is called a corn-barn is likewise very common, which is built exclusively for storing the ears of Indian corn. The sleepers of this building are generally set up four or five feet from

is of but little value, the trees are felled in one of fire. the summer months, the earlier in the season the better, as the stumps will be less apt to spront, clearing, the better, particularly about the old and the trees will have a longer time to dry.— logs, where there is rotten wood.

The trees he till the following spring, when the

"The best time of the year to fell the timber, The trees he till the following spring, when the

If new land be in such a situation that its natural growth, may turn to better account, whether for timber or fire wood, it will be an unpardonable waste to burn the wood on the ground. But if the trees be taken off, the land must be ploughed after clearing, or it will not produce a crop of as were no. Sonsumed by the fire.

The following remarks on this subject are extracted from some observations by Samuel Preston, of Stockport, Pennsylvania, a very observing, experienced, and judicious cultivator; which were first published in the New England Farmer, an agricultural paper, printed at Boston, Massachu-

Previous to undertaking to clear land, Mr Preston advises :

"1st. Take a view of all large trees, and see which way they may be felled for the greatest number of small trees to be felled alongside or on them. After felling the large trees, only lop down their limbs; but all such as are felled near them should be cut in suitable lengths for two men to roll and pile about the large trees, by which means they may be nearly all burnt up, without cutting into lengths, or the expense of a strong team to draw them together.

"2d. Feli all the other trees parallel, and cut them into suitable lengths, that they may be readily rolled together, without a team, always cutting the largest trees first, that the smallest may be loose on the top to feed the fires.

"3d. On hill-sides fell the timber in a level direction; Then the logs will roll together; but if the trees are felled down hill, all the logs must be turned round before they can be rolled, and there will be stumps in the way.

may readily heap and burn most of the timber, endeavor to make the most of his land; the without requiring any team; and perhaps the American cultivator has the same inducement to brands and the remains of the log-heaps may all make the most of his labor. Perhaps, however,

the ground, on smooth stone posts or pillars, be wanted to burn up the old fallen trees. After which rats, mice, or other vermin cannot ascend. proceeding as directed, the ground will be clear With regard to the best manner of clearing for- for a team and sled to draw the remains of the est-land from its natural growth of timber, the fol- heaps where they may be wanted round the old lowing observations may be of use to a "first set- logs. Never attempt to either chop or draw a tler." In those parts of the country where wood large log until the size and weight are reduced by

"The more fire heaps there are made on the

limbs, which do not lie very near the ground in a great measure depends on the season's being should be cut off that they may burn the better, wet or dry. Most people prefer having the tim-Fire must be put to them in the driest part of the ber fallen in the month of June, when the leaves month of May; or if the whole of that month are of full size. Then by spreading the leaves prove wet, it may be applied the beginning of and brush over the ground, (for they should not June. Only the bodies of the trees will remain be heaped) if there should be a very dry time the after burning, and some of them will be burnt next May, fire may be turned through it, and will Those which require to be made burn the leaves, limbs, and top of the ground so shorter are cut in pieces nearly of a length, drawn that a very good crop of Indian corn and pumptogether by oxen, piled in close heaps and burnt, kins may be raised among the logs by hoeing; reserving such trees, and logs as may be needed after these crops come off, the land may be clearfor fencing the lot. The heating of the soil so ed and sowed late with rye and tunothy grass, or destroys the green roots, and the ashes made by with oats and timothy in the spring. It what the burning are so beneficial as manure to the they call a good burn cannot be had in May, keep land, that it will produce a good erop of wheat or the fire out, until it can be had in some very dry Indian corn, without ploughing, hoeing, or manur- time in July or August; then clear it off and sow either wheat, or rye and timothy, harrowing several times, both before and after sowing; for after the fire has been over the ground, the sod of timothy should be introduced as soon as the other crops will admit, to prevent briars, elders, fire cherries, &c. Com springing up from such seeds

"The timothy should stand some four or five years, either for mowing or pasture, until the small roots [of the forest trees] are rotten; then it may be ploughed, and the best mode which I have observed is to plough it very shallow in the fall; in the spring crossplough it deeper, harrow it well and it will produce a first rate crop of Indian corn and potatoes, and the next season produce the largest and best erop of flax that I have ever seen, and be in order to cultivate with any kinds of grain, or to lay down again with grass.

" These directions are to be understood as applying to what are generally called Beech-landsand the chopping may be done any time in the winter, when the snow is not too deep to cut low stumps, as the leaves are then on the ground .-By leaving the brush spread abroad, I have known such winter choppings to burn as well in a dry time in August, as that which had been cut the summer before."

The agricultural implements, and farming operations of the United States, are, in most particulars, very similar to those of Great Britain. Circumstances, however, require variations, which the sagacity of the American cultivator will lead him to adopt, often in contradiction to the opinions of those who understand the science better than the practice of husbandry. In Europe land is dear and labor cheap, but in the United States the reverse is the case. The European "4th. By following these directions, two men cultivator is led by a regard to his own interest to

this principle, in this country, is, generally carried to an unprofitable extreme, and our farmers would derive more benefit from their land if they were to limit their operation to such parcels of their possessions as they can afford to till theroughly and to manure abundantly. A man may possess whole as evidence of his title. He may cultivate well those parts which are naturally most fertile, and suffer the rest to remain woodland, or, having cleared a part, lay it down to permanent pasture; which will yield him an annual profit, without requiring much labor.

The climate and soil of the United States are adapted to the cultivation of Indian corn, a very valuable vegetable, which, it is believed, cannot be raised to advantage in Great Britain.* This field culture of the horse-bean (vicia faba) one of the most common fallow crops in that island .-The Root-husbandry, or the raising of roots for the purpose of feeding cattle, is likewise of less importance in the United States than in Great Britain. The winters are so severe in the northern section of the Union, that turnips can rarely be fed on the ground, and all sorts of roots are with more difficulty preserved and dealt out to stock in this country than in those which possess a milder climate. Besides, hay is more easily made from grass in the United States than in Great Britain, owing to the season for hav-making being generally more dry, and the sun more powerful in the former than in the latter country. There are many other circumstances which favor the Ameriean farmer, and render his situation more eligible than that of those who pursue the same occupation in any part of Europe. He is, generally, the owner as well as the occupier of the soil which he cultivates; is not burdened with tythes; his taxes are light, and the product of his labors will command more of the necessaries, comforts, and innocent luxuries of life, than similar efforts would procure in any other part of the globe.

The American public seem, at present, fully aware of the importance of emulous and scientific agriculture, to the strength and prosperity of a nation. The state of Massachusetts has appropriated considerable sums to add to the funds of Agricultural Societies in that Commonwealth. Institutions for the promotion of husbandry, Cattle Shows, and Exhibitions of Manufactures, are not only common in that State, but in every part of the Union. A periodical publication entitled the American Farmer, is established at Baltimore, and another called the New England Farmer, is published in Boston. Men of talents, wealth and enterprise have benefited their country and acquired the highest honor to themselves by their labors and their liberality to improve American husbandry. Merino sheep have been imported by Gen. Humphreys, Chancellor Livingston, and others, and are now common in the United States .-The most celebrated breeds of British cattle have been imported by Col. Powel, of Powelton, near Philadelphia; and there prevails a general disposition with men of intellect, influence, wealth, and high standing in community to promote the prosperity of American Agriculture, by all the means, which these advantages enable them to call into action.

notices of some of the most prominent benefits crop of grain." and improvements, which modern science has contributed to the art of agriculture. The husbandmen of antiquity as well as those of the middle, or what are called the dark ages, were destia large landed estate without being called on by tute of many advantages enjoyed by those who good husbandry to hack and scratch over the now pursue the same occupation. Neither the practical nor the theoretical cultivators of those periods had any correct knowledge of geology, mineralogy, chemistry, botany, vegetable physiol- by hieroglyphics. ogy, or natural philosophy; but these sciences have given the modern husbandman the command of some important agents, elements and principles of which the ancients had not the most distant idea. The knowledge of their writers was limited to methods of culture, which were sanctioned by experience; but the rationale of the practices entirely, and very advantageously, supersedes the they prescribed they could not, and rarely attempted to explain. Nature's most simple modes of operation were to them inexplicable mysteries, and their ignorance of causes often led to erroneous calculations, with regard to such effects as the cultivator is most sedulous to accomplish

We are indebted to modern science for the following among other improvements, viz:

Ist. A correct knowledge of the nature and properties of manures, mineral, animal, and vegetable; the best modes of applying them, and the particular crops for which particular sorts of manures are most applicable.

2d. The method of using all manures of animal and vegetable origin while fresh, before the sun, air, and rain, or other moisture has robbed them of their most valuable properties. It was formerly the practice to place barn yard manure in layers or masses for the purpose of rotting, and turn it over frequently with the plough or spade, till the whole had become a mere caput mortuum, destitute of almost all its original fertilizing substances, and deteriorated in quality almost as much as it was reduced in quantity.

3d. The knowledge and means of chemically analyzing soils, by which we can ascertain their constituent parts, and thus learn what substances are wanting to increase their fertility.

4th. The introduction of the Root-Husbandry, or the raising of potatoes, turnips, mangel-wurtzel, &c. extensively by field husbandry, for feeding cattle, by which a given quantity of land may be made to produce much more nutritive matter than if it were occupied by grain or grass crops; and the health as well as the thriving of the animals in the winter season greatly promoted.

5th. Laying down lands to grass either for pasture or mowing with a greater variety of grasses, and with kinds adapted to a greater variety of soils; such as orchard grass, (daetylis glomerata) for dry land; foul meadow grass, (agrostis stricta) for very wet land; herd's grass, or timothy, (phleum pratense) for stiff clavey soils, &c. &c.

6th. The substitution of fallow crops, (or such crops as require cultivation and stirring the ground, while the plants are growing) in the place of naked fallows, in which the land is allowed to remain without yielding any profitable product in order to have it recruit, or renew its fertility. Fields may be so foul with weeds as to require a fallow, but not what is too often understood by that term in this country. "In England, when a farmer is compelled to fallow a field, he lets the weeds grow into blossom, and then turns them down: in America a fallow means a field where the produce pose,-EDITOR.

We shall conclude this article with a few brief is a crop of weeds running to seed, instead of a

7th. The art of breeding the best animals and the best vegetables, by a judicious selection of individuals to propagate from,

These improvements, with others too numerous to be here specified, have rendered the agriculture of the present period almost as different from that of the ancients, as the art of printing is variant from the Egyptian mode of conveying ideas

HORN AIL IN CATTLE.

Mr Fessenden-In the month of April last, I had a cow taken with the horn ail, to that degree that she had nearly stopped eating, and from giving a large quantity of milk, had become nearly dry. I punctured her horn with a gimblet and injected vinegar, in which salt had been dissolved. It was soon evident that it was an injury. I then applied to an aged acquaintance, who has had much experience in doctoring animals, and stated to him the case and what I had done. He said "it was very wrong ever to make a hole in an animal's horn for that disorder, that a very simple medicine would cure it.

"Take of salt, one-half pint, of stone soot,* one-half pint, of black pepper, one table spoonful, make all fine, and give one, or two, spoonfuls at a time, night and morning. It is easily done by drawing the tongue out of the month with the hand, and putting the spoon as far down as it will reach, then let go the tongue and keep up the nose and it will all go down." I followed the directions, and in two days my cow was better; and in a week was perfectly well. The same may not cure in all cases of horn ail, as my informant said it would, but it is worth the trial.

FOR THE NEW ENGLAND FARMER.

INSECTS ON FRUIT TREES.

[Extract of a Letter from a cultivator in New Hampshire, to the proprietor of the New England Farmer.]

DEAR SIR-I have read with some interest the late communications in your paper, respecting insects on fruit trees. About two weeks ago, I collected specimens of several kinds in order to send them to Mr Fessenben, and also wrote a short communication for the Farmer. In this collection were pieces of bark from the apple tree, covered with rye shaped shells, such as those mentioned by Mr Perley. Also pieces of bark from one of the pear trees, which I received from Mr Prince's nursery, last spring, covered with white scales, enveloping the insect described by your correspondent " M."

The first that I discovered of the insect last mentioned, was, I think, in September. The tree was then covered from the ground to the ends of the limbs, with a white appearance. Upon close examination they appeared like seeds of fishes, adhering closely to the bark of the tree, and upon pressure of any bard substance upon them, they exuded a dark reddish substance, as described by "M." On removing the scales, the bark under

^{*} Mr Cobbett is, however, attempting to cultivate Indian corn in England, but with what success we have not learned.

^{*} By stone soot, we suppose is meant soot obtained from a stone chimney in which wood is burnt. Probably wood soot obtained from a brick chimney, would answer a similar pur-

them was deeply stained even quite to the wood. Soon after they were observed they were scrubbed off with strong soap suds, and a woollen cloth. The bark has remained ever since curiously mottled with green and brown - brown spots wherever the scales were, and green where there were no insects. They were dissimilar to Mr Perley's insect, and, I think, have no connexion with the coffee shaped, bristly insect, mentioned by " M." I think I saw some of the last named insect upon the leaves of a small apple tree, and upon a Spanish filbert last summer. They fed ravenously upon the leaves, eating them edgeways. I did not pay much attention to them at the time, but cut the branches off, and crushed them under foot. I have, within a day or two, closely examined the trees upon which I saw them, but can dead. find no appearance of scales."

pen of a respectable, judicious, practical cultivator, who has prohibited our publishing his name, attached to the communication. We regret this, for a good name adds value to a good article; and seems somewhat like giving a sanction to lime or ashes is to be well rammed round the The great farmer is placed in a state of higher good precepts by good examples.

they are not the same with Mr Perley's insect, or what we have often heard called the Bark Louse. we have before expressed, that the insect exuding a reddish substance, and the " coffee shaped, bristly insect" are not the same. Till the kinds of insects are discovered, and the specific remedies pointed out, we may as well use such means for destroying them as are most efficient for the des- ling at the bottom. truction of all sorts of animalculæ. They should be treated with lime water, tobacco water, solutions of potash, soft soap, quick lime in powder, ashes, tar water, spirit of turpentine, picked or scraped off by hand, &c. &c. These added to such judicious culture as may cause the plants to vegetate with vigor, will, generally, answer the wishes of the cultivator.

From the American Farmer.

FRUIT TREES AND VINES.

DEAR SIR. Kishacoquillis, Dec. 11th, 1828.

It is considered by most men, upon settling themselves permanently, an object of some importance to have good fruit on their farms and gardens, as soon as possible, and it has been common for those who src unable to come at nurseries of engrafted fruit for transplanting, to wait the bearing of seedling trees, or at least until they can have seedling stocks to engraft upon, and in either case it requires a period of ten or twelve years to elapse before a tree of this kind arrives at sufficient size to hear much fruit.

It is a fact which is not perhaps generally known, that the common white thorn, the erab apple, and the service or May cherry, make very good stocks for apples or pears, and may be found in great abundance in every part of our country.

By transplanting stock of the above kind in the fall, and engrafting them in the succeeding spring, we may have a handsome crop of fruit in four or five years, anticipating the usual period at least six or seven seasons.

PRESERVATION OF WOOD LOTS:

Wood should be felled or cut down between the months of November and March. This circumstance renders it better fire wood, and, some Among the animals, which are rarely domesti- say, more durable timber. And wood which is new its growth.

In applying the axe to a wood lot, which the owner would wish to perpetuate by a series of reproductions, the best method is to cut down every tree as far as you proceed. This will give the sprouts from the stumps, and other young trees the advantages of a free circulation of the air, and a fair exposure to the sun. But if some of the large trees are left, the shoots which spring up from the stumps of the others will languish beneath their shade.

That part of a wood lot, which has been cut over should be carefully fenced from cattle; which will otherwise destroy the young shoots by browsing on them. Care should also be taken to break off a part of the shoots around the stumps, leaving only two or three of the most thrifty. By such management, a wood lot might last for centuries and be a source of great profit and utility.

TRANSPLANTING FRUIT TREES.

How to set out Fruit Trees on a light soil. Dig a hole sufficiently large to prevent the roots of the tree, which is to be transplanted, from being doubled, or placed in an unnatural position, and to give room for the young shoots to extend themselves. Place about the roots of each tree, together with the mould, about half a bushel of small stones, the size of a common apple, or somewhat less, which will give stability to the soil, and prevent the roots from being loosened by the winds, which are so prevalent in our climate.

Another mode of transplanting fruit trees is thus described by Loudon: "Planting by mudding in is a German practice in planting fruit trees, particularly suitable to the dry sandy soils of that country, and sometimes adopted in similar situations in this country. The pit being dug out, the mould in its bottom is watered and stirred so as to form a mass of mud about half the depth of the pit; the tree is then inserted, and its roots worked up and down in the mud, so as to spread them as much as possible through it. More mud, previously prepared, is poured in till the pit is full, which is then covered with dry earth, raised round the stem, but hollowed in the middle, so as to form a basin round its stem, and finally covered with litter, and if a standard, it is fastened to a stake to protect it from winds. Diel, a scientific German author, assures his readers that trees planted in this way in spring, thrive better in cold situations than those planted in the ordinary way in the preceding autumn. He found it also particularly useful in the case of planting fruit trees in pots. Portey, alluding to this mode, says, " Planting in a puddle occasions the soil speedily to firm, not only too hard for the roots of the plant to spread, but also, so far as perfectly to exclude water." [This, however, we believe would not take place in a light sandy soil.]

" Planting by fixing with water is an excellent variety of the last species. It has been successfully practiced by Pontey, and is thus described by him :- The hole being made, and the tree placed in it in the usual manner, the root is then slightly covered with the finer parts of the soil: the tree being at the same time shaken, as is common, to settle the carth among its roots. Water is then applied by a common garden watering pot, by pouring it upon the soil with some force, in order to wash it close to and among the roots of the plant. But this can only be done effectually by elevating the pot as high in the hands as it can be conveniently used, after first taking off the nose.

apt to send forth sprouts or suckers; and thus re- It will be obvious that for such purpose a large pan, with a wide spout is to be preferred. The hole is then filled up with the remainder of the soil, and that again consolidated with water as hefore, which usually finishes the business. The foot is never applied, except in the case of bad roots, which sometimes occasion the plants to be left a little leaning. In such cases the application of the foot slightly, once or twice, after the soil has become somewhat firm, (which generally happens in less than an hour,) sets the tree upright, and so firm as to need no staking.

A paper " On the Management of Orchards," written by the Hon. John Wells, and originally published in the Massachusetts Agricultural Repository, states two successful experiments in planting trees in situations not naturally favorable to their growth. The writer states that, "It is more easy than is generally supposed to overcome many natural disadvantages, and an orchard may be brought forward and made productive in a few years, in a situation (when wished) not so favorable. To show this, two cases will be mentioned, which have been attended with good success.

" In the one, a low piece of strong stoney land was taken. As it was rather flat, it was ploughed in strips, or dug in spaces about four feet square. As it was necessary to plough a furrow between each row, the mode of ploughing in strips was found the best, as by turning the furrow towards the tree the land was better drained. Besides raising the ground a little from the surrounding soil, half a back load of loam was added to raise the ground on which the tree was set. After this was done, the strips or squares, as the case might be, were appropriated to the culture of potatoes and garden vegetables. In a few places only the trees failed from the insufficiency of the drain. But by opening the drain, and raising the ground by half a buck load of loam, I found on setting out a new tree, it flourished equally with the rest. This orchard now in eight years is a most valuable one, and most of the trees would give half a barrel of apples.

"From this and other circumstances, which have fallen within my observation, it appears that lowland, if strong and well drained, will give a fine orchard, and probably sooner than any other.

"The next effort was made under totally opposite circumstances. The object was to have an orchard on a particular spot, where the soil was thin and light upon a plain or flat. The holes were dug four feet over. The two upper strata of black and yellow loam were placed beside the tree. After this, about ten inches in depth of the gravelly or poorer earth was taken out and carted off, and a horse-cart load of stones upset in the hole; upon these, a part of the upper stratum, or some dirt from the side of the road, was scattered, so as to fill up the interstices, since which the spots near the trees have been cultivated by planting four hills of potatoes round each tree. The result has been tolerably favorable with all. But the trees having the stones at the roots have exceedingly outstripped the others."

A writer in the New York Daily Advertiser, declares from his own experience, that a strong tea, made of wood soot, drank freely, cold, is an unfailing remedy for Dyspensia.

A Mr Lawton, of Newport, Rhode Island, has are now in operation at T. Buffum & Co's Cotton | Mr Repton, the landscape gardener, gives numerous

Mill, in Northbridge, Mass. and are found to answer a much better purpose, with no labor at all than old fashioned wooden temples now in gen-

We give the annexed paragraph as we find it in the Baltimore American. Much anxiety will naturally be felt to learn something further of the plan and construction of a car affording the amazing advantage represented, and it would give us pleasure to be able to enlighten our readers upon the subject. Forty tons is a large load for a horse, and any road or car which allows him to exert that power, will be an invention surpassing that of the steam engine .- Penn. Gazette.

From the moment of the commencement of the Baltimore and Ohio Rail Road, we were strongly inclined to the opinion that the inventive genius of our countrymen would never be contented to follow the beaten track pursued in similar works, on the other side of the Atlantic. Accordingly, we have already had occasion to notice several new and valuable improvements in the construction of railways and rail road carriages; and, within the last month, the meritorious invention of our esteemed townsman, Dr Wm Howard .-We have now to speak of another invention of a railway car, the model of which has just been submitted to the directors of the Baltimore and Ohio Rail Road Company, by the inventor, Mr Ross Winaus, of New Jersey, and Mr J. L. Sullivan, civil engineer. The car is very simple in its construction, and seems so admirably to answer its intended purpose as to leave nothing to be desired on the score of facility of transportation .-Such, at all events, appears to be the opinion entertained of it by a number of gentlemen who witnessed its exhibition on Saturday. The model is capable of carrying 400 pounds weight. The effeet of its operation under the disadvantage of an imperfect railway, was five and a half times greater than is usual on the rail roads in England. A half pound weight led over a pulley, drew 460 pounds, exclusive of the carriage, which weighed 100 pounds. In England it is considered that one pound is the power requisite for drawing a load of 200 pounds. In the present instance, one pound to 1144 pounds was the ratio of the power to the load; and it is expected that on a large scale, a still greater advantage will be gained .-With this car a horse will be able to draw upwards of 40 tons, instead of 81 tons, by the ordinary mode. The ear has also other properties which we understand have a tendency to lessen the expense of the unavoidable curves of a railroad. The model will remain in this city for some days, so that all who feel a desire to examine it, may have an opportunity of doing so. It will probably be removed to the Exchange in the course of to-day.

EFFECTS OF IVY ON TREES.

' It appears to be a vulgar prejudice that ivy kills the trees it clings to. It it rooted itself, as is erroneously supposed, in their bark, and fed upon their juices, it might merit the accusation of a destroyer: but it derives its nourishment wholly from the ground, where it is rooted; and the supposed roots are only tendrils or holdtasts to enable it to climb. The opinion of its injuring trees seems to have arisen, (and very naturally too,) from the fact it prefers to climb up a dead or dying branch, and invented a new kind of temples, a pair of which will not attach itself to very young wood at all.

facts to show that trees overrun with ivy, so far from being injured by it, grow most Inxuriantly. Evelyn says, that when the ivy is stripped from trees, they are often killed by cold in the ensuing winter .- American Farmer.

CONTEMPLATED HORTICULTURAL SO-CIETY.

We fully concur in opinion with the writer of the following able article, from a respected correspondent, that a Society for the promotion of skilful and scientific Horticulture, established in Boston, would greatly subserve the interests of the community, as well as furnish avenues to laudable distinction, and pure and praiseworthy enjoyment to the members of such an institution .-A number of persons associated for a desirable object, may furnish an aggregate of mind and means, which is much more effective for beneficial purposes than would be the isolated efforts of the same individuals. A HORTICULTURAL So-CIETY might introduce new and useful plants from various quarters of the globe; import valuable and expensive publications, as well as form a Repository for new and useful Implements, which would be beyond the powers of more numerous and wealthy persons to accomolish without acting in concert.- EDITOR.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

The influence that has been so generally diffusricultural Societies, is felt and acknowledged to be of immense importance to the interests of the culproduce of his labors. Whatever has a tendency to promote this honorable, and useful, and independent branch, of domestic industry, should be fostered and regarded.

community, and which is not confined to the citi- islands of the sea, who are constantly transmitneighboring towns and villages. We have witnesand ardent efforts of our citizens in this peaceful, replete with information for horticulturists, and tofore.

not be unmindful of the pleasure afforded, by the TON was an active corresponding member. display of the rich dessert, with which his table is crowned. And the public will view with complacent regard, the attention bestowed upon this branch of the "American System," which needs no public act of doubtful expediency, to insure its protection.

It cannot be expected that in our northern climate, we should produce even by untiring assiduity, or extensive outlay, all those fine varieties of fruit, which are yielded spontaneously, or with comparatively little labor, in some sections of our highly favored country. Under all discouragements Extract to the Editor of the American Farmer, dated however, it must be admitted, that much has been achieved, and under the continued auspices of Heaven, and our native industry and perseverance, we may continue freely to enjoy the healthy, and invigorating pleasures of the cultivator, and share the bounties a benevolent Providence awards to the labors of man.

more extensive and active exertions? To those the Royal Court of Paris, and a member of the who have been the modern pioneers in the resuscitation of this primitive employment of a portion fineness of merino wool. SHEPHERD'S DOGS.

FROM GENERAL LAFAYETTE. LA GRANGE, August 9, 1828.

MY DEAR SIR-The session of the Chambre du time of the vacation.

Who then among us is to give the impulse to from my colleague, M. Girod de l'Ain, Judge of association of Naz, the celebrated flock for the states also, I think the information therein coumer. You have mentioned to me the Pyrennian breed of dogs; I have procured two puppies, one of them, as both are males, I shall send when more fit to bear the voyage."

The puppies arrived safely, and are of immense breed which is used to destroy wolves and sheep-The citizens of Massachusetts have never been killing dogs. The treatise is entitled, "Manual to what we have published, and shall publish in New York, Philadelphia, and some other of our our next, we shall insert it as soon as convenient.]

Si'k Exports .- A correspondent predicts that this country will export the raw material of this article, within a few years after our attention is well directed to its culture, to an extent somewhat This important Society which has done so comparative with that of cotton. France, he says, imports one third of the raw material she manufactures, and she would become our best customer. -National Intelligencer.

> The Season .- The Georgia Journal of the 15th December says, thus far, the thermometer has indicated summer heat, within a degree or two. Although the same remark will not apply to our latitude, yet we believe the oldest inhabitants have seldom seen so mild and open a winter; for all the purposes of out-door business the weather is as fine almost as is common in October; not an inch of snow has fallen.

The Penobscot was closed by ice the 18th inst: -Newburyport Herald.

Blistered Feet .- The following mode of cure, was communicated to Capt. Cochrane, and which he says he never found to fail :- " It is simply to rub the feet at going to bed, with spirits mixed with tallow dropped from a lighted candle into the palm of the hand. On the following morning no blisters exist: the spirits seemed to possess the healing power, the tallow serving only to keep tho skin soft and pliant. The soles of the feet, ancles, Large Pear .- At a late meeting of the Royal and insteps, should be rubbed well; and even where no blisters exist, the application may be usefully made as a preventative. Salt and water is a good substitute-and while on this head, I would recommend foot travellers never to wear right and left shoes; it is bad economy, and indeed serves to cramp the feet; and such I felt to be the case." - Cochrane's Pedestrian Tour.

[From Fessenden's New American Gardener.]

JANUARY.

Throughout New England the temperature of Deputes is at an end, and I am returned to La the climate is such as to exclude the cultivator Grange, where I hope soon to reunite the greatest from performing most of the operations of tillage part of the family, including our three boys for the or horticulture from about the first of December to the latter part of March, or the beginning of April. You will have received a letter, inclosing one The seeds of knowledge may, however, be sown

in winter, and the horticulturist may cultivate his mind when his soil is bound in frozen fetters.

Provide a sufficient quantity of bean-poles, and pea-rods, which you may preserve in a corner of your wood-house, or other place suitable for your purpose. Many people, who neglect to procure these implements in season, are induced, by the hurry of business, to permit their peas and beaus to trail on the ground, in which situation they will recommended by Sir John Sinclair's Recipe .not produce, especially the tall growing sorts, one third part so many as if they were properly sup-ported by poles and rods. The length of your pea-rods should be in proportion to the sorts of of rods, which the tall-growing peas require, will answer for the generality of running kidney beans. The Lima beans will need strong poles, from eight to nine feet high. You may now make preparation for forcing cucumbers, melons, cabbages, radishes, lettuces, cauliflowers, &c.

BRITISH GRASSES.

The late Mr Curtis had squares of live turf sent him from all parts of the empire-particularly from pastures famous for their richness, and these he cultivated with care, for the purpose of comparison, and discovering the sorts of grasses, upon which the rich quality of the pastures, whence they were taken, depended. A comparative view of our British grasses of a similar kind may be seen, we are informed, at the nursery of Messrs. Connack and Sinclair, New Cross, near Deptford -a field being appropriated for the purpose of growing patches of all the agricultural grasses. From the high character of one of the partners, Mr Sinclair, author of "the Hortus Gramineus Woburnensis," in this particular line, this grassfield must be a very interesting sight to agriculturists and graziers, as well as to botanists.

TRANSPLANTING EVERGREENS.

The unfading verdure of the resinous trees forms a pleasant relief to the eye amid the desolate fields and snow-crowned hills of winter. These beautiful inmates of the northern forests, are peculiarly intractable to the skill of cultivation. The spruce and the fir, when removed from the cold and bleak solitudes where they best love to fix their roots and send up their tall pyramids of green, to a more genial situation, wither and perish. These beautiful and stately plants are desirable as the ornaments of the garden or the groves of cultivated secnery. The English books recommend that they be removed in the depth of winter with frozen masses of earth around their roots, to holes dug for their blister, according to circumstances, and recomreception during the preceding autumn. By this simple process, it is said, they may be transplanted without injury, and flourish in their freshness as if Glasgow Medical Journal. still clinging to the rock or rising in the waste.-National Ægis.

VALUABLE RECIPE.

In the Memoirs of Count de Segur, (Vol. I. p. 168,) there is the following anecdote: "My mother (the Countess de Segur,) being asked by Voltaire respecting her health, told him that the most painful feelings she had, arose from the decay of her stomach and the difficulty of finding any kind of aliment that it could bear. Voltaire, by way of conversation assured her that he was once nearly for a year in the same state, and believed to be incurable; but that, nevertheless, a very simple no other nourishment than yolk of eggs, beaten up gium .- London pa.

with flour of potatoes and water." Though this circumstance took place as far back as about fifteen three years old in May last, was slanghtered a years ago, and respected so extraordinary a per- few weeks since, by Mr Edmund Brownell, of sonage as Voltaire, it is astonishing how little it is Little Compton, R. I. which weighed 1195 known, and how rarely the remedy has been pounds. practised. Its efficacy, however, in cases of debility, cannot be questioned, and the following is the mode of preparing the valuable article of food, as Beat up an egg in a bowl, and then add six table spoonfuls of cold water, mixing the whole well together; then add two table spoonfuls of the farina of potatoes, mixing it with the liquor of the peas for which you intend them. The same kinds bowl. Then pour in as much boiling water as will convert the whole into jelly, and mix it well. It may be taken either alone or with the addition of a little milk, and moist or best sugar, not only for breakfast, but in cases of great stomachic debility, or in consumptive disorders, at the other meals. The dish is light, easily digested, extremely wholesome and nourishing. Bread or biscuit may be taken with it as the stomach gets stronger.

> Singular effects of Light and Darkness-A plant, which is not uncommon in India, the Cotyledon calycina changes its properties very remarkably, according to the period of the day and night. Upon the whole, the plant may be said to possess an herbaceous taste, but in the morning it is as much, if not more acid, than sorrel, probably from its imbibing oxygen during the night. As the light continues to act upon it, the oxygen appears to be disengaged as it loses its acidity, and about noon becomes nearly tasteless. Towards evening it becomes bitterish, and sour again in the morning. This plant, we are told, may be seen at Loddige's Nursery, at Hackney, and in some other collections in England.

> Mr Brown of Glasgow, has published a paper on what he calls the disorder of the spinal nerves, which, though not uncommon, particularly among females and persons of feeble conformation, seems to have hitherto been overlooked, unexplained, or confounded with rheumatism, &c. The disorder usually manifests itself by a sort of bruised gnawing pain, or rather a relaxed weariedness, in some part of the chest, sometimes over the stomach, and sometimes in one of the sides, &c. In such cases the seat of the complaint may be traced to the spine, by passing a sponge dipped in hot water down the back, when the part affected will be found to be tender. Here Dr Brown applies leeches, or a small mends being in a horizontal position. This disorder is not uncommon among literary people.-

> A writer in Poulson's American, Philadelphia. recommends that the currency of the country be regulated: all the foreign coins called in and passed through the mint; clipped money declared uncurrent, &c. These suggestions are worthy of consideration.

> Nearly 20,000 loads of wood have been transported on the Delaware and Hudson Canal. principally to the New York market.

Fruit.-The art of improving the quality of fruits by crossing the various sorts, is said to have been unknown until nearly the close of the remedy had restored him. It consisted in taking last century, when it was first attempted in Bel-

A steer, of the short horned Durham breed.

The last number of the North American Review, contains articles on the following subjects: The Decline of Poetry-Scandinavian Mythology, Poetry, and History - Austin's Life of Gerry Biography of a German Carbonarist-Flint's Geography and History of the Western States-Irving's Life of Columbus-The Epistle to the Hebrews-Hayti-The Baltimore and Olio Rail Road-Heeren's Historical Works-Simon Bolivar-Saxe Weimar's Travels-Quarterly List of New Publications .- Published quarterly, at \$5 per annum, by Frederick T. Gray, Washington Street, Boston, and G. & C. Carvill, New

MISCELLANIES.

The following elegant lines are from the pen of the highly gifted and, accomplished Lady, who conducts the "Bower or TASTE;" a publication so well known, and whose merits are so bighly and generally appreciated, that any recommendatory notice from us would be useless supererogation.

AUTUMN.

I know 'tis bright-'tis beautiful !-but yet I ne'er could look on Autumn's golden leaf, Her robe of changeful dye, and not regret Thát vernal loveliness should be so brief.

Who sighs not over summer's fading rose ? Although around as other flowers are wreathing, Whose besoms richer, gayer tints disclose, And with whose fragrance every gale is breathing.

Still, the fatr flower, to young affection dear, If once enshrined within a faithful breast, Oh, never to the heart that loved sincere, Can other blossoms be so fundly press'd.

Yet when the garden's loveliness is past, We look upon the forest's towering pride, Which, though we know too soon must meet the blast, We breathe a fervent wish to hope allied-

That soft Favonian gales, with gentle breath, And genial sups the fading scene may cheer, Arrest awhile the chilling shafts of death, And sigh a requiem o'er the closing year!

Oh! there's a desolation wild, and bleak, In winter's dread approach: our bosoms feel A paralyzing chill, we cannot speak, Cling round the heart-o'er all its pulses steal;

"T is nature's death we look on; each cold blast Sounds as the knell of some departed joy; The ruthless conqueror o'er each scene hath past, With mighty arm commission'd to destroy! AUGUSTA

COURAGE.

Lightning was in his eye. His step was firm, But stealthy as a tiger's, and his limbs Stirr'd like the springing steel. His left hand held The instrument of death, and on his breast Th' insignia of his deadly trade were crossed. Look! he has marked his victim, and his form Stoops to a keener gaze. On-s'tp by step! Near-and still nearer !- It will answer now! Slowly he raises up his sinewy form, And stands a giant. Dreadfoly minute His deadly preparation—all is done! A momeni-a keen flash !- and to the ground Fails the unconscious-robin !- Hail! brave man.

A correspondent censures the mean, unmanly practice of making a butt of old maids. habit is an unequivocal sign of a vulgar and illregulated mind, and is most offensive and revolt- vast quantity of gas from the interior of the body ing to every person of feeling and delicacy .-Many of these females who lead single lives have that luminary, produce that bright and dazzling been influenced in their choice by motives equally creditable to their judgment and moral character. A woman may be amiable, accomplished, and admirably suited by nature and education to fulfil the duties of a wife and mother, and yet she may never have been seriously addressed by the man for whom she could feel the attachment and respect without which marriage is a state of insupportable thraldom. It is so much the fashion to look mainly to wealth in the choice of a wife, that very many most excellent women are neglect- lighter spaces, land covered with snow. Those

disposition and good principles are the best dowry centre, he thinks, are distinguished volcanoes, as that a woman can confer upon her husband .-London paper.

The following, which is copied from a Nuremburg paper, is an ingenious mode of preventing Sunday tippling. It is an order from the mayor of the department of Iserre ;- " All persons drinkiog upon Sundays and holy days, in coffee-houses, &c. during the celebration of mass, or vespers, are hereby authorised to depart without paying for what they have had."

Fraud in weighing meat in the streets by steelyards .- One day last week, a gentleman purchased from a wagon in the street, two quarters of pork, the apparent weight of which, by the vender's steelyards was 22 lbs. for one, and 26 for the other, both amounting to 48 pounds. The purchaser doubting the correctness of the weight, had the pork reweighed in scales in a neighboring store, when it appeared that one quarter weighed but 173 pounds, and the other 163 pounds, amounting to 345 pounds-making a difference of 131 pounds, as weighed by steelyards and scales! We give this statement that the public may be on their guard in respect to false steelyards and fraudulent venders of meat.

Several half-nile sections of the Baltimore and Ohio rail-road are already finished, and waiting for the rails. In excavations through the hills immense beds of mineral paints have been found, principally of Spanish Brown of a rich quality, and of value sufficient to defray much of the expense of excavation. It is probable that immense mines of wealth might be found in rail road excavations between this city and Worcester, in the shape of beef, potatoes, turnips, coal, butter, cheese, &c. &c.—Boston Palladium.

Spots on the Sun .- An ingenious individual in Providence, has very recently succeeded, by means of a seven feet telescope, constructed by himself on a new principle, in bringing the entire image of the sun into a dark room, upon a white screen, to the size of 8 feet in diameter. He writes us that his astonishment was great, when he perceived that every spot now upon the face of the sun, nine in number, was distinctly transferred to the screen, and was so plain that he could see every movement of them in their various and sudden changes. He says he could plainly discover that those spots were immense bodies of smoke, apparently issning from volcanoes; and as they seem occasionally forced upward from the craters, now forming dense clouds, and now dispersing, considers those phenomena as accounting for the rapid changes of those spots. The escape of such a of the sun, would, he observes, as it surrounds appearance, which is the atmosphere of the sun. This theory may not accord with the opinions of others who have made observations on the subject; but the writer, at any rate, entertains the strongest belief of its truth.

With the same instrument, which is but just finished, he has also examined the moon, and states his conviction that that body is covered with perpetual snow and ice-the dark spots discoverable on its surface being frozen seas, and the ed, by men who are not aware that an amiable circular places, which have a rising cone in the

no clouds are perceptible over the moon's face; which being covered with snow and ice, accounts, as he imagines, for its clear atmosphere, or for the absence of an atmosphere. This vast accumulation of ice and snow upon the moon's surface, may be explained, the writer conjectures, by the nature of the moon's revolutions. He offers to construct instruments of the above description, by which these phenomena may be observed, at \$50 to \$100; and at the same rate to furnish solar microscopes, on a new principle, with a magnifying power at 12 feet distance, of 5,184,000 .- Bos.

Twelve hogs, all of one litter, one year old, were sold in Pawtucket, R. I. on the 23d ult. which weighed when dressed 4236 lbs. This pretty litter came from Connecticut.

Orchard Grass Seed.

Just received at the New England Farmer Seed Store, No. 52 North Market Street, Boston.—a consignment of prime Orchard Grass Seed, raised by Mr LLOYD JONES, of Pennsylvania, who is well known as the most extensive and successful cultivater of this valuable grass in this country, as the follow-

ing letter shows:
"MR Russell,—In regard to the character of Mr Jones" seed, have pleasure in saying, that it is the best in this market, and nitways commands an extra price. Col Power, always purchases of him, not only for himself but for his southern friends; and the Pennsylvania Agricolural Society, at their last exhibition, awarded him the premiums for both Orchard Grass and Clover Seed.

JOHN P. MILNOR, Yours, &c. Recording Secretary Penn. Agri. Society.
Gentlemen who wish to secure a supply of this seed, will do

Well to secure it soon.

Also, a most extensive supply of Garden, Field, and Flower Seeds, raised expressly for us, or procured from the most unquestion; blc sources.

Canary Birds.

For Sale, a few copies of the New and Complete Canary For Sale, a tew copies or the New and Complete Capacy Brid Fancier, containing a variety of useful information, by which the admirers of those beautifel Birds may be instructed their management while breeding, and their treatment when diseased; with useful Hints to the breeders of Mules. From the latest London Edition. Price 25 ets. Just received at the Agricultural Warehouse.

Mo. 52 North Market Street, Boston.

Valuable Real Estate, &c, For Sale. The Subscriber offers for Sale, the following Real Estates in Darham, N. H. viz:

About 50 acres of land, under good cultivation, with tolerahe buildings thereon;—Soil of excellent quality, and capable of a high degree of improvement. Also, a Farm on the New Hampshire Ternpike road, containing about 80 acres, with

buildings nearly new.

Also, a Farm of about 110 acres, with new buildings, lying within two miles of the New Market Factories.

Also, a small Farm lying in the Great Bay containing 30 or 40 acres, a very productive and excellent tract of land, in the neighborhood of the above named Factories.

Also three Houses in the Village of Dorham—one of them possessing excellent accommodations for a Tavern.

Also, a Farm in Lee, containing about 80 acres.
Also, a Wood Lot in Barrington, containing 105 acres, well

He also offers for sale, a Stud Horse of approved blood, and several Mares and Colts of different ages.—All kinds of Farming Utensils, and Stock of all sorts.
The above described Lands are within a short distance of the

large Factory Establishments at Dover and New Market.
Durbam, Dec. 26, 1828. JOHN FROST. Durham, Dec. 26, 1828.

Two Heifers For Sale.

Two Superior Heifers, with calf, mixed between the Denton and Coelebs breed. Both of which took a premium at the late. Show in Brighton.—loquire of Daniel Chandler, Lexington, or at the coonting room of the New England Farmer, Agricultural Warehouse, Boston. 3t Jan. 2, 1829.

The Hunterdon Gazette Establishment for sale, At Flemington, Hunterdon county, New Jersey, on reasonable terms. Address the Editor, (post paid) at Flemington, New Jersey.

"With respect to a CANAL, your Committee retraffic on a railway; while nearly the same pro- | fer to the able Report of the late Board of Canal Commissioners communicated to the Legislature on the 11th of January last. By that Report, it appears that the only route for a Canal between to fifty tons, since this article was written to Boston and the Hudson river would be 178 miles ninety-four tons] which have been tracked by the in length-would require one thousand nine hunsteam wagon, or of thirty tons and upwards, dred and fifty nine feet lockage between Boston which have occasionally been moved by the horse and the Connecticut river-one thousand three hundred and $22\frac{34}{100}$ feet between that river and value of the economy of time is measured and horse weighing ten cwt. conducted by only one the Hudson, amounting to three thousand two proved by the vast exertions used and sums ex- man, upon a well constructed level edge railway, hundred and eighty-one 34 feet Lockage, and a pended in Britain to accommodate the public, and will work with ten tons of goods. In the same TUNNEL of at least four miles in length, through the ample harvest reaped by those, who best ful manner we may take thirty tons as employing the Hoosack mountain. The work of forming a Tunmen, which can be employed at a time. And it is easy to show from the progress made in other works of the kind, that many years would neces-

sarily be required to complete it.

"But even if a canal were constructed upon the proposed route, your Committee are unanimous in opinion that a Rail Road would be far more useful to the public. And their opinion in this respect is corroborated by Mr Tredgold, who states, Prince's nursery, last spring. The tree was very were adjudged to possess a capacity for weighing that for new works Rail Roads will in nine cases thrifty, and arrived in good order. I examined it when fatted—the one 700 lbs. the other 775 lbs. out of ten be better adapted for public benefit than at the time of transplanting, and discovered no They were taken into my cow pastures, which, canals.' If this is true in England, where, from the mildness of the climate, a canal is seldom closed by frost; and upon an average not exceeding seventeen or eighteen days in a year, how much more preferable must a Rail Road be in all our Northern States, where a canal is closed upon an average, one hundred and forty-five days in a year."

The following summary view of the superior advantages which Railways possess, when compared with Canals, is extracted from an able paper, originally published in the Boston Patriot, by a writer with the signature " Middlesex."

The Railway requires but one third the quantity of land that is required for a Canal, exclusive of ponds, reservoirs, and feeders.

The Railway requires one man and four horses to transport fifty tons 4 miles per hour.

The Canal requires two men, one bey and two horses to transport 30 tons 2 miles per hour.

The Railway may be attended and kept in repair for one tenth that of a Canal.

Railways give the greatest possible facility to travellers, Canals retard them.

Railways may be easily passed in all places required, Canals only by bridges. ,

Railways interfere with ne water privileges, Canals destroy many.

Railways are subject to no interruptions, except by snow, which is easily removed.

Canals are subject to be interrupted by droughts,

flood, frosts, leakages and locks. Railways carry their freight to the doors of the warehouses, Cauals deliver their freight upon the wharf.

A Railway can be constructed for half the cost of a Canal per mile.

A Railway may be used twelve months in a

year, a Canal but seven months. The toll of passengers will pay the interest on

the cost of a Railway. The toll of passengers on a Canal is very triffing. Half the common rates of tolls on a Canal will be sufficient to pay the whole expense of transportation on a Railway, including the toll.

Mountainous countries are easily surmounted by Railways, Canals can never get over them,

Rivers and streams are much more easily passed by Railways than they can be by Canals.

Railways will be the pride of New England; they will unite its inhabitants in one common centre, connect them in one common interest, and raise them to eminence and glory by one common operation. (To be continued.)

ON SHIFTING CATTLE.

J. S. SKINNER, Esq.

Sir-I do not know that any writer in your paper has remarked on the astonishing effect produced by shifting cattle from lands of poor quality and short feed, to those of fertile soil and rich grasses. My experience is worth something on this point, and I wish to put it on record for the benefit of my countrymen.

sheep, I sold sixty of the poorest quality, the small, diseased ones, for one dollar per head, to a immense quantities from these small cuttings, may gentleman living about five miles from nic. Our be thus annually propagated, by the help of the full land was quite different in its quality. Mine was sized single hand-glasses! This process, howeva thin, worn-out soil, producing nothing but rye; er, will not extend to any other description of his was high and very rich land, covered with a plants than the evergreens. thick growth of white clover. At the next season of shearing, I took pains to be at his pen. The luded to by this process, it must be recollected, whole sixty sheep purchased of me had lived that the sand is to be considered as no farther through the winter; their produce per head was essential, than to strike or promote growth in four pounds of clean washed wool, about three the cuttings, sufficient for transplantation; as, times as great as that of the preceding year; and on their being removed into another situation, in He has at various times since purchased the refuse requisite.

of my flock, and his example has been imitated by from which the green lice are hatched, that are his neighbors in both cases with the same success. I have old worn-out ewes renovated by this shift

The same effects result from shifting the pasthough a thin soil, were considerably better than had an ear of corn, nor root, from the time I purchased them till their death. I kept them two having but 60, the other 78 lhs. of tallow. If Probably Mr Prince, of Long Island, is well ac- those who reside on the rich soils of Pennsylvania will buy, every two years, from the starved herds of New Jersey, they will realize more profit than by any other mode of raising stock.

Philadelphia, Nov. 26, 1828.

T. J. R.

ON THE USE OF SAND

In propagating Trees, Shrubs, and Plants, from cut-tings of them. By Mr THOMAS HAINES, of Oundle, Northamptonshire.

" The finest white sand is superlatively useful to autumnal planted cuttings of the more tender evergreens and shrubs. In the business of planting cuttings of these underhand-glasses, in the autumn, as well as the more hardy green-house plants, such as myrtles, faschia, roses, cistuses, germander, &c., no unmixed soil whatever can be found to bear a comparison with the finest white sand; as cuttings planted therein will be far more secure from mouldiness throughout the autunmal and winter seasons; during which times, the pots in which they are planted, generally remain standing up to their rims in the common ground, as the greatest preservative from frost; but in which situation they are more exposed to the ill effects of damp, than if standing on the sur-

"Although but little more than a knot, or a swelling protuberance, at the foot of each cutting, can be effected, during the first autumn; yet, on the advance of spring, they will early make roots, even without the addition of any other soil or article to promote their growth; and which young In July, 1820, my farm being overstocked with plants, being potted off, or transplanted in some way, as soon as they have formed sufficient roots;

" In the propagation of the trees and shrubs al-

"We are not asserting that yellow sand will not equally apply in both cases, of planting cuttings of hardy evergreen trees and shrubs, both by summer planting, in the open exposure, and autumn planting, under hand-glasses; but in all the experiments we have witnessed, and throughout the whole of our own practice, white sand, where it could be obtained, has been invariably applied, and most successfully.

"When we reflect, that mouldiness is the chief annovance to cuttings of almost every description when planted under hand-glasses; every propagator should strenuously guard against it: and we know of nothing so likely to discharge wet, and prevent undue retention of moisture, as sand alone; and this, in preference to every other seil and compost.

"There are few soils with which sand cannet be intermingled to the greatest advantage in the various other branches of horticulture, as well as in the propagation of plants and flowers; it being admirably adapted, from its loose and open nature, to expand the pores of heavier, more close, and adhesive soils, thereby opening the entire mass of compost, and rendering it porous, and open to the free admission and full expansion of the delicately fine, and thread-like roots of plants and flowers; and in which we have most satisfactorily witnessed its singular and superior efficacy! We have known in various cases, plants to have been placed in soils most opposite and ungenial to their natures and constitutions, and thereby early inclining to decay; but which were speedily restored to their original vigor and complexion, by a proper and timely application of white sand.

"The sand which has invariably been found to surpass all others for general and special purposes in horticulture, is a peculiarly soft and fine white sand, of an unusual smoothness, nearly as fine as

flour-emery.

"Where none other than the common white sand, which is unusually coarse, can be obtained, small quantities of the most fine can be sifted out with a fine sieve. [Or still better procured from it by a little washing over .- Ed. Tech. Rep.]

"Little argument can be necessary to convince the unprejudiced florist, gardener, or amateur, of the general utility of suitable sands being mixed with the more cold and heavier soils; thereby rendering them open and porous to discharge all copious falls of rain, dissolving snow, &c., and which tend to overcharge adhesive soils with an undue proportion of moisture, and thereby to chill and starve the stock of plants and flowers."-Tech. Rep.

FOR THE NEW ENGLAND FARMER.

INSECTS ON FRUIT TREES.

MR FESSENDEN-Among the many useful subjects, which have appeared in your paper, the one relating to "Insects on fruit trees" has been particularly interesting to me; having for a few years past, by way of pleasing amusement, turned my attention to the cultivation of a few choice kinds. But as we find few pleasures without some alloy, so I have, in common with my fellow cultivators, experienced some drawback from the satisfaction which would otherwise have been enjoyed, in consequence of the various and destructive, though sometimes minute enemies which attack most of our trees, and almost threaten to destroy our hopes.

laws to prevent unruly boys and others entering our enclosures and pilfering our fruits; and this is all very well and necessary; but I undertake to say that we lose more in one season by those depredators which no laws will intimidate, nor arm of justice reach, than is lost in fifty years in the way just mentioned. Hence I think that all investigation which may lead to an extermination, or even mitigation of the evil, is exceedingly desirable, and I hope, as the subject is introduced in your useful publication now, while our common enemics have gone into "winter quarters" and given us time to rally and prepare for a new attack, it will be desirable that our efforts should be combined, and for this purpose that those who have made discoveries of the origin, or best mode of extermination of our cruel foes, should freely communicate the information for the benefit of the common cause.

In one communication in a late number of the Farmer, reference is made to a "rye shaped" insect which is found on the apple tree. This kind I have been troubled with for two or three years past, on a choice apple tree in my garden, and it seems they do not, like some other insects, make their appearance anew every year, but when once they have got foot hold they go on increasing from year to year, and probably would eventually destroy the tree entirely. I have tried the application of strong soap suds, &c. without effect in this case, and as the only effectual remedy have proceeded to scrape the bark until I had dislodged them. They might indeed be destroyed with less labor perhaps by the application of a strong solution of Potash, but as there is danger I think of injuring the huds and tender limbs to which the insects cling, I have preferred the method which I have adopted; perhaps, however, upon a larger scale, a less tedious course may be found as efficacious.

Another correspondent in your last number, mentions an appearance on one of his trees in September, which resembles "fish scales closely adhering to the bark, from the ground to the ends of the limbs." The same appearance I have noticed for the two last years upon a Mountain Ash tree. The first year I neglected to attend to this tree until the following spring, when the "scales" were pretty easily washed off with strong soap suds, and I noticed no appearance of them for the remainder of the season, until late in the fall, when I proceeded to scrape them from the bark, which may very easily be done with a small stick or other simple means. I have not yet satisfied myself whether this is an insect, as your correspendent thinks, or a disease of the tree making its appearance upon the surface. If the former, I think they must have been deposited on the tree early in the season, as there was no appearance of them on the wood of the previous year's growth. Another circumstance is, that, in both years they have appeared only upon one of two trees which are planted within about a rod of each other, and while the infected tree has for three or four years hardly increased in size, the other, with no better advantages has nearly or quite doubled, which leads me to suspect it may be a disease, for why should an insect attack one tree two years in succession, and leave the other untouched. At any rate there is evidently a connexion between this appearance whatever it may be, and the want of vigor in the tree, but whether it is the cause or half a pint of the medicine.

We apply to our Legislature, and they make the effect of that want of vigor, I am yet at a loss to determine. These trees, when planted a few years since, were of equal size and equally thrifty in appearance.

I have no doubt that the application of soap suds, &c. will be effectual in destroying most of the insects which infest the bark of our trees; but if their origin could be sought out, perhaps some easier and more expeditious method would be equally effectual.

I intended to have said something respecting other kinds of insects, as well as the alarming disease which has, particularly of late, appeared among our peach trees, but as this communication is already longer than I intended it should be, I will reserve my remarks for a future opportuni-Yours respectfully,

Charlestown, Jan. 13, 1829.

FOR THE NEW ENGLAND FARMER.

BUDDING FRUIT TREES.

MR FESSENDEN-In the 2d vol. of the N. E. Farmer, page 353 is a communication from Mr C. HARRISON, describing a mode of budding fruit trees, that he had practiced, somewhat different from any I have ever seen described. It is budding from cuttings taken from bearing trees in February, and preserved until wanted, in the same manner as if intended for grafting-the buds to be inserted as seen as the sap flows sufficiently free in the spring to perform the operation. Mr H. observes that he has only attempted budding apples and pears in this manner, but thinks it will succeed equally well with stoned fruit. If the above mode of budding fruit trees has ever been tried by any of your subscribers, on stoned fruit, I wish the result of the experiment might be made public, through the medium of your New England Farmer, for the benefit of at least one

LOVER OF GOOD FRUIT.

Lyme, Ct. Jan. 9, 1829.

From the Washington Telegraph.

Ma Editor-As this is a season when severe colds are very prevalent throughout the District, I have taken the liberty to send you for publication, the following recipe, which I found very effectual in my own case;

Cure for a Cold .- Take I teaspoonful of flax seed, with two penny worth of stick liquorice, and a quarter of a pound of sun raisins. Put them into two quarts of soft water; and let it simmer over a slow fire, till it is reduced to one; then add to it a quarter of a pound of brown sugar candy. pounded-a table spoonful of white wine vinegar or lemon juice.

Note-The vinegar is hest to be added only to that quantity you are going immediately to take : for if it be put into the whole, it is liable in a little time to grow flat.

Directions .- Drink half a pint at going to bed. and take a little when the cough is troublesome.

This recipe generally cures the worst of colds in two or three days, and if taken in time may be said to be almost an infallible remedy. It is a sovereign balsamic cordial for the lungs, without the opening qualities, which endanger fresh colds on going out. It has been known to cure colds, that have almost been settled into consumption, in less than three weeks.

The preparation is a tea spoonful of vinegar to

From the Richmond Enquirer.

ON GYPSUM-AND ITS USES IN AGRI-CULTURE.

Gypsum, or Plaster, as it is commonly called, is a kind of earthy salt, composed of lime, sulphuric acid and water. When pure, these ingredients enter into its composition in the following proportions, in each 100 parts, viz.

Lime,			32	to	34
Sulphuric acid,			46	to	48
Water,			22	to	18
		_			
			100		100

Besides the various uses to which it is applied in the arts, it is an article highly recommended in agriculture as a great fertilizer of the soil and promoter of vegetation.

It is in this latter view that the writer of the following remarks wishes it to be considered, being well satisfied that it deserves the particular attention of the citizens of Virginia, and more especially of those in the middle and lower sections of the state, where their lands have been cultivated generally with less care, in regard to their preservation, and are considerably more deteriorated and exhausted than those in the valley and moun-

It is employed by agriculturists in a variety of ways, and always with the happiest effects, when pure and properly applied. It is sometimes sown over cultivated grasses, grain and other vegetables, as a top dressing. Grain and seeds, after having been moistened, are often rolled in it, previous to their being sown or planted. And, occasionally, it is dropped in the hills with corn, &c.

In the application of it, as a top dressing, attention should be paid to the times, season of the year, and growth of the plant; choosing a close, still, damp day, or still foggy morning, as the wind blows it about too much, and in dry weather it is not apt to stick well to the plants. Some are of opinion that the best time to dress young clover, sown down on grain, with it, is when it gets three leaves; others advise to defer it till the grain is cut off. For old clover, the best time appears to be as soon as vegetation commences in the spring. Tobacco should be dressed with it when the plants begin to spread the hill, and corn, when about half a leg or knee high.

When it was first introduced among us as an article of agriculture, the very high encomiums bestowed upon it, and the almost incredible accounts related of its wonderful effects on vegetation, induced many of our farmers and planters to engage in the use of it, fondly hoping, no doubt, that with the aid of clover and plaster, they would be enabled, in a few years, to resuscitate their worn out and exhausted soils, and impart to them a degree of fertility equal, if not superior, to what they originally possessed. But the result of our experiments has not been such as to sustain the exalted character it had acquired. For, although in some instances its effects were truly astonishing, its operation in general appears to have been very uncertain. And we have often had the mortification to witness, after having encountered much trouble and expense in procuring and applying it to our crop, that it was productive of no perceivable benefit. A consequence so discouraging seems to have brought it somewhat into dis-

this time, as might have been expected, even those few who thought well of it at first, and were auxions to bring it into notice, have themselves bethere are even some grounds to apprehend, unless something shall be done to restore it to confidence, that it will ultimately be abandoned altogether. A misfortune the more to be deplored, because nothing is more certain than that, when pure and judiciously applied, there is not a greater fertilizer known. And, indeed, without the aid of some such powerful substance, it is believed to he utterly impracticable, after the lapse of a long series of years, so to improve our lands as to give to them that degree of fertility of which they are susceptible.

To trace this uncertainty in its operation to its source, and to point out the means by which in future it may be avoided, would be to re-establish it in the public confidence. As our planters and farmers would, undoubtedly, freely employ it, could they be well assured that, in laying out their money in the purchase of it, they would no longer be subjected to the hazard of a disappointment. This will now be attempted.

It has already been stated that gypsnm was composed of lime, sulphuric acid and water. And, by an attention to the relative proportions of each, it will be seen that, when pure, the sulphuric acid amounts to nearly half its weight.

The quantity usually sown on an acre, is a bushel, in which, as a bushel of ground plaster is said to weigh about eighty pounds, there would

Now, it must be obvious that 25.60 lbs. of lime, which would amount to little more than a peck. could not possibly produce any visible effect when spread over an acre of land. The quantity of water (17.60 lbs.) would be next to nothing; and that, therefore, all the operative virtue of the article must reside in the sulphuric acid.

Hence it may rationally be inferred that, generally speaking, whenever the plaster fails to act, it is in consequence of a deficiency in due proportion of this latter ingredient: an idea that will receive much countenance from an examination of its properties, some of which will be found peculiarly adapted to the promotion of vegetation .--Such as its capacity for attracting moisture from the atmosphere-and, when combined with it, of generating heat. Thus affording, in itself, two of the four great essentials. For, whatever may be the opinions of some philosophers respecting the gaseous and ethereal elements of vegetation, in practice it is found that nothing more seems to be necessary, in addition to soil of a proper texture plaster acts, it appears to be very generally imand judicious cultivation, than light, heat, air and moisture, distributed in due proportions.

It would certainly be highly proper that the legislature should extend the benefit of the inspection laws to the article of plaster, and establish inspections of it at suitable places, not only as affording relief and security to the purchaser, but as a measure of precaution, it being understood on good authority, that much of the refuse gyprepute. So that, far from being in general use at sum at the north, where they have inspections es-

tablished, is ground up and sent to the south, by fraudulent dealers in the article, for sale.

But, in the mean time, to enable those purchascome, in some measure, disgusted with it, and ers who are not conversant with it, to judge at once of its purity, without the possibility of being deceived, it is deemed proper to state that nitrous acid, commonly called aqua fortis, forms an unerring test. They have only to drop a small quantity of it on the plaster, (whether ground or in the rock, makes no difference,) and if it causes an effervescence-a foaming and frothing similar to what is observed when strong vinegar is ponred upon chalk, it is a proof of its impurity. And the degree of impurity may be pretty well ascertained by the mildness or vehemence of the efferves-

Lime has a great affinity for all, or most of the acids, whether mineral or vegetable, and will effervesce with any of them. But its attraction for the sulphuric acid is much more considerable than for the nitrous acid, and, therefore, when fully saturated with the former, the latter can exert no influence on it. For it is a law of chemical action, that two substances having an affinity for each other, being brought into contact, under suitable circumstances, they will unite and combine together in such a manner that they cannot be again separated, but by the presence and intervention of some third substance, having a greater affinity for one of the combined bodies than they have for each other.

When, then, the nitrous acid is perceived to act upon the gypsum, it is a proof that the sulphuric acid not having been in a quantity sufficient completely to saturate the lime, it has only been partially converted into gypsum, and that a portion still remains unchanged, which is the part acted upon by the nitrous acid.

In whatever way the plaster may be applied to crops, it must first undergo decomposition. For so long as it remains undecomposed, the sulphuric acid, the operative material, will be neutralized by the lime, and will not be in a condition to act on the atmosphere, and the plaster will have no more effect than so much sand, or a like quantity of any other pulverized rock.

By what the decomposition is caused, it is difficult to determine; but that it is something, probably carbonic acid, derived from the air, is rendered highly probable from the circumstance that it will remain inoperative if buried too deep under ground. That it is an acid, and acts altogether on the lime, is obvious, otherwise the sulphuric acid would not be set free in a perfectly disengaged state, but would only enter into a new combination, be neutralized as before, and remain perfectly inactive.

The best effect of plaster seems to be as a top dressing, used on dry land, and in cool dry weather; as in very wet seasons, and on low, flat, wet land, its influence is not very discoverable.

As to the modus operandi, or manner in which agined that it possesses the power of stimulating the earth into preternatural action, and that, however beneficial it may be at first, it will ultimately, by long continued use, produce exhaustion, and cause more injury than ever it did good. An opinion, probably growing out of the fact that a long and unremitted use of it brings about that condition of the soil denominated "plaster-sick."

The subscribers to this doctrine seem to consider the earth somewhat in the light of a lazy, sluggish beast, that may be forced into a motion greatly beyond its natural gait, but if continually put forward in this way for too long a period, its spirits become broken, its strength exhausted, and it finally tires and becomes incapable of further exertion, until, by rest, it has been enabled to recover its wonted vigor.

This opinion, taken up hastily, no doubt, and without much reflection, but bearing the authority of some great name, and wearing the air of plausibility, seems to have been as incautiously adopted, merely because men in general had rather subscribe to any opinion, on difficult subjects, that had the plea of plausibility and ingenuity on its side, and was ready made up to their hand, than be at the trouble and pains of reflecting and forming one for themselves. But as light, heat, air, and moisture are alone essential to vegetation, there was the less necessity for resorting to the stimulant properties of gypsum and the excitability of the earth: it being believed to be a well established fact that the only, or at least the chief office of the earth, is simply to serve as a matrix or bed for plants to grow in, and as a kind of laboratory in which the various processes of vegetation are elaborated.

Much, to be sure, depends on the nature, texture and preparation of the soil, which should be such, either naturally or artificially, as readily to imbibe moisture and to permit only of its gradual escape, that as much nourishment as possible may be retained to feed the roots of the young plants and to admit of an easy extension of them.

When, therefore, the soil is not naturally such as we would have it, it should be our business to make it so. Sand is open, warm, and generous : and moisture. Clay, on the contrary, is cold, difficultly penetrable, and very retentive. Thus, suitable quality, it is scarcely possible, by any pre- are clay-sick.* paration we can give it, to afford to mannre an cent salts, which readily attract moisture from the pounded bricks. atmosphere, and generate heat by thus hastening the decomposition of its putrescent particles; in this way producing effects similar to those of plas-

Lands rendered sterile by an excessive use of plaster, and which are then said to he "plastersick," are observed to be much in the condition of stiff clays that bave been run together by hasty, beating rains, and become baked as we call it; so that when an attempt is made to cultivate them, they break up in clods, and will not produce .--This arises, not, as has been imagined, from the strength of the earth having been exhausted by too great stimulation, but from the solvent property of the sulphuric acid contained in the plaster, (for, besides its two before mentioned properties, it is also known to possess that of a solvent,) which, by dissolving a portion of the ferruginous and other mineral matters contained in the earth, and converting them into clay, ultimately renders that soil stiff and obdurate which before was open and free. So that the texture of the land in this case, as in that of stiff clays, is no longer such as is proper for vegetation. Being too much compacted and its particles too closely wedged into

one another freely to receive, retain and gradually transmit heat, moisture, &c. But this is a discovery which leads at once to the remedy; for in both cases it becomes necessary that these lands should be dressed with sand, which should be ploughed and mixed with the earth so minutely as to divide and separate the particles of clay and keep it loose and open; when, no doubt, " plastersick" lands, as well as those that are sterile and unproductive, from being naturally too stiff and clayey, will be quickly restored and made to produce as well as ever.

The idea of dressing lands with sand or clay, according to circumstances, seems as yet to have been but little thought of in Virginia. Nothing, however, is mose certain than that, if judiciously applied, they will be found equally as valuable as any other dressing we could give them. These things are now as well understood in England as any other process in farming. There pits both of sand and clay are opened, and frequently they are carried the distance of many miles: it being a well known observation there, that the first step towards improving lands, if not naturally of a suit- in the usual way. able texture, is to make them so artificially; because they know that this is necessary to give to manure its full effect.

Formerly, before this was well understood and attended to, and previous to the introduction of gypsum, they attempted the improvement of their lands with marl. It succeeded very well at first, but by an incantions and excessive use of it, they finally rendered them barren and unproductive: and, in some instances, they are said not to have perfectly recovered in less than eighty years .--Marl is a fat, unctious kind of earth, and very tefreely receiving, and as freely parting with heat nacious; hence, when used in too great quantities, it has the effect of binding the soil, and causes it to become so close and cohesive as to renwhen our soil is too sandy, we should dress it der it unfit for useful production. Such lands with clay. When clay too much abounds, with might have been said to be marl-sick, and would two or three weeks, that a good deal of the corn sand. Attention to the texture of the soil is as have required the same remedy as those that are necessary as manuring: for, unless that is of a now said to be "plaster-sick," and I may add that

Burning stiff lands has nearly the same effect opportunity of exerting its full power; the chief as sanding of them, by indurating the particles been in his closet during the year past. This ear virtue of which, it is believed, resides in its liques and bringing them somewhat into the condition of

A FRIEND TO AGRICULTURE.

[Note by the Editor of the American Farmer.]-We have lately conversed with several farmers of experience, who have used plaster of Paris for many years. Their impressions appear to be, in brief: that laud which was rapidly brought some vears from a state of exhaustion to a state of fertility, by the use of plaster to promote the growth of clover, and to which land plaster had never hefore been applied, being since reduced by culture to its original degree of infertility, that land refuses to he acted upon again by plaster in any thing like the degree which it produced when formerly applied.]

A Farmer of German Flats .- Mr Chester Paine, of this town, raised this year, on less than I13 rods of ground, 52 bushels of Onions, Turnips, and Potatoes; being 7231 bushels per acre.-The circumference of one Turnip was nineteen From the American Farmer.

Important Observations on the Preservation of Indian Corn from the Fly or Wevil, in the Corn

DEAR SIR-For many years past, I had determined if ever I should build another corn house, it should be double the size necessary for housing my corn in the old way; intending to store it as pulled with the husks on. In the summer of 1827, I built such a house with a door at each end, and in the month of October from the 7th to the 27th, housed my corn therein from the carts as it was hanled in with the husks thereon. When the mornings were damp, the part then pulled was deposited in the barn for immediate use. Within two or three weeks, I have husked out by an invalid hand, all that remained of the crop so put away, and find that it has kept to admiration, it comes from the husk glossy and fresh like new corn, and not a layer more imperfect and unsound than would have been, had it been husked out at the time of pulling, and then separated

I send you three ears of my last year's crop, number 1, 2, 3. The two ears numbered 1, 2, were stored in the corn house as above, and lately husked. On examination you will find No. 1 perfectly free from fly holes, not a grain thereof injured; this ear was covered entirely with its husk. No. 2 has the most of its grains towards the small end only, fly eaten, as you will observe; this ear was not covered entirely with its husk out to the end thereof, and the part fly eaten exposed. No. 3 is an car that my manager, it being handsome and speckled, accidentally took from a heap as they were husking for immediate use in the fall of 1827, and carried into the house and put into his closet, where it remained until lately. As we both observe in husking out during the last was at the small end fly-eaten, and that it was never so in any of the ears except those not fully protected by the busk, it induced him to bring out and show me the ear No. 3, now sent, which had as you see is literally eaten to a honey comb, almost every grain thereof, by the fly.

From the above circumstances I draw the conclusion, that if I had husked out my crop last fall in the usual way, and so housed it, the whole thereof would have been totally ruined by the fly. Such an event did occur to my crop of corn made in the year of 1826 which was husked out and housed as is generally practised. What remained thereof in the fall of 1827, was scarcely fit to use, from the quantity of the fly therein. I am therefore satisfied that the plan of housing corn with its coat on, at any rate one half the crop made, is infinitely superior to the old method; moreover it is less likely to be pilfered.

The fall of 1827, winter and spring of 1827, 1828, were from the general quantity of rain that fell, peculiarly unpropitious to my experiment : on examination through the winter of 1827, 1828, the entire mass of husks and corn, for we dug into it, was often found in a giving state, and sometimes heated in a small degree, which alarmed me for its safety, but on the occurrence of a north wester, the busks almost immediately became cold, crisp, and dry, as when put into the

Some of the husks themselves were lost, per-

^{*} It is an old saying in England, that "He who marks sand buys land-He who marls clay throws all away."

summer time. However, the cows, even then, al- Its property of growing more densely than any though well pastured, seemed fond of and did eat them heartily, which I ascribed to the nubbins lasting and valuable timber it produces, when full and some ears not completely husked and left grown and at maturity, are distinguished qualities, than one to a barn, where divers sorts of cattle are amongst it.

I saved all the husks lately made, and put them in a shed convenient to the cow yard and shall shrub.

begin feeding with them.

With great respect, yours, JAMES CARROLL. Mount Clare, Oct. 2, 1828.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 16, 1829.

A NEW VARIETY OF POTATOES.

A paper entitled "Remarks on the cultivation of a new variety of Potatoes," read before the Farmer's Society, of the town of Florida, N. Y. by Dr S. REYNOLDS, and published in the New York Farmer, it will overspread a field, where large trees of this contains the following observations:

"For a long time past, we have had fine potatoes, for autumn, winter, and spring use: but it is only within a few years that I have had good ones resorted to, in order to preserve the old roots until the new ones were ripe, but all without success. By or before the middle of June, the old notatoes, however carefully laid up, became shrivelled and are yet small and tasteless, and so continue for several weeks. To supply this destitute period, I have found a kind of potato, which planted in a warm situation and on good soil, will contribute an abundant supply for the table before the old ones become useless. They were brought from a very northern latitude to this place, where they had climate, and will here ripen in forty or fifty days after they vegetate, and appear above ground.

These potatoes are white, smooth, with few eyes, and of a large shape, generally a little flattened; and as they came to me anonymous, I have given them the name of Florida whites.

"I have planted them for four years, and have always found them a great acquisition; nor do I row." think they deteriorate in any respect, but have every year improved in size. For the last two years I have planted them upon a good soil, highly manured, with coarse stable dung. By the first of August the tops turned yellow and died away. I then caused the roots to be dug and the land to be finely ploughed, and levelled with a harrow. Turnip seed was then sown, and covered with a light harrow, and the ground pressed with a heavy roller. At this late season I experienced no injury from the fly. The turnips were thinned out, kept abundant crop of solid fine turnips.

"The cultivation of the potato appeared to answer all the purposes of a summer fallow, so that I have reason to think my turnips were as good as if I had taken no previous crop."

LIVE FENCES.

other tree which attains an equal size, and the live fence, in my estimation, over any other tree or

" Some may object to the cedar, as growing too large, thereby producing a shade on the borders of the fields, much to the injury of the crops growing thereon. But the protection they would afford against the autumnal and wintry blasts, which frequently sweep over our fields, carrying with them the best particles of the soil, would amply compensate for the injury sustained from the shade; or by lopping and pruning they may be kept in such a state as to make but little shade as they produce no additional scions under this oneration. The cedar, unlike the hawthorn, must vegetate very quickly from the short time in which species are growing on its borders, the land having been previously cleared and afterwards suffered to lie dormant for a few years. I have frequently seen them bordering the highways on the north in the summer. Several experiments have been side of Long Island, spontaneously growing so closely together as to form almost an impervious hedge row and fine fence. The most easy and expeditious way of propagating cedar for fence, where the young trees may be had from the old watery, and almost or quite unfit for the table. At fields and woods free of expense is doubtless by this time the new ones are just beginning to form, and transplanting. But I had hitherto considered the cedar, like other evergreens, difficult to transplant with success; until sometime past, conversing with a friend on the subject, he informed me that he had been in the habit of transplanting them for the purpose of fence, for several successive seasons, and that he had experienced no difficulty with ordinary ones, in making them live and flourish well, become habituated to the short summers of that In cultivating the cedar from berries, having determined on the location, which, for 'convenience, should be by the side of an old fence-form a ridge by passing two or three times forth and back with the plough, and on this ridge plant the berries: and after being up, thin them out and prune them as their growth may require. By this means, in a few years, may be produced a beautiful hedge

FEEDING CATTLE.

An English writer observes, that two great points in feeding cattle are regularity and a particular care of the weaker individuals. On this last account there ought to be plenty of trough or rack room, that too many may not feed together; in which very common case the weaker are not only trampled down by the stronger, but they are worried, and become cowed and spiritless; than which there cannot be a more unfavorable state for thrift: free from weeds, and I have both years had an besides, these are ever compelled to shift with the worst of the fodder. This domineering spirit is so remarkably prevalent among horned cattle, that the writer has a hundred times observed the master beasts running from erib to crib, and absolutely neglecting their own provender for the sake of driving the inferior from theirs. This is, much oftener than suspected, the chief reason of that A writer for the New York Farmer recommends difference in a lot of beasts, after a winter's keep. "the juniper or red eedar," as well adapted for It is likewise, he says, a very common and very hedges, and says:-" The hardy nature of the shameful sight, in a dairy of cows, to see several plant—the ease with which it may be cultivated of them gored and wounded in a dozen places, in almost any soil or climate, is evinced from its mercly from the inattention of the owner, and the spontaneous growth in old neglected fields, from neglect of clipping the horns of those that butt.

haps one fourth part, being those got out in the the berries which it produces in great abundance. The weaker animals should be kept apart; and in crib feeding in the yard, it is a good method to tie up the master beasts at their meals.

Dr Deane says, "There should be more yards which go to give it a preference, for cultivation as kept. The sheep should have a yard by themselves at least; and the young stock another, that they may be wholly confined to such folder as the farmer can afford them."

SHEEP.

It is recommended to give ewes with lamb a somewhat more than ordinary quantity of food for a month or six weeks before they are expected to yean. Not enough, however, to make them fat, as dangerous consequences might attend their being in very high condition at that period. Turnips are said, by some writers, to be injurious to sheep with lamb, but may be given them after they have yeaned. If your sheep, whether store sheep or ewes with lamb, have good hay, about a quart of potatoes a day to each, will, it is said, be very beneficial, and an ample allowance.

"Care should be taken to place in the stable or yard, in which sheep are kept, small tubs or troughs of water for the sheep to drink in. They will do very well in summer without water, as they feed when the dew is on; but they need water in winter, especially if fed mostly on dry food. When sheep have colds, and discharge mucus from the nose, good feeding, together with pine boughs, given occasionally, will cure them; or tar spread over a board, over which a little fine salt is strewed. to induce sheep to lick up the tar, will cure a cold,"* Half a gill of Indian corn a day, given to each sheep, during winter, will, it is said, assist in keeping them in good heart, prevent the wool from falling off, and enable the ewes to rear their young better than they would if fed altogether on food of a less substantial nature.

"When several kinds of food can be procured, it is right to give them alternately to the sheep at different meals, in the course of the same day; the qualities of one kind aid or compensate those of another. At certain hours of the day any fodder should be given, and at others roots or grain. If there be any danger that the roots may decay, the winter should be begun with them, for alone they would not be sufficiently nutritious."

MASSACHUSETTS SOCIETY FOR PRO-MOTING AGRICULTURE.

The Committee on Agricultural Experiments, in addition to their Report made on the 15th day of October last, ask leave to submit the following :

That the Society's premium, of twenty dollars, be allowed and paid to Mr PAUL ADAMS, of Newbury, for the greatest quantity of winter rye raised on one acre, being thirtyeight bushels and five quarts. Mr Adams makes the following statement: "The soil on which the above crop grew, is a vellow loam upon a gravel bottom, in 1827 was planted with Indian corn, and manured with about 6 cords of compost manure, spread on and ploughed in. The said compost was made in the barnyard, from the droppings of the cattle, marsh sods, salt hay, &c. tredden and pulverized by the cattle. As I have been in the habit of growing rye, and manured with the like kind of dressings for a number of years, and have uniformly had good crops, some of them exceeding in quantity the last, it has suggested to me that the saline matter which was con-

^{*} Deane's New England Farmer. † Tessier's Treatise on Sheep.

tained in the manure did not help the same. The 300 tons of potatoes are consumed for that purpose seed was hood in the last hoeing of the corn, in August 1827-about five pecks to the acre-harvested in July 1828, and threshed two or three weeks after; and there were thirtyeight bushels and five quarts."

JOSIAH BASS, Esq. of Quincy, raised the past season, on one acre and fortytwo rods, thirtyfour bushels and three pecks of winter rye.

Two communications on the subject of destroying the bee moth were received by your committee: one of them from Mr D. CHANDLER, of South Hadley, in the county of Hampshire; and the other a long and learned dissertation from Doctor JAMES THATCHER, of Plymouth, author of the American Orchardist. Doctor THATCHER recommends several methods of destroying this insidious and powerful enemy, which has of late years infested the dwellings of one of the most useful and interesting animals with which bountiful Providence has supplied us. Your committee recommend that both these communications be inserted in the Massachusetts Agricultural Journal. They will afford valuable information to those farmers, and others, who usually keep bees; and may possibly elicit some further useful observations on this not unimportant subject. Mr Chandler does not hesitate to pronounce his method of preventing the ravages of the bee moth as a sovereign remedyone that may with full confidence be relied upon. Doctor Thatchea, it will be seen, expresses some doubts as to Mr Chandler's method, and closes his dissertation with recommending that the hives be deposited in a building to be provided for the express purpose of covering them, leaving openings to admit of the egress and ingress of the bees, whilst employed in collecting their winter stores; which apertures may be closed at night during the moth season. Your committee not being themselves fully satisfied that the very best method of destroying the bee moth has as yet been discovered, and therefore are not prepared to say that the communication of either gentleman conveys a new and decided preventative against the rayages of that insect, and such as creates a sufficient claim

JOHN C. GRAY, Boston, January 10, 1828.

ECONOMY IN FIREWOOD.

The size into which wood should be split, so as to be durable in burning, and yet give sufficient heat, is a matter worthy of some consideration. If split very small any given quantity will give more heat for a while, but will be quickly consumed; if large, it will consume slowly, but will burn less readily, and give much less heat. A fire composed of billets of wood not more than 14 inches long, will give more than two thirds as much heat as that made of wood double that length. Perhaps billets of from three to four inches diameter on a medium, will be found most economical.

GOOD BREAD.

An English publication asserts, that a mixture of two parts flour, and one of potato, makes an agreeable bread, which cannot be distinguished from wheaten bread. It is said that not less than

put, or stowed vertically, and the reaction power applied to both boars at the same time, horizontally; thus they expected to press two bales with one and the same power, in the same to press two bales with one and the same power, in the same time that it took to press one; but they failed in their purpose, both on account of reaction, and mode of stowing and pressing,

—for it was found impossible to confine fibrous materials with hands, that are stowed and pressed at right angles with the

stowing.
It is well known in Maine that Mr Moses B. Bliss, of Pittston Kennebec county, has recently made an important and useful improvement in the construction of a Press for Hay and other inprovement in the construction in a few prints and outset fifteen materials, and secured to himself the extensive property of said improvement, by taking out Letters Patent for the same under the Seal of the United States, which projects be claims, principally, first lawing made his box to revoke on trusions, which project from near the centre of its largest sides, so that it which project from near the centre of its largest sides, so that it may be turned to an prigit position for the convenience of filling and stowing, and then to a horizontal one for pressing.—
The other part of his specification has nothing very famicular in it, except in moving the machine by means of gear-work and a small cog-whole alliked to the aid of a large pair of locomotion wheels. This Press Mr Bliss has had in successful use for the part of the part tion wheets. I his Fress for Dilbs has had in successing using many months, and it has been fully tested by those well qualified to judge of its merits, and not their decided approbation.—
He has effected in this machine what has long been a desideratum, viz. to have a moveable press; and to have it moveable, it is necessary that it should be horizontal, and to have it horizontal, there must be a revolving box.

tal, there must be a revolving box. Why I would draw the attention of the public to the specifica-tion above, is, because the said persons have abandoned their press on the reaction plan, and initiated Mr Bliss in every particular except the revolving box, and are now attempting to palm off this imitation press under their credeatials for a reac-

MISCELLANIES.

We are glad that private balls for children are becoming more common. These meetings refine their thoughts and manners; exercise them most advantageously in a salutary accomplishment, and afford them the highest innocent delight. The consideration last mentioned ought ever to have weight ;-enjoyment should be studiously provided for the season of life in which it has its keenest zest. The true halcyon days are those of well treated children.

> "Gay hope is theirs by fancy fed, Less pleasing when possest; The tear forgot as soon as shed, The sunshine of the breast: Theirs buxom bealth of rosy hue, Wild wit, invention ever new, And lively cheer of vigor born; The thoughtless day, the easy night, The spirits pure, the slumbers light. 'That fly th' approach of morn."

Hints to the Ladies .- It has always been remarked, that the generality of females have many admirers, at the same time, few or no lovers; and they wonder at it-hut the reason is obvious-if they thought, but thinking has become quite unfashionable. "Ah!" said a venerable maiden, lamenting the degeneracy of the age, "courting is nothing to what it was when I was young. The flirts now a-days, make the fellows so saucy, that there is lardly to be found a respectable lover."
The observation was just. The ladies of the last age were more respected, because they were more reserved. For want of a proper reserve, they are treated with indifference, which is nearly allied to contempt. They make themselves too cheap to keep up their consequence, without which they can never be respectable. To speak philosophically, a lady must repel before she can attract .--All this advice may sound oddly to a female ear; but she who laughs at it, pays no great compliment to her understanding .- Ovid, who knew human nature tolerably well, discovered not a little penetration when he made Dapline fly so fast from her laurelled lover; for his passion was increased by the pursuit. Our Daphnes are quite another sort of people. Instead of flying from, they run into the arms of their Apollos, and are afterwards surprised that they grow cool to their charms:-Lovers are like sportsmen, to whom the possession of the game is nothing to the pleasure of the chase. If ladies would study less to please, they would give more pleasure. This is a paradox which those for whom I throw out these reflectious cannot comprehend, and until they can, they will never make their fortune by their faces .-The roses of youth arc not long in bloom, and when time has torn them away, there is an end to love at first sight; and on that they may seem by their manner of setting themselves off chiefly to depend. To be stared at a few seasons, and neglected, and in a few more, sink into oblivion, is the lot of a thousand showy girls, who have only external appearances to recommend them. . Without prudence and discretion, even the most substantial ornaments, though they excite admiration, will never procure esteem. Prudence is superior to pearls; and there is no kind of comparison between diamonds and discretion. Fools may be caught by the shell; but the man worth having will make the gem the object of deliberation .-Norfolk Herald.

Drunkenness and Education.-In the Noctes Amrosianæ of Blackwood for the present month, is the following dissertation on drunkenness:-North. Drunkenness is the cause of nine-tenths of the grief and guilt that aggravate the inevitable distress of the poor. Dry up that horrid thirst, and the hearts of the wretched would sing aloud for joy. In their sober sense, it seldom happens that men, in a Christian country, are such savages. But all cursed passions latent in the heart, and seemingly, at least, dead or nonexistent, while that heart beat heartily in sober industry, leap up fierce and full grown in the power of drunkenness, making the man at once a maniac, or rather at once converting him into a fiend.—Shepherd. There's nae cure for that but edication—edication o' the people—clear the Chemistry, and a short course upon the Anatomy and Diseases

hand, "My dear, do you think my bonnet is of more than a medium size?" "No indeed," re-

MR Jupp-I have noticed that the enterprising farmers in the north part of Hatfield, are about reclaiming a large swamp, of from 1000 to 2000 acres, and have actually succeeded in draining it by a canal from Connecticut river to the swamp. If they are not aware of the danger to themselves and the vicinity, from exposing such an extent of vegetable compound, it may be well to suggest to them, if they would escape the fatal diseases of malaria,* that the brushwood should be cut this winter while the frost is in the ground, and so arranged that it may be fired in the spring, and the entire surface burned J. H. F.

* See remarks on Malaria in our last paper .-Dr M'Culloch says the drainage of swamps and marshes is at first, and till they be put into cultivation, a source of disease undoubted. Such lands are productive of disease before they are drained, and they require drainage and cultivation as much for the purpose of preventing dis-case, as to increase the value of the produce.— Hamp. Gazette.

" Bliss in Action."-The all wise Disposer of all things has decreed that man shall find a positive pleasure in the due exercise of his powers and faculties corporeal and intellectual. But excessive exertions take away all wish for even salutary exercise, and he who carries labor to excess, will at length find moderate labor irksome, if not painful.

Exercise gives strength to every fibre, and energy to all the vital powers. But exercise, like most good practices and habits may be carried to excess. Extreme toil not only shortens life but brings less to pass than steady, but moderate: la bor. It is not, therefore, often advisable for farmers to undertake to perform what are called "great days' works;" for one day of over exertion may cause weeks of debility, if not months of subscribing, are entitled to a deduction of fifty cents. INTERNAL IMPROVEMENT.

RAILWAYS.

(By the Editor.) (Continued from page 202.)

In order to form a correct opinion of the practicability and expediency of making railways in the United States, it may be well to take a conplated improvements.

The Edinburgh Encyclopedia asserts that raileven to enumerate the various works of this desthe United Kingdom, as railways are universally employed at all the principal coal and iron works. in situations altogether inaccessible to a communication by water. In not a few instances they have been constructed by joint stock companies, and sometimes by individuals as public thoroughfares.

The only public railway of extent, in Scotland, is that between the manufacturing town of Kilmarnack and the harbor of Troon; which, agreeably to act of Parliament is open to all upon pay- in Surry, and other situations there are public ment of a certain toll. This extensive work, like those of the Duke of Bridgewater in English was executed at the sole expense of the Duke of according to the situation of the country. Portland, for the improvement of his Ayrshire estates. The Troon railway is about ten miles in length, and is laid down with two sets of cast iron tracks, of the description technically termed plate-rails. It crosses the river Irvine by a stone shut up, but for the introduction of the railway bridge of four arches, each of forty feet span, and the whole line forms an inclined plane falling towards the shipping port at the rate of about one sixteenth of an inch perpendicular in one yard horizontal. In its track it encounters a difficult pass through Shaulton moss; and towards the harbor the uniform line of draught is preserved by an embankment of about two miles in length .--This work with the great pier founded in about eighteen feet water in the lowest tides, together with the graving docks and whole establishment at Troon, were executed agreeably to a design of the late Mr Jessop's, and with the coal fittings, in the neighborhood, are understood to have cost about £150,000. The other railways in Scotland, which may be mentioned as of extent or interest are those of the Carron Company, the establishment of which is understood to have reduced the average monthly expenditure for carriage from £1200 to £300; the coal works of the Earls of Elgin and Mar, in Fife and Clackmannanshires; Sir John Hope, of Penkie; Mr Wauchope, of Edmonstone, and Mr Cadell, of Cockenzie, in Mid Lothian; Mr Dickson and others in Lanarkshire; and Mr Taylor and others in Ayrshire. These are edge-railways, and such of them as have lately been laid, are chiefly of malleable iron.

In England at all the coal and manufacturing districts, railways are employed for facilitating and economising the operations. In the counties

workings and railways require a separate map to the Neath canal there are several railways with show their position. Here the system of way- inclined planes of considerable magnitude, and at leave was first introduced, a source of revenue in Swansea, one is laid to the village of Oystermouth, the form of a tonnage, paid to landed proprietors, a distance of seven miles. On this line a stage for liberty to pass through their grounds with a coach plies daily with passengers, which indeed line of railway to the shipping port. In Cumber- appears to be its chief trade. In Caermarthenland, perhaps, the most interesting railways are shire there is a railway to the harbor of Lanelly. cise view of the subject as exemplified by the those of the under-ground works of Lord Lons- which extends about fifteen miles into the interior practice of Great Britain. Having ascertained dale, at Whitehaven. In the great manufactur- coal country. what has been done, and made a correct allow- ing and commercial county of Laucashire, railance for varying circumstances, we may be the ways are very numerous. A highly interesting nected with the shires of Caernarvon, Denbigh, better able to form an estimate of what may and work also occurs at the Duke of Bridgewater's and Merioneth there are several extensive railought to be accomplished with regard to contem- under-ground works at Worseley, about seven way works. That belonging to the slate quarries miles from Manchester. In Darby, Stafford, and at Pennrhyn is about six miles in extent, and is laid Warwickshires, railways are numerous, some of out in four successive horizontal tracks which ways are so numerous that it would be difficult which are connected with inclined planes, and are communicate with each other by means of three works of considerable extent, as those of little inclined planes, varying in length from 130 to 300 cription, which have been executed throughout Eaton and Butterly. At Mansfield in Notting- yards. On these the work is so arranged, that in ham there is a public railway nine miles in length, passing down the loaded wagons, the empty ones which was designed and executed by Mr Josias are taken up by a track rope, which winds round Jessop. In Shropshire, and indeed along the the axle of a brake wheel. On the more level parts whole course of the Severn, railways have been of the road the wagons are drawn by horses .introduced with the best effect. Those of Coalbrookdale, and its neighborhood, where Reynolds, the famous iron master first introduced the use of cast iron for railways and bridges, are highly interesting. At Chaltenham in Gloucestershire, enteen or eighteen years. Loughborough in Leicestershire, and Wandsworth railways varying in extent, from seven to twentyix miles, and differing in their line of draughts,

South Wales, perhaps, more than any other country of similar extent abounds with valuable minerals, which from the inaccessible nature of the country must have been in a great measure, system. Here a large uninhabited district of sterile mountains may be said all at once to have become the seat of populous towns and villages .-Such for example is Merthyr-tydvill, of which the Marquis of Bute is Lord of the Manor. When a distance of 125 miles, with a rise of 636 feet to the late Mr Crashey, the great Iron master of this the water-shade in the parish of Dolphingstown. district, established himself here about the year The survey from Berwick to Kelso, by the late 1765, the parish of Merthyr-tydvill contained a eminent Mr Rennic, has been farther continued very scanty population; but at the census of 1811, up Gala Water to Dalkeith, Ediuburgh, and Leith. that of 1821 it mounted up to 17,404. In the mineral districts of North Wales, con-The Pennthyn railway may now be considered as a pretty old establishment; and its good condition affords an example of the stability of the edge-railway, having been in (1824) use for sev-

In Ireland there are yet but few railways, excepting those of the Harbor-works of Dublin, and at quarries and other works of that description, which fre their temporary nature are not genart: but in the progress of improvement in that fine country we may look forward to the period when such works will be more generally estab-

In connexion with the railways mentioned above, we may mention several extensive surveys, which have been made for works of this description. One of these by Mr Telford, extends across the country from Glasgow to Berwick upon Tweed, it had increased to 11,104 inhabitants; and in by Mr Stevenson, who has also made a survey ways of this district are numerous, and many of uninterrupted level from the river Tay through them extensive, particularly in Glamorgan, Mon- the great valley of Strathmore to Aberdeen, with mouth, Caermarthen, and Brecknockshires .- branch lines to the ports of Stouchaven, Montrose, Among these may be mentioned the Sirhowy rail- Arbreath, Dundee, and Perth, comprising upwards way, which, with its branches and collateral of one hundred miles of level road. A collateral lines, extends upwards of thirty-five miles. It line has likewise been traced by the same engincrosses the Ebbwy by a bridge of 15 arches; forms | eer | from the confluence of the rivers Earn and a connexion with the Wye, and has had the cf. Tay, through the county of Fite to the westward fect of reducing the price of coals throughout the of Dunnerline, with various branch lines commuhigher parts of Radnor and Herefordshire. The nicating with the Frith of Forth. An extensive Cardiff and Merthyr-tydvill railway is about 27 road is now making of 36 miles in length, and 4 miles in length; and it is worthy of remark, that sets of tracks, connecting Liverpool with Manboth a common road and a navigable canal are chester by a railway, notwithstanding the water established between these places. At the great communications already established between these iron works of Merthyr-tydvill, Dowlais, Penydur- places by the river Mersey and the Irwell canal. It ran, and others in that neighborhood, much use is may further be mentioned, that after looking forminerals are transported upon an inclined plane, try between the Tyne and the Solway, (a track of railway is now contemplated, even by those who were most anxious that such improvement should back; that is, a weak one. be a navigable canal. These operations or certain compartments of them, may be expected ere long to be carried into effect, as the benefits of the railway system are every day more apparent. A public railway is now completed between the Forth and Clyde canal, and the extensive coal field in the vicinity of Monk-land canal, near Air-(To be continued.)

FOR THE NEW ENGLAND FARMER.

MR FESSENDEN-I take the liberty of transcribing the following, which I have not seen in the Farmer. The first is invaluable, and should be preserved or remembered by every farmer.

" Hoven in cattle .- As the distension is chiefly occasioned by carbonic acid gas, any substance which will combine with that gas will reduce it. Such a substance is readily found in ammonia (bartshorn) a spoonful of which, infused in water, and forced down the animal's throat, completely removes the distension." Annales de Chimie. Soda and Potash will combine as readily with carbonic acid gas as ammonia; and, therefore, if dissolved in water, may be efficaciously and safely administered.

Loudon's Magazine for August, mentions the establishment of two new agricultural schools on the Continent; one in France, by the Abbe du Pratt, the other in Bavaria, by Baron Von Closin. In the latter, to which is attached an experimental farm of 400 acres, youths from 10 to 15 years of age, are taken and maintained, clothed, and taught, for five years, for the value of their labor, and 50 florins (about \$22) entrance money. The example of Fellenburgh is effecting wonders in Europe. When shall we appreciate and profit by it?

Potato Mortar .- M. Cadet de-Vaux, found mortar of lime and sand, and also that made of clay, greatly improved in durability, by mixing boiled potatoes with it .- Bul. Un.

Plants raised from seeds which have been crossed, always bear the form of the mother, but that practitioners are wrong in their expectations take the colors of the male parent. Fewer seeds are produced by art than nature alone, and the impregnated flowers are less visited by bees than others .- Annales Hort. Soc. Paris.

The Monsieur Pear, a new variety, found in the woods, attracts much attention in France, on account of its large size, beauty of appearance, and excellent keeping qualities, remaining good till after Easter. Messrs Bose and Vilmorin consider this fruit to come very near, if not to he, the pear St Lezin .- Id.

Albany, Jan. 15, 1829.

HORSES.

The following remarks upon horses, are copied from the publication of an eminent farrier in Europe; and we think them worth the perusal of farmers generally.

The pulse of a horse in health, is from 36 to 40 beats in a minute, and may be easily felt by pressing the finger gently upon the temporal artery, which is situated about an inch and an half backwards from the corner of the eve.

Horses have not the faculty of puking, or even belching wind out of their stomachs, and therefore are peculiarly subject to wind cholic.

When a horse has been overridden, bloody spots may be seen in the whites of his eyes.

A horse that is hardy and good for business has a short back bone, which terminates forward of the hip bones.

A decoction of white oak bark will kill botts by tanning them, and they will become so shrivelled. as scarcely to be discernable when discharged.

The principal signs of a good horse are thesethe eyes set apart in the head, and large and bright; the quirl high in the forehead; one or two in the neck is a good sign; the neck well set on high; the shoulder blades pretty high, and converging to a point; the breast full and large, and so also behind; the body round, for flat bodied or slab sided horses are weak natured; the dock stiff, going wide behind, for if the gambols knock together, it shows that the horse is feeble: chewing the bit when provoked is a good sign .-It is a Spanish proverb, that the dapple grey will sooner die than tire .- N. Y. Gaz.

Considerations on the processes employed by Nurserymen for obtaining better sorts of Fruits, and on the means by which Nature appears to accomplish the same result. By M. POITEAU.

The author observes, it is but rarely that improved varieties of our cultivated fruits originate with nurserymen; they are generally the production of chance, found in the woods or hedges, or from distant corners of provinces, where the finer sorts are hardly known, and where the sorts they have are mismanaged or neglected. That "like begets or produces like," has long been considered a law of nature among animals and some vegetables; but this law is not always uniform, especially among domesticated animals or highly cultivated plants. Yet, on this principle, our nurservmen have acted in their endeavors to obtain better kinds of fruit, by sowing seeds of the best, in the hope that they would raise something still better. It is well known that in this process they have failed. The celebrated Duhamel and his contemporaries failed in the same way. From these and other instances, the author concludes of obtaining at once what can only be the result of time. He seems to infer that seedlings, apples or pears, for example, require some years and some cultivation, while they are passing from one stage of their infancy to another, before they can show their inherent qualities.

As proof of this conjecture, he instances the case of the fruit trees in the United States of America at this time. There, it appears, they have little trouble in procuring superior fruits from seed; and, that they have many excellent new kinds, their lists sufficiently testify. The cause of this he conceives to be, that the first imported fruits, which the colonists received from Europe 300 years ago, were, amidst the bustle of establishing and securing themselves in a new country, lost, from neglect or ignorance of the art of grafting; and that they only had recourse to seeds for perpetuating the kinds. These seedlings have passed through several generations, and are now arrived at that period of their existence in which their inherent qualities are fully developed.

The Americans, M. Poiteau adds, attribute this to another cause, namely, that in proportion as their newly broken up lands are ameliorated, by cultivation, &c. so, in like proportion, are the qualities of their fruit. It is a common saying in Virginia, that the fruits of such or such an or- Five gentlemen had gone with him to visit this

A limber dock is sure evidence of a limber chard "begin to change for the better." But this can hardly be admitted; for though such circumstance may improve the quality, it cannot change the physical characters of fruit.

After noticing the fact proved by Mr Knight, F. II. S. that a crab, fecundated by the pollen of a good fruit, produces better kinds from seed than can be had from seeds of improved fruit, be proceeds to describe the method used by the Flemish orchardists to obtain new sorts, and which is given on the authority of M. Van Mons. The Belgians, he says, do not prefer the seeds of ameliorated fruit. When the seedlings appear, they do not, as others do, choose such only as are free from spines, having large leaves, and remarkable for the thickness and beauty of their wood; but, on the contrary, such as are most spinous, provided the spines are long, and well furnished with buds or eyes placed near together. This last circumstance they consider as an indication that they will soon show fruit. Individuals having such properties are grafted, apples on paradise, and pears on quince stocks, to hasten fructification .-The first fruits of these grafts are generally bad; but whatever they are the seeds are carefully saved and sown. The second generation, treated in like manner, begins to show improvement. Through a third and fourth the process is continued, till they arrive at a point which gives fruit worthy of being preserved. Peaches and apricots, treated in the same way, yield excellent fruit the third generation; apples require four or five, and the pear about six, transitions. This process, concludes M. Poiteau, is only an imitation of that of nature, exemplified in America .- Annales Soc. de Hor. de Paris.

RAILWAYS.

By a gentleman just arrived in this city, we are told, that in an interview with Mr Black, a member of the legislature of South Carolina on his way to Charleston, the following information was communicated. A company had been incorporated for constructing three rail roads. One of these was to extend from Augusta to Charleston; a second from Columbia, and another from Orangeburg to the same place. In two or three hours after the books were opened, three hundred thousand dollars were subscribed. No doubt was entertained that the whole stock would be immediately made up with avidity, as it was considered the best in the state. The cost of construction was \$3000 per mile, and plenty of contractors were ready to engage for the performance of the work. The railways are to be of wood, and the iron on which the wheels are to run is already obtained from England at \$621 a ton. Live oak, cypress, and long leafed pine, are to furnish the sleepers. When these rot, they will take care to have provided stones from the upper country, brought down upon the rail road, to substitute in the place of the wood as it decays.

Mr B. said, that if the wood should last only ten, or even five years, they should consider it of little consequence, as they would thus have the means of giving it permanency afterwards. He was one of the stockholders, and had been to England to obtain information personally on the methods and advantages of internal improvement. A model of a rail road had been prepared in the neighborhood of Charleston, of about a mile perhaps in length, to put such a work to the test. The load for a horse was found to be ten tons.

model. On arriving at it, the six jumped into the car, and calling upon the boy to give them a ride, they had an opportunity of seeing how easily and smoothly the movement was effected. From Columbia to Charleston is 120 miles, and the toll for transportation is to be 25 cents on the bale of cotton from one place to the other. The present price of conveyance by a canal, through the same distance, is about a dollar and a half, so that the rail road, as soon as completed, will probably wholly supersede the canal, and make it of no use .- Penn. Gazette.

STATISTICS.

The Western Tiller contains a sensible and interesting paper on the population of the United States, in reference to the approaching census of 1830. The number of inhabitants in 1790, was 3,816,456, and calculated from the past ratio of increase, it will be at the next census, 12,520,500, giving an increase within these periods of 8,604,044. From this estimate the following important facts are deduced :-

The population of the United States has, in 40 years been trebled.

The states which in that time have received the greatest accession of numbers are New York, Ohio, and Pennsylvania.

That the middle and western non slave holding states, being New York, New Jersey, Pennsylvania, Ohio, Indiana, and Illinois, have, in the same space of time, multiplied their people more than five fold, and contain more than half the white inhabitants of the United States.

That the southern slave holding states, so called, Maryland, Virginia, North Carolina, South Carolina, Alabama, Mississippi, and Louisiana, have in that period, only doubled, and from nearly half, are reduced to less than one third of the whole popu-

That in reference to the most important points of national policy, to protection of American industry the centre of power has been entirely changed.

BOSTON MECHANICS.

An elegant Fire Engine, made by that excellent mechanic and engineer, Mr W. C. Hunneman of this city, was recently exhibited in State street. It appears to unite strength, power, and beauty, in a degree equal, at least to any of those recently imported into this city from the south-and is much cheaper. We understand that it was made for the King's Navy Yard, at the Havana, and that it cost but \$500-a sum not greater than that recently paid merely for repairs on one of our old Engines. The Engine made at Philadelphia, for preferences of location, difference in estimates of the city cost \$1200-and is put together with fifteen screws-the Cataract made in London with thirtysix-while this of Mr Hunneman's is secured with only nine screws - some evidence, we should think, of the superior simplicity of its construction. Boston Statesman.

Oil from Sunflowers .- A very delicate oil, much used in Russian cookery, is expressed from the seeds of the sunflower, and is prepared by enclosing them in bags, and steeping them in warm water, after which the oil is expressed; this is actually as sweet as butter .- Scotsman.

Pears.-Pears may be grafted on stocks of the Mountain Ash and the Service Tree; both of stocks would not. I have also seen apples graft- goods with the city of New York, from either of weighing three or four pounds.

that an apple could not live; but they are doing very well, and making exceedingly fine shoots .-Rusticus in Urbe. [Loudon's Magazine.]

makes the following very liberal offer:

subscriber to this paper, by the first day of May, cess of this, or of any other enterprise, that differ-(planting corn time) that shall, the approaching cut projects are to be undertaken. They all tend season, raise from one acre of land, the greatest to the improvement of the condition of the coun quantity of merchantable Indian corn, we will give try. Multiply them, and additional capacities are a Gold Medal valued at \$20, a Silver Tankard of afforded to employ and sustain an augmented the same value, or the like amount in cash, at the population. option of the person entitled to the premium."

We sincerely hope that the generous proposal of Mr Mendenhall, will be productive of good crops and Manufactures will expire, by their limitation, of corn to his subscribers-and of good crops of on the 20th February next. The question of subscribers to his paper .- U. S. Gazette.

Resolution.—For a soldier to meet the enemy in battle, where leaden deaths are whizzing on every side, must require no faint resolution; for a lover to pop the question of questions to his deary, when his heart goes pit-a-pat, and his tongue threatens to prove recreant to its office, requires no everyday effort of resolution; for a toper to quit the beloved bottle, and endeavor to stem the strong tide of his hankerings, requires a mighty resolutionand many a man, having proved victorious for a moment, goes back again to "treat resolution;" but of all the situatious in life requiring a determined, heroic and prodigious effort of resolution, that of getting out of a warm bed, in a keen cold morning, eaps the climax-we mean one of those mornings when your breath congeals on the sheets, when your fingers freeze fast to the door latch, and the very air itself seems stiffened with cold .- Berkshire American.

DEFERRED ARTICLES.

The following, intended for insertion last week were omitted by mistake.

Extracts from Governor Lincoln's Message. RAIL ROADS.

The examinations and surveys, which were assigned by the Legislature to the direction of the Commissioners of Internal Improvement, have been completed since the last session, and plans of proposed routes for Rail Roads from Boston to Providence, and from Boston to the Hudson River, with estimates of the cost of construction, in detailed Reports, will be submitted to your consideration. The reports will exhibit distances, expense, and comparative advantages from oceasions of husiness, upon every direction of way which of inquiry will remain, to occasion delay, in determining the manner and time of proceeding to the work. Every passing day bears witness, that for want of facilities to intercommunity between of the Commonwealth.

ed on quince stocks, and planted in a soil so wet which places, water conveyance, fifty miles inland into Massachusetts, is at half the cost of land carriage from Bo-ton to Worcester only. The occasion of business along this line of artificial communication has been estimated to require, for the The editor of the Wilmington (Del.) Advertiser, next year, the constant employment of at least twenty boats of a tonnage of from 20 to 30 tons "To any farmer who is now, or may become a each. It is not, however, to counteract the suc-

AGRICULTURAL SOCIETES.

The acts for the encouragement of Agriculture continuing the patronage of the government to those important interests, through the agency of the Agricultural Societies, will, therefore at this time, require decision. Before the next Legislature, the usual and convenient season for issuing proposals of premiums, for the current year, will have passed, and without the aid of Government, it may be feared that many of the Societies will be unable to hold their customary Exhibitions. To those who have had opportunities to witness the certain and beneficial influence of the bounty which has been distributed by these Institutions, it would be matter of regret that it should now cease. It has diffused a spirit of improvement from the Treasury Office to the remotest parts of the Commonwealth. No public bestowment was ever more faithfully applied, and none will be when the windows are erusted over with frost, found to have made richer returns to the source from which it was derived. As a measure of political economy, it has yielded, annually, an hundred fold its amount in the increase of taxable capital.

FROST WORK.

We have seen and heard of considerable damage accruing to fruit and forest trees by accumulations of ice on their slender branches. Peach trees in particular, have been pruned in a most unmerciful manner, by that mischievous personage, vulgarly called Jack Frost. The damage, however, from this cause, has not, we believe, been so great near the sea coast, as at some distance in the interior. The Lancaster Gazette, of the 13th inst. says, "vast numbers of trees, of all descriptions, have been broken, and in many instances ruined, by the weight of the ice collected on their branches. Peach trees have suffered particularly, and some of the beautiful elms which adorned our streets have fallen victims amidst the general havock. In the neighboring towns, we learn, the dantage to trees has been equally exhas justified examination, and no reasonable ground tensive. The injury done to young growths of wood is also very great. Some of the roads through the woods in the neighborhood are rendered impassable by the fallen trees. In Sterling and Princeton, we are informed the ice collected the interior and the capital of the State, the most on the trees much heavier than here. Mr Maserious diversions of trade are taking place, to nassah Willard brought to our office from Sterother markets. Aheady, hundreds of tons of ling a few very small branches of an apple tree, merchandize have been carried from the ware- on which the ice had collected to the thickness of houses of a neighboring government, through a two inches. He also showed us a specimen of new channel, into a central and populous district the general appearance of the fields in his neighbordood. On a few, say twenty or thirty speres By this channel, also, a direct trade in lumber of grass a solid mass of ice was formed, exhibithas commenced with the State of Maine, and in ing the appearance of a cluster of grapes, and FOR THE NEW ENGLAND FARMER.

ICE HOUSES AND REFRIGERATORS.

DEAR SIR-Col. PICKERING seat me the accompanying pamphlet on Ice Houses and Refrigerators, for examination, and if I concurred in opinion with him, desired that I would send it to you for republication. I think it might be very useful. Our butter is brought to market in a sad state in summer, and it makes me blush when I reflect, that for more than 30 years the Philadelphia market has been supplied with it packed in ice, and since Mr Moore's publication, in Refrigerators. I. P. DAVIS, Esq. imported one from Philadelphia, some years since, with the hope that it might be adopted here.

The republication of this tract, in the N. E. Farmer, would, I think, be the most effectual means of exciting our farmers to imitate those of Pennsylvania. I am, dear sir,

Boston, Jan. 20.

Respectfully yours. J. LOWELL.

An Essay on the most eligible construction of Ice Houses; also, a description of the newly invented Refrigerator, being a simple and cheap machine, by the use of which fresh provisions, butter, liquids, &c. may be cooled and preserved for family uses in the heat of summer, or taken to market in as good condition as in the winter season.

Agreeably to an intimation given the public some time since, I shall now endeavor to give some practical directions for the construction of Refrigerators, and (as being connected therewith) also attempt an investigation of the theory and practice of the art of preserving ice through the

I stated in a publication which circulated through several newspapers in the United States, that I had no pretensions to the discovery of new principles in the construction of the Refrigerator. The particular mode of applying some before known and understood, is all I claim as my invention; the utility of which has been fully proved during the last summer.

What I have to observe on the keeping of fee is merely an attempt to carry improvements already begun a step further than I have yet heard of. I have apprehended the reason why the art has not progressed faster, is because no one has yet fully investigated the principles upon which it depends; or, if this has been done by individuals, they have not favored the public with a knowledge thereof. This is my present object, and for reasons which will hereafter appear, I prefer going through it, before I enter on the subject of Refrigerators.

In treating this subject, it will be necessary to lay down certain positions relative to heat; some of which have not been well understood until very lately. All that I shall offer, have, however, been fully established by actual experiment. And in referring to the different writers who have published those valuable discoveries to the world .-Philosophical readers will know where to look for them, and those of a different class, it is presumed, will not wish to be troubled with such references or quotations.

Water is converted into ice at the temperature of 32° of Fahrenheit's Thermometer; and as long weight, and experience has proved, that the quanas any water remains in contact with the ice, the tity may be so great, as not to be all melted durtemperature of the ice will remain nearly station- ing a whole summer, in this situation. ary, but when the water is all frozen, the ice will gradually give out its heat to the incumbent atmosphere, until it acquires the same temperature.

and as I may probably have occasion to repeat of conducting power. this term, it will perhaps, be proper to give a definition of it. The capacity for heat which a body is said to possess, is, its propensity or power of imbibing and retaining a greater or lesser quantity of that fluid, and at the same time appear to be of the same temperature as a given standard, which may contain a much greater or smaller quantity. Thus in the subject under consideration, the capacity of water for heat, is greater than ice; it being found by experiment, that ice at the temperature of 32°, requires the addition of no less than 1460 of the same scale, or thereabouts, to reduce it to water. To elucidate the subject still further, let a pound of water at the freezing point (to wit) 320, and a pound of ice at the same temperature, be put in situations where they will both receive an equal quantity of heat; when the ice is all melted, it will be found that the water has acquired 1460 of heat, and of course will be at 1780. Or take a pound of water at 178°, and a pound of ice at 32°, put them together and cover them in a fit vessel, the ice will be melted and the mixture will be 320 or very nearly.

It appears then, that ice at 10°, deposited in a pit as before mentioned, and being in this solid state capable of conducting heat, must receive a sufficient quantity to raise the whole mass 220, hefore any will be melted; when the melting process commences, it will cease to be propagated to the internal parts, because all that is received at order to be as concise as possible, I shall avoid the surface, will go to supply the increased capacity of the water; and this will be produced in direct proportion to the heat received. The whole quantity requisite to melt all the ice, being just as much as would raise the temperature of the same weight of water 178°. The greater the quantity of ice, the longer it will be in melting, because, there will be less surface in proportion to its

> It seems then, our whole business is to guard against the introduction of heat; and in order to take effectual measures for this purpose, it is ne-

stance above that degree of temperature, will, in with more difficulty through some substances than either case be melted. The temperature of the others; that it passes through fluid mediums, by earth a few feet below the surface in this climate, transportation, or the interchange of particles; is generally found to be between 50 and 55°. If, and not from one particle to another, as in solid therefore, a pit be sunk in the earth and filled bodies. The capacity of air for retaining moistwith the coldest ice, (which may sometimes he ure is greatly increased by heat. The power of obtained as low as 10° by removing it from the air to conduct heat is increased more than four water and exposing it to a very cold atmosphere,) fold by moisture. An unequal distribution of heat the consequence will be, that the earth will give in fluids will always produce currents or interout heat to the ice, until the temperature of the change of particles; in general those of the highmass is raised to 32°; the process of melting will est temperature will rise to the surface; there is. then commence, and continue to go on, as long as however, an exception to this rule in water; beice remains. But this process will not be as rap- tween the temperatures of 40° and 32°, that fluid id as those who are unacquainted with the subject is more expanded than at temperatures a little might imagine: it would seem, that as melting higher, and consequently those particles which ice is always found to be at the temperature of receive a small additional heat, will descend. To 32°, that after the mass becomes raised to that this extraordinary property in water, is to be asdegree, the smallest addition of heat, would im- cribed some of the most wonderful phenomena in mediately convert the whole into water; but this nature; but does not affect the subject under conis not found to be the case; to prevent it, one of sideration. Substances which transmit heat freethe many wonderful properties of matter interpos- ly, such as 'the metals, are called conductors of es; and which only enables us to preserve ice at heat; and those through which it passes with difall. This is the difference between water and ficulty, such as wool, fur, &c. are called nonconice in their capacities for heat. As I would wish ductors; and they are called good or bad conducto be clearly understood by every class of readers, tors, or nonconductors, agreeably to their degree

(To be continued.)

From the Mass. Agric. Repository.

The Caledonian Horticultural Society in 1817, sent a deputation into the Low Countries and France to ascertain what improvements had been made in Horticulture or Gardening, during the twenty years in which intercourse had been cut off between Scotland and the Continent by that scourge and disgrace of human nature, war. It was a most praiseworthy example, and the reports of that committee have been published this year, 1823, in an octavo volume full of interesting matter in relation to Gardening, to fruits, and orchards. We shall only have time and room for the insertion of some short articles.

At Bruges in Flanders, proverbially the seat of the most improved agriculture, the committee on the 12th of August, make the following remarks: "In the course of our evening walk, we were attracted by a novel appearance in husbandry, the labors of the seed time and harvest seeming here to be united and contemporaneous. We entered a fine field of luxuriant rye, part of which remained uncut, but a large proportion had been cut down this morning (August 12th.) The crop had been carried aside; well rotted dung had been pretty liberally laid on the stubble; the Flemish plough was now at work: and to complete the picture of industry, and expedition, a man was actually engaged in sowing turnips on the same portions of the ploughed fields from which the rye crop had been reaped in the morning." This example ought not to be lost upon us. Our sun is much more powerful, and our vegetation more rapid than in Flanders. We know that some farmers do raise their second crops with us; but may we not carry this system much farther? We certainly can do it, by limiting the extent of our cultivated grounds, and bestowing greater labor on the quantity we do cultivate.

PROFESSOR VAN MONS OF BRUSSELS.

The Caledonian committee above mentioned, Ice exposed to an atmosphere at any temperature cessary to be acquainted with, and attend to, the horticulturist. He is Professor of Chemistry at above 32°, or, if placed in contact with any sub-following principles. That heat is transmitted Louvain, but has turned his attention very exten-

by himself, and Monsicur Duquesne, of Mons, he depth, and the inserted tree or scion, is pared away so considers that his collection contains about 800; of these as favorites from paternal regard, for we do not find that the London Horticultural Society to whom he has sent his best samples, have as yet admitted more than half a dozen into the catalogue of good fruits. Still his zeal is worthy of great praise. Our old fruits are running out, they are subject to constantly increasing diseases .-They must have been all first obtained by seedlings, and when a good variety was thus procured, it was propagated by grafts. Thus it has been with our Seckle pear, the only known excellent pear ever produced in the United States. It is now in every good garden. But the present age is not content with raising one good sort in a century: It is the fashion to try the powers of nature, and the next generation will see not only a greater variety, but probably enjoy much better kinds than any age which has gone before them.

SWEET POTATOES.

The sweet potato (Convolvulus Batatas) has been of late introduced into culture at Paris, and sent to that market for sale, and has been strongly recommended by Mons, Lelieur in a memoir on that subject. Neither the soil, nor climate of Paris is half as well calculated for this plant, as those of the vicinity of Boston. All the counties of the Old Colony, part of Middlesex, and some of the warm spots in Hampshire are excellently adapted to it. In Worcester and Berkshire it would probably not succeed, except in some favored spots; but if the horticulturists of Paris have waited 200 years since they were introduced into Spain, it is not surprising that we have so recently brought them into experiment.

A PHENOMENON IN GRAFTING.

At Brussels, the Committee of the Caledonian Horticultural Society witnessed one of the most extraordinary experiments in grafting; that of inserting an entire tree, on the stump of another. A farmers would only adopt that portion of the reneighbor, having in the spring season cut down ceipt, which requires a weekly attack on this enan apple tree, about fifteen feet high, which Professor Van Mons considered a desirable kind, and a good healthy tree, he immediately selected a by this course continually pursued, we have so stock of similar dimensions, and cutting it off near the ground, placed on it by the mode of peg graft- fourth part of the number we had three years ing, the foster tree; supported the tree by stakes; and excluded the air from the place of junction, by plastering it with clay, and afterwards heaping earth round it. The experiment succeeded perfectly; the tree becoming in the course of the second season nearly as vigorous as ever.

Now though we would not recommend this experiment, because it must be very precarious, and seldom useful, yet as being one of the highest triumphs of the horticultural art, we thought it worthy of a place in this Journal. The first thought of transferring from one tree to another a different species of fruit by a naked wooden stem, was undoubtedly bold and happy; but an attempt to transfer a whole tree in this manner, is certainly original.

By peg grafting it must be understood, that

the plan of Mr Knight, by raising new varieties. of which respectively will come into perfect contact. Of new varieties of seedling pears, raised chiefly A hole is made in the stock, of an inch or more in as to fit exactly the hole so made. The surfaces of being asked by the Committee, whether he meant the bark of each are then cut off smoothly, so as that they were all good, he replied, that there that the bark of the inserted tree will fit exactly were that number worthy of preservation. We all round with that of the stock. It is indispenmust, however, put down a considerable portion sable, that the liber and alburnum, that is the inner bark and the white wood of each tree, should exactly meet. The experiment was more curious than useful, but as a fact in natural history, it is descrying of notice. Few men would probably succeed in the attempt, but that it can be done in any case, almost staggers our faith; yet the authority is very respectable.- Ep.

> RECEIPT FOR DESTROYING CATERPILLARS, USED BY THE SOCIETY OF CHRISTIANS CALLED SHAK-ERS, AT CANTERBURY, N. II.

"Take equal parts of spirits of turpentine, and train oil; apply them by means of a swab fixed on a pole, commence the operation in the spring, (we suppose on the first appearance of nests) when these devouring insects begin to appear, and repeat the operation once a week, till the trees are in blow, and very few will escape with their Signed F. W. lives."

The head of the Family.

We must express our admiration of this receipt, not because of its novelty, for either of the ingredients would be quite sufficient to kill the insects, as will common soap suds from every Monday's wash, most thoroughly, without train oil or spirits of turpentine; but we admire it, as a specimen of the practice and industry of these citizens. If our farmers would only follow that part of the receipt, which requires a weekly attention, for three successive weeks, it is immaterial whether they use spirits of turpentine, or train oil, or soap suds, or the brush, proposed by Col. Pickering, the evil would be cured at any rate. The great difficulty is the neglect to do anything, till after the Caterpillars have covered the trees with nests. Then the labors of the sluggard commence, and one tree, (let his receipt be ever so perfect and powerful) will cost as much time and labor as ten trees would have required three weeks sooner. If our emy, the evil would soon cease, and in ten years we should scarce see a caterpillar in the country. much reduced the labor, that we have not one ago.-Ep.

BEAUTY OF TREES.

What can be more beautiful than trees? Their lofty trunks, august in their simplicity, asserting, to the most inexperienced eye, their infinite superiority over the imitative pillars of man's pride; their graceful play of wide spreading branches, and all the delicate and glorious machinery of jects of beauty and of interest before unnoticed. buds, leaves, flowers and fruit, that, with more than magical effect, burst from naked and rigid twigs, with all the rich, and heaven-breathing delectable odours, pure and fresh, and animating, pouring out spices and medicinale, brilliant and unimaginably varied colors, under essences; and making music, from the softest and most melancholy under-tones to the full organ peal of the mode of grafting which can only be practised on tempest. We wonder not that trees have been the the slightest knowledge of this science, never

sively to the emprovement of fruits, principally on trees of exactly the same circumference, the barks admiration of men in all periods and nations of the world. What is the richest country without trees? What barren and monotonous spot can they not convert into a paradise? Xerxes, in the midst of his most amhitious enterprise, stopped his vast army to contemplate the beauty of a tree. Cicero, from the throng, and exertion, and anxiety of the forum, was accustomed, Pliny tells us, to steal forth to a grove of plane trees to refresh and invigorate his spirit. In the Scapen groves the same author adds, Thucydides was supposed to have composed his noble histories. The Greek and Roman classics, indeed, abound with expressions of admiration of trees and woods, and with customs which have originated in that admiration: but above all, as the Bible surpasses, in the splendor and majesty of its poetry, all books in the world, so is its sylvan and arborescent imagery the most bold and beautiful. Beneath some spreading tree are the ancient patriarchs revealed to us, sitting in contemplation, or receiving the visits of angels; and what a calm and dignified picture of primeval life is presented to our imagination at the mention of Deborah, the wife of Dapidoth, judging the twelve tribes of Israel, between Ramalı and Bethel, in Mount Ephraim beneath the palm tree of Deborah. The oaks of Bashan, and the cedars of Lebanon, are but other and better names for glory and power. The vine, the olive, and the fig tree, are made imperishable emblems of peace, plenty, and festivity. David in his psalms, Solomon in his songs and proverbs, the Prophets in the sublime outpourings of the awful inspiration, and Christ in his parables, those most beautiful and perfect of all allegories, luxuriate in signs and similes drawn from the fair trees of the east.

SOURCES OF DISEASE.

The effluvia of rotten substances are often unsuspected causes of disease. The farmer, therefore, should be careful that he does not breathe in the steams of his old dunghills more than is necessary. And the greatest care should be taken to remove or cover with good loam all the filth of the house, hog pen, &c. Scattering quick lime over substances which emit unwholesome vapors will correct the evil. Spoiled meat, vegetables rotting in a cellar, &c. are often harbingers of disease. The compound of lime and chlorine, called bleaching powder, is still better than quick lime as a remedy against the evils arising from putrescence. See New England Farmer's Almanac, p. 32.

From the Christian Register.

GEOLOGY FOR SCHOOLS.

Numerous reasons urge the introduction of Geology as a branch of common education.

- 1. It is nearly allied to Geography, and like that, is calculated to enlarge the mind, and extend its views of the works of our Creator.
- 2. It is an interesting science. It opens to our view a new world, and presents to us many ob-
- 3. It is among the grandest of the sciences. It leads us to view with increased admiration, the towering mountain and awful precipice, and acquaints us with those features of the earth, which never fail to excite ideas of sublimity in the dullest mind.
- 4. It gives new interest and increased utility to our journeys and our walks. A person, with

out finding much to admire and to increase his store of knowledge.

amusement to the young. Wherever it has been cupies nearly three closely pointed columns of that introduced into schools, the pupils have devoted more or less of their pasume to examining and the closing remarks in the Report of the Directors, the more must you now prize him.—Broome Recollecting specimens from the minerals around which, together with the matter which precedes it, publican. them.

6. It teaches children to be observing. thousand objects before unnoticed press upon their view, and their imagination and taste are immediately put upon the alert and called to a useful exercise in discriminating between the beautiful and the deformed.

7. Wherever it has been introduced it has led to the discovery of deposits of useful minerals before unknown, and has already increased to a vast amount of individual and national wealth; and if generally understood could hardly fail of opening many more sources of industry and of wealth.

8. It would tend to forward scientific and accurate geological surveys as the foundation of Geological maps, and prepare the public to profit

by them.

9. No science is more practical. It acquaiuts farmers with the nature of their soils, and the methods of improving them; civil engineers with the materials for constructing roads, canals, railways, dams, wharves, &c. and the proper method of combining them; artists with the origin and nature of their paints, and the miner when and how to extend his researches, and points him to a reward for his labors, and cautions him against abortive attempts.

10. It is favorable to morals. The more innocent and useful amusements are scattered around the young, the less time and disposition they will have, to pursue those which are pernicious or useless. Besides, few subjects are better fitted to show the power and wisdom of Him who weighed the mountains in scales, and the hills in a balance.

11. It is easily acquired. The features of this science are not only striking and grand, but they are few and simple, and exactly fitted to the juvenile mind. And by the aid of specimens with bins, Jr. appropriate descriptions, its general principles are more easily and readily understood, than of any other science which is taught.

12. It is necessary. Without it gazeteers, and common journals of travels, cannot be understood; and a person is liable to find himself ignorant of the most common topics of conversation in the society he will frequently meet.

AGRICOLA.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 23, 1829.

RAIL ROAD REPORT.

The Report of the Board of Directors of Juternal Improvements on the practicability and expediency of a Rail Road from Boston to the Hudson River, and from Boston to Providence, was submitted to the Legislature on the 16th inst. together with the reports of the engineers, employed by the board, containing the results of their surveys, and estimates. These interesting and very important documents have been printed in a pamphlet of the tree. He was eight or ten miles from any more than 200 pages. It would not be possible house, and became much alarmed, as his strength only be deceived respecting the degree of barbato give sketches of the contents of this pamphlet was fast failing. At this critical moment, Natty rism."

passes from one country or place to another, with- sufficiently in detail to be intelligible and useful plunged into the creek on the opposite side of the without exceeding our limits. Besides, a summary tree, swam around it to where Joseph was, stopped view of the reports, &c, has been printed in the quietly until he mounted him, and then swam to 5. It furnishes a healthful and instructive Boston Daily Advertiser of the 17th inst. and ocpaper. We shall therefore, at present, merely copy be true. What a noble animal! and how much are as favorable to the great objects contemplated as could be hoped for, or even wished by the friends to internal improvement.

"The Directors therefore respectfully recommend to the Legislature to adopt measures for the construction of rail roads on the general routes to Albany and to Providence which have been pointed out, leaving the precise location to be selected by the persons who shall be entrusted with the execution of the work. As however the execution of the whole of these works would necessarily occupy a period of three or four years, and as a much safer judgment may be formed, of the cost and usefulness of the work, and of the comparative advantages of the mode of construction here recommended, after an experiment shall have been made on a part of one of the proposed routes, it is recommended that the operations of the first year shall be principally limited to the eastern section of the western route, and that such portion of the route only, beginning from Boston, shall be undertaken within the year, as it may be thought will be nearly completed. In pursuance of these views they recommend that a board of competent individuals be formed, with authority, subject at all times to the control of the Legislature, to employ the necessary engineers and agents, and take all necessary measures, for constructing the aforesaid rail roads to Albany and to Providence, and to raise the necessary sums of money from time to time, by loans in the name of the state, on stocks, bearing 41 per cent interest, payable quarterly, and reimbursed at any term from 15 to 20 years at their discretion." This able and elaborate report has the signatures of the following gentlemen, viz. Levi Lincoln, Nathan Hale, Stephen White, David Henshaw, Thomas W. Ward, Royal Makepeace, George Bond, William Foster, Edward H. Rob-

SAGACITY OF THE HORSE.

Having recently noticed in a foreign paper, that a man falling from his horse into the river, was seized by the animal and safely brought ashore, reminds us of a letter received from Steubenville, Ohio, in June last, addressed to a son of the editor, then in the village. "Joseph L. returned home last evening, and this morning related to me, with tears in his eyes, a most remarkable and almost incredible circumstance. Arriving at a creek, which the late heavy rains had rendered it hazardous to swim, he dismounted from his horse, and attempted to cross the creek on a tree that had fallen across it, holding the bridle in his hand, and compelling the horse to swim alongside. After he arrived about midway, the current became so rapid that Natty could not keep his course, but broke from him, and Joseph fell from the tree into the creek. He caught by a limb, and the horse swam to the shore, and then turned round to see what had become of his rider. His situation, consequently, was of great danger, as he found it impossible to regain

the shore with Joseph on his back! This story, as incredible as it may seem, you will believe to

HONEY.

Is there any man who has so little of a "sweet tooth in his head" that he will pass by a cup of honey, leaving it like an indifferent thing? It is not like one of the deleterious inventions of manit is not like molasses, that a yankee loves in hisyouth, but swallows in a more fiery shape as he grows old-but the taste for honcy is not to be lost, nor is there danger in its indulgence. Here is a field for taking advantage of the industry of bees, that we neglect in New England; and it is a neglect of self-interest-(of which our enemies would in other things be slow to accuse us.) The trouble of keeping ten swarms of bees is not equal to that of keeping one dog, be he

"Mongrel, puppy, whelp, or hound, Or cur of low degree."

and the profit from ten swarms would put in the farmer's pocket fifty dollars a year, - whereas Towser and Tyger, or Wolf or Lion, would cost twentyfive for food, and tricks and lawsuits for worrying sheep. The dog also, if he be quarrelsome, will make his master cultivate his angry passions-for who will not back his dog? or who will not fight for him?

But what different lessons would be set by the becs; industry, order, subordination, the mathematics-and defence, even to death, of their homes. We hope to see the bees in proportion to the flowers which are suffered to waste away like an unmarried beauty-raising admiration-but leaving no profitable legacy as a trace of brief existence .-Boston Evening Gazette.

ESKIMAUX DOGS.

It is stated in the Journal of Capt, Parry's expedition to discover a northwest passage, that "when the surface of the snow is good for travelling, six or seven dogs will draw from eight to ten hundred weight, at the rate of seven or eight miles an hour for several hours together, and will easily, under these circumstances, perform a journey of fifty or sixty miles a day."

ADVANTAGES OF GOOD ROADS.

Dr Anderson, in his Rural Recreations states, that "Around every market place you may suppose a number of concentric circles drawn, within each of which certain articles become marketable, which were not so before, and thus become the sources of wealth and prosperity to many individuals. Diminish the expense of carriage but one farthing. and you widen the circle; you form as it were a new creation, not only of stones and earth, and trees and plants, but men also; and what is more, of industry and happiness."

BAD ROADS AND BARBARISM.

The Abbe Raynal remarks, "Let us travel over all the countries of the earth, and wherever we shall find no facility of trading from a city to a town, and from a village to a hamlet, we may pronounce the people to be barbarons; and we shall

Fat Beef .- An ox seven years old, which weighed ket, a few days since. It is said this was the fattest beef ever raised in Rhode Island. The ox worked on a farm in Portsmouth, during the spring.

We can tell a bigger story about beef than this. Col. Asa Stebbins, of Deerfield, a few years since that American Independence be never celebrated fatted au ox which at seven years old, was killed, and sold at the Boston market, and weighed 2120 lbs.—Greenfield (Mass.) Gazette.

Chinese Flat Peach .- This most curious of fruits, introduced from China by the Horticultural Society of London, and figured and described in their Transactions, may be considered an anomaly of its species. The fruit is described as 21 inches wide, and only 11-16ths of an inch through from the stem to the outer side, and the existence of such a fruit has always been doubted, until actually received from China. Both the external appearance of the fruit and the pit, so singularly compressed in its form, would seem to be the result of art, rather than of nature. It is represented as being an early peach. About 20 trees are in possession of the author, which have been inoculated from the original, introduced by himself .- Prince's Treatise on Horticulture.

England .- The United Kingdom of G. Britain and Ireland contains 73 millions of acres, of which at least 54 millions of acres may be considered capable of cultivation. Half an acre with ordinary cultivation, is sufficient to supply an individual with corn, and one acre is sufficient to maintain a horse; consequently the United Kingdom contains enough land for the sustenance of 120 millions of people, and 4 millions of horses .- Edmunds on Political Economy.

From the Journal of the Times, an excellent pabefore us, "A Discourse delivered at Montpelier, Temperance Society. By Daniel O. Morton, Paster of the Congregational Church in Shoreham. From a hasty perusal, we cannot hesitate to rank it among the very best productions which the subject of intemperance has elicited, and we hope it will obtain a wide circulation. Our limits, this morning, afford us room but for a single quotation diseased; with useful Hints to the breders of Mules. From the latest London Edition.—Price 25 cts. Just received at the one containing a large amount of plain truth and good sense in a small compass. Hereafter, we shall be liberal in our extracts.

"Days of public convocation are an efficient cause of intemperance. Of this kind are military trainings and reviews, the raising and moving of buildings, and the celebration of American Independence. On all these occasions, liquors abound, and the temptations to intoxication are multiplied. The man of hoary locks, aheady bending over the grave, is heavy laden with ardent spirits; and the beardless boy, too, must drink, and perhaps take the name of God in vain, to convince us that he is a man. On days of military parade more proficiency is made in vice than in the science or art of war. Under the influence of a strange infatuation, some, who are generally sober men, consider it allowable, on these occasions, to drink deep and hard. Whether any become soldiers or not, many Jersey. are trained up to habits of intemperance. A short period of service, in time of war, under experienced officers, would better prepare men to fight their

"It is much to be regretted that the anniversary 2100 lbs. was offered for sale in the Newport mar- of our nation's birth should so often be made a day of rude mirth, of vain hilarity, and intemperate drinking. Do we thus thank the God of our fathers for his benign smiles and powerful aid, during the perilous struggle of the revolution? Better than that it should be trumpeted with puerile boastings and drunken joys!"

> Manufactories in Massachusetts,-There are 235 incorporated manufactories in this state. A large proportion of them manufacture cotton, wool, and iron: besides these there are incorporated companies for the manufacture of glass, hats, leather, wire, files, lead, duck, pins, soap-stone, cordage, salt, calico, brass, copper, lace, umbrellas, linen, hose, ale and beer, type, cotton gins, eards, glass bottles, paper, lead pipe, &c. The oldest incorporation is in 1794, of a woollen manufactory in Newburyport. There are large number of manufactories besides these, in Massachusetts, not incorporated .- Columbian Reporter.

MISCELLANIES.

We find the following lines in the Waldo (Mc) Democrat, but know nothing of their origin .- Bost. Adv.

THE TIMES.

The times-the times-I say the times, Are getting worse than ever; The good old ways our fathers trod Shall grace their children never; The homely hearth of honest mirth, The traces of their plough, The places of their worshiping, Are all forgotten now.

Farewell, the Farmer's honest looks, And independent mein, The tassel of his waving corn, The blossom of the bean, The turnip top and pumpkin vine, The produce of his toil, Have given place to flower pots And plants of foreign soil.

Farewell, the pleasant husking night, Its merry afterseenes, When Indian pudding smoked beside The giant pot of beans; When lasses joined the social band, Nor once affected fear, But gave a pretty cheek to kiss For every crimson car.*

Affected modesty was not The test of virtue then, And few took pains to swoon away At the sight of ugly mca; For well they knew the purity Which woman's life should own, Depends not on appearances, But on the heart alone.

Farewell to all the buoyancy The openness of youth, The confidence of kindly hearts, The consciousness of truth. The natural tone of sympathy, The language of the heart, Now curbed by fashion's tyranny, Or turned aside by art.

Farewell, the jovial quilting match, The song and merry play, The whirling of the pewter plate, The many pawas to pay, The mimic marriage brought about By leaping o'er the broom, The good old play of blind man's buff, The laugh that shook the room.

Farewell, the days of industry, The time has glided by, When pretty hands were prettiest At making pumpkin pie; When waiting maids were needed not, And morning brought along The music of the spinning wheel, And milkmaid's careless song.

Ah! artless days of innocence, Your dwellings are no more, And we are turning from the path Our fathers trod of yore-The homely hearth of honest mirth-The traces of the plough-The places of their worshiping, Are all forgotten now.

Time is so precious an article that Providence gives it to us in the smallest possible portions, never yielding us two moments at once, but always taking away one when the other is bestowed.

Lategrity.—Wit and understanding are trifles Harrowfal Peas Large Cabbage Lettuce Late Harrowfal Peas Large Cabbage Lettuce Late Harrowfal Peas Large Cabbage Lettuce Late Harrowfal Peas Large Cabbage Lettuce Late Harrowfal Peas Large Cabbage Lettuce Late Harrowfal Peas Large Cabbage Lettuce Large Cabbage Lettuce Large Whele Cabe Large Cabbage Lettuce Large Whele Cabe Large Cabbage Lettuce Large Cabbage Lettuce Large Cabbage Lettuce Large Whele Cabe Large Cabbage Lettuce Large Cabbage Large Large Large Cabbage Large L without integrity; it is that which gives value to China Dwarf string and shell every character. The ignorant peasant without faults, is greater than the philosopher with many: faults, is greater than the philosopher with many:
for what is genius, what is courage, without a
heart?

Large late Drumhead Cabbage
Large late Drumhead Cabbage
White Turnip Radish

Merit.—True merit is like a river, the deeper it Red Dutch Cabbage (for pickis the less noise it makes.

Value of hereditary property.- It should be considered with respect to wealth, that the value of it is never truly known, but by him who has acquired it; so that when a provident but unwise parent estate to his son, he only provides him something to waste and dissipate, but not to enjoy. The prodigal youth is even generally much less happy in specific to waste and dissipate, but not to enjoy. The prodigal youth is even generally much less happy in specifications for the management of the different sorts. Price \$3 per box. in spending the estate than the father in acquiring it : though the object of the father's toil has been to make the son happy in being exempted from toil. Besides, there are as great fortunes, and, perhaps, a greater number of moderate fortunes, in the hands of those who have acquired them as in those who have received them by inheritance; so that the chance of having a son die rich is perhaps as great when he has a good education, and has only been put in the way of providing for himself, as when he begins with that independence, which it should be the object of every one to possess.

Prosperity displays vice, and adversity is the touchstone of virtue.

Literature and Economy.—If a young man has a taste for literature, and virtuous and intelligent society, his economy will be a thing of course; because his pleasures will not be expensive, and under the Seal of the United States, which property he claims,

places, you will have a better chance of marrying. If a woman is ever so beautiful, being seen too often makes her cheap in the eyes of men. She who is but rarely seen, men covet most to see, and her chance of being happily married is much

A Wrestling Match .- A man lately undertook to wrestle with a half pint of Brandy. First, he took Brandy down, with great ease; but the day was won by Brandy, who took his antagonist down, and held him for the space of three hours! when ho suffered him to rise .- Berkshire American.

A gentleman from Boston, on a visit to his friend in the country, speaking of the times, observed that his wife had lately expended \$50 for a habit. His friend replied, "here in the country, we don't allow our wives to get into such habits.

A man with his wife and child, says the Newburyport Herald, in Newbury, Mass. on Saturday last, came very near suffocation, from a pan of burning coals, in their sleeping room. A peculiar noise brought some one to their room, where they were found in an insensible state-but resuscitated by exposure to the fresh atmosphere.

To the Public.

The subscriber would inform the public, that certain persons. did, some time since, obtain a certain Patent Right, claiming Only some times meet, outsing a treatment atom a tagent, comming for their improvement, a stearction principle, or action two ways, vainly supposing they were about to alter one of the fundamental laws of mechanism, by gaining in time without a loss of power, or goining in power without a loss of time. This fooling the tage statempted to demonstrate by constructing a Press for Hay, &c. with two fixed horizontal boxes, one on each end of a horizontal frame. In these boxes the hay or cotton was to be notrzonia if aine. In these coxis to en aly or conton was to the put, or stowed vertically, and the reaction power applied to both boxes at the same time, horizontally; thus they expected opress two bales with one aid the same power, in the same time that it took to press one; but they failed in their purpose both on account of reaction, and mode of stowing and pressing, -for it was found impossible to confine fibrous loaterials with hands, that are stowed and pressed at right angles with the

stowing.
It is well known in Maine that Mr Moscs B. Bliss, of Pittston,
Kennebec county, has recently made an important and useful
improvement in the construction of a Press for Illay and other fibrous materials, and secured to himself the extensive property because his pleasures will not be expensive, and under the Seal of the United States, which property he claims, mot dependent on the caprice of fashionable and extravagant associates.

A woman never appears so truly amiable as in retirement; her virtues shine with double lustre.

Do not idly imagine that, by running to public laces you will have a butter of the property her claims, which project from near the centre of its largest sides, so that it may be turned to an unright position for the convenience of filling and stowing, and then to also it in the content of this specification has nothing very particular in it, except in moving the machine by means of gen-work and a small cog-whocle affect of a large pair of locomotion which is pressured and the convenience of filling and stowing and their observations for the control of the United States, which property he claims, and the state of its largest sides, so that it may be turned to an unright position for the convenience of filling and stowing, and then to a horizontal one for pressing.—

To state the variety of the United States, which property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the categories of the United States, which property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, which property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property he claims, and the property her claims, and the property her claims, and the property her claims, and the property her claims, and the property her claims, and the property her claims, and the tion wices. This Fress Bit Bits Bas Bad in successfol use for many months, and it has been fully tested by those well qualified to judge of its merits, and met their decided approbation.—
He has effected in this machine what has long been a desideration, viz. to have a moveable press; and to have it moveable, it is necessary that it should be horizontal, and to have it more than 11 those must be a revolving hox. tal, there must be a revolving box.

tal, there must be a revolving box.

Why I would draw the attention of the public to the specification above, is, because the said persons have abandoned their
press on the reaction plan, and imitated Mr Bliss in every particular except the revolving box, and are now attempting to palm off this imitation press under their credentials for a reac-

The public are advised to compare the specifications with the model now exhibiting.

AGRICULTURE.

We give the following papers with much satisfaction, because we are persuaded they will prove profitable to many of our readers. The answer 'o the inquiries was dictated by the experience of a sagacious and successful cultivator, whose directions being founded on practice are much more valuable than the most probable and plausible theories, which have not been tested by experiment.

CULTIVATION OF INDIAN CORN, TUR-NIPS, PUMPKINS, AND SQUASHES. Princeton, (N. J.) Nov. 18, 1828.

J. L. BOYLSTON, Esq.

riculture sympathize with each other, I make no asily as upon a common turnpike road. apology for the intrusion of this address.

(seen in several of the newspapers) of the product cient for the most frequented traffic or interof a field of yours, in the articles of Corn, Pump- purse, for which, in the common way, five or six sa kins, and Turnips. As to the quantity of corn per acre, it did not surprise me; as I have known and about ten years. I first harrowed the piece while of sheep, and a small farm, I am desirous to profit stances fully equal, and some superior, where at the ground was wet, and when the ground was traordinary pains were taken, and great richness sufficiently dry I ploughed the same both ways, of soil attained. But the amount of the other are and afterwards harrowed the same twice. I used the liberty of requesting you to insert the subjointicles, especially of the pumpkins, cultivated in on the piece about ninety loads of green dung, and with the corn, has forcibly arrested my atten- which was ploughed in; the piece containing 31 tion. I have never been able, with all my z al acres and 28 rods. The corn I allowed five stalks your correspondents in the wool growing States. and exertion, to do anything, even decent, in this way. I consider pumpkins as an extremely value because it was not planted in rows. The stalks nable and desirable crop; but have always misera- were five inches apart. The pumpkin seeds were bly failed, whenever I attempted to raise them planted at the same time with the corn; and among corn. Whether the failure in my har's placed between the kernels of corn; and planted has arisen, from planting at a wrong time, or fine between the Alst of Mar and the 1st of June .the character of our soil, or from the corn being The turnips are what we call the flat English turso thick as to overshadow and destroy the pump- nips. The latter were sown after the corn was kins, I know not: but the fact is, I have never ploughed, between the 25th of June and first of been able to succeed in raising even a single wagon July. The soil is a black mould. I used about a load from a field of nearly two acres.

requesting, that you will do me the favor, at your our farmers generally is not a correct one,-that is convenience, to inform me, by mail, the manner carting their manure out in a field that they intend in which your culture of the articles referred to to plant with corn the next season; thereby exthe corn ;-and whether you used any separate tivity. and additional manure for the pumpkins, &c.

the Theological Seminary in this place, I amuse the country. The squash is accounted a valuable myself with a garden, and a little farm, consisting vegetable for the table, and is also used for pies .of 14 acres. I have but little time to attend to I consider that they can be raised in the room of these things; but yet am fond of setting my neighalso on my friends around me.

I am, sir, most respectfully,

Your obedient servant, SAM'L MILLER.

J. L. BOYLSTON, Esq.

P. S. I have heard much of the value of what pumpkins. What is your opinion of that article? purchased of him, for several years, and must beg section, and at this particular time. The people

If you think well of it, and should have it in your any time call you to Massachusetts, it would give power to send me a few dozen seeds, directed to me the highest gratification to see you at my me, and transmitted by some convenient private Mansion. conveyance, to Messrs. Thorburn & Son, New York, I should consider it a great favor, and the little packet would soon reach me.

SELECTING FRUIT TREES.

MR FESSENDEN-Observing the exertions, which are made at this time to introduce good fruits into this part of the country, particularly apples and pears, I have long waited, hoping a suitable person would suggest some necessary hints to nurserymen and inexperienced purchasers of trees. I allude particularly to the quality of the trees, as well as the fruit, and no trees should be selected which want either of the following qualities-suitseeds I have on hand, I have applied to Mr Rus. ableness to the climate-thriftiness-good bear-

This is a subject of peculiar importance in this

been made to believe that fruit trees may be cultivated to advantage. Indeed it may be doubted if their prejudices would have yielded to anything but the evidence of their senses. * The entire success of one individual* has happily furnished this ly by all our towns. evidence.

These circumstances, sir, must make it obvious to you, that it is for the interest of this region that the excited hopes of our farmers be not blighted; and their laudable endeavors frustrated by the injudicious selection of trees not suited to the climate, or requiring more skill in the management than is possessed by our common cultivators. I hope the nurserymen will take these hints. It appears to me their interest is concerned, and that good caution to buyers, and a selection of trees of vithout integrity; it is that which gives value to varieties suited to domestic uses al all seasons, not very character. The ignorant peasant without wanting either of the four qualities above men-aults, is greater than the philosopher with many: tioned, would create a confidence in them, which or what is genius, what is courage, without a would result to their advantage. I have some leart? fault to find with our books on the subject of orchards and fruit trees. In some instances they neglect to inform us among other points whether s the less noise it makes. certain trees are good bearers-when the fruit ripens-how it keeps, and other properties important to be known. I hope this may be remedied in future editions.

Allow me, sir, to repeat my strong conviction that all trees, which are not suited to this climate, are not healthy, and vigorous, and good bearers of good fruit, would be a nuisance in this country, and such trees are to be rejected absolutely, to give place to those of better properties.

Respectfully your obed't serv't,

SAMUEL LITTLE. Bucksport, Me. Jan. 24, 1829.

TOWN MAPS.

MR FESSENDEN-I have just turned my eve from a short article in the American Traveller, upon the subject of town maps. I was surprised at the very trifling sum, at which they may be procured. It is stated that Mr Pendleton of this city, well known as a lithographic drawer and printer, the subject demands. gives information that from 2 to 500 copies can be furnished, after a manuscript draft is prepared at from $12\frac{1}{2}$ to 25 cts each. It seems to me that in any town, almost every family would gladly pay twice that sum, for a correct map of their place of principal buildings, &c. In such maps it would benefits. not be difficult to present a geological view of a town, by some signs or marks to designate the different kinds of rocks or other minerals, soil, deposits of clay, sand, peat, &c.

Such maps would be of particular benefit to those who have invested, or wish to invest property in manufactories, to farmers, and even to almost every class of the community. All our public schools might to great advantage introduce maps of the towns where they are placed. And if well formed they could hardly fail of becoming important instruments for the general diffusion of useful and practical information.

In most towns surveys and manuscript drafts might be made, with little or no expense. If a number of young men who wish for general improvement, should procure the aid of some ex-

Twothirds of our usual high-way tax would keep our roads in good repair were broad rimmed wheels AGRICOLA. in use.

IMPROVEMENT IN RAIL-WAYS, &c.

DR MEASE, of Philadelphia, whose science, activity, and public spirit, have ever led him to take a prominent and useful part, whenever improvement was the object, has obliged us with the following article. It will be perceived that it states what has been and may be done, but gives no details of the manner in which the great objects adverted to are effected. But it will, we hope, lead to such further investigations as the importance of riages passing on them.

FOR THE NEW ENGLAND FARMER.

Philadelphia, Jan. 28, 1829.

Sir,-I have the pleasure to send you the residence, pointing out all the water courses, sketch of a new and improved plan for constructponds, mill privileges or establishments, roads, ing iron rail-ways, which appears to promise great line, and the least deviation from that line occa-JAMES MEASE.

SKETCH

Of a new and improved plan of constructing iron rail-ways and carriages, by which all sorts of goods, merchandize, and other articles whatever, as likewise passengers, will be conveyed with much greater ease, convenience and speed, and with less expense than could till now be effected, by employing either the power of steam, or that of horses.

It is generally acknowledged by the most eminent engineers, and by the most impartial writers on mechanical subjects, that the present construction of rail-ways and of the carriages or wagons conveyed upon them is still very far from being arrived at that degree of perfection, of which, by their principle, they appear to be susceptible, and it cannot be denied that, upon the whole, this most valuable invention is yet in a state of infancy. cannot, like common carriages upon a turnpike

To this imperfect state it is undoubtedly owing, that those artificial roads, though known and parwhole countries and for all sorts of conveyance; that the greatest part of those companies which a few years ago had associated themselves for the establishment of rail-ways in different directions all over England, have been dissolved, and that almost none of those numerous and magnificent projects which were announced in the English papers has been carried into execution.

It is, therefore, my opinion, that before any impertant and extensive plan of that kind can be adopted with a certain prospect of success, it will he necessary to bring those roads with their vehicles and all their other mechanical contrivances to a higher degree of perfection, by removing all the difficulties and inconveniences to which in their

present state they are subject.

In the first place, on the flat rails or tram-ways as well as on the edge rails, the continual rubbing I of the wheels against the upstanding rims of the Elates, or of the projecting flanges of the wheels against the sides of the rails, causes a considerable idered with respect to wealth, that the value of it resistance, by which not only a great part of the moving power is wasted in a useless manner, but which also tends to loosen the rails and disturb their foundation. This is particularly visible on all sorts of rail-ways where the carriages are drawn by horses, who by their trampling shake the sleepers and the whole foundation in such a manner that the rails become in a short time loose, with their joints displaced, their ends standing up and their parallelism destroyed, the immediate consequences of which are: an increased resistance, violent jolts, frequent breaking of wheels and rails, continual repairs and delays, and the speedy destruction of the whole work.

2dly. Where horses are employed, the flat as well as the edge rails, but particularly the first, are continually filled and covered with sand, gravel or mud, thrown up by the feet of those animals, so that the rails often become so obstructed as to occasion a considerable resistance to the car-

3dly. With regard to the wagons or carriages used upon either of these rail-ways, their present construction is so clumsy and defective in every respect, that they hardly deserve the name of machines. As both axle-trees are immoveably fixed on the body of the wagon or tram, these vehicles can only go forward and backward in a straight sions a very considerable rubbing and fretting of the wheels on the bottom and against the sides or rims of the rails, and of course a great additional resistance with a most destructive wear and tear of the rails and wheels.

4thly. On such places where a rail-way ceases or where it must be interrupted, which is unavoidable upon long lines passing through towns, over long and narrow bridges, etc., these wagons are incapable to leave the rails and to be brought over any common road, paved street or other ground. They must, therefore, be unloaded, and their contents carried on upon common carriages-a very troublesome operation, which is always attended with expense and great loss of time.

5thly. One of the greatest objections to the present system of rail-ways is, that the carriages are so confined to the track of the rails, that they

tion the same line, or where a slower moving which of course will never be obstructed. train is overtaken by a quicker one. The siding contrivance. They can only be placed at certain rail-way of the shortest radius, (f. i. of 20 feet,) distances and are of no use to the carriages meet-but also to leave the rails and to be conveyed over ing between those places; their management is common roads like any ordinary wagon. These extremely tedious and troublesome, and though, carriages, therefore, can go on without interruption for want of a better and more convenient method, through towns and villages, and over bridges, they may answer in some degree for the slowest where the rails cannot be continued, remaining transports, they will be of no service at all for loaded till they arrive at their final destination. quick conveyances, on account of the great loss cannot be stopped so quickly and easily upon a rail-way as upon a common turnpike road.

6thly. As the principal advantage of rail-ways and their great superiority over canals consists in the quickness of conveyance and in the possibility of employing mechanical power instead of horses, the application of locomotive and stationary steam engines has been proposed and partly introduced in England for the propelling of all sorts of vehicles upon iron rail-ways. But of all the trials which till now have been made, not one has vet succeeded to such a degree as to answer fully the sanguine expectations of their projectors. The greatest speed which with either of these engines can be given to a chain of heavy loaded carriages without the most imminent danger of dashing both rails and wagons to pieces, does hardly exceed six miles an hour; and as the greatest part of the power of the locomotive engines is absorbed by their own weight, and of the stationary engines by the weight and friction of the long ropes or chains, the expense of fuel is very considerable, and surpasses the expense of horses, wherever a ton of coals costs more than eight shillings.

Being perfectly acquainted with all the newest mechanical inventions, by a residence of nine paratus, and with any (reasonable) velocity. years in England, and strongly impressed with the high importance of this particular subject, I have for these twenty years past, applied myself with the greatest assiduity, to the improvement of railways, and by constant study and after many expensive experiments, I have at last succeeded in ted are completely removed, and the conveyance upon rail-ways is brought to a degree of perfection, which, till now, was scarcely thought pos-

The principal advantages of this new plan, are as follows:

The raids are constructed in such a manner, that the carriages move along them with the greatest facility, and without any sensible lateral friction, though the wheels are regularly kept upon their track. By this means, and by a more advantageous, yet simple, construction of the wagons, the resistance is so much reduced, that upon a dead level the power of one herse is sufficient to draw with ease and in a good pace, a load of twelve to fourteen tons upon several carriages linked toge-

more solid manner, and, as the horses do not walk between the rails, but on the outside of them, and upon a separate path which is somewhat lower,

road, turn out to pass each other when meeting can they throw any sand or mire upon the rails,

The peculiar construction of the carriages alplaces, or turnouts complayed for that purpose in lows them not only to turn without the least diffi-England, are but a very imperfect and bungling culty in any deviating direction and upon a curved

By a very simple and easy contrivance my carof time attending every such operation, and of the plages can also be turned off the rails at any point danger of the carriages running foul of each oth- where it will be found necessary, either to avoid er, because the momentum inertia of such masses other wagons meeting on the same track, or to pass by those which they have overtaken, and return again into their first line, so that no siding places, turning plates, nor any other apparatus of that kind are necessary for such an operation, which can be performed almost as quickly and easily as upon a common turnpike road.

This very important improvement affords the advantage, that a double track of rails will be sufficient for the most frequented traffic or intercourse, for which, in the common way, five or six parallel tracks would be required, and that any number of slow and heavy wagons can pass on the same line, and at the same time, with as many light and quick carriages, in the same, or in an opposite direction.

To employ the power of steam with the greatest advantage, and with the least possible expense, for the propelling of all sorts of carriages upon rail-ways, I have discovered a new principle by which the power and motion of the stationary engines, established at considerable distances or intervals and working without interruption, can be imparted to any number of loaded carriages passing upon a rail-way from one engine to the other without ropes or chains or any other intermediate ap-

A rail-road constructed anywhere upon this new plan, and with all these improvements, and new inventions, (the reality of which is partly proved by experiments made upon a pretty large scale, partly founded on the most infallible principles, and for the success of which I will make myself hitting upon an entirely new plan, by which all responsible) cannot fail to have a decided superithe difficulties and inconveniences here enumera- ority over canals, as well as over common railways of the present construction used in Great recommend the construction of a rail-road for the Britain.

This superiority has already been acknowledged by a committee of the Royal Academy of Sciences, and by one of the Agricultural and Polytechnical Societies at Munich, who, after having examined my plan and assisted at the experiments, ient, and the annual income to the proprietors and have made and published very favorable reports. And though there is in this country a strong interested party for canals, yet all cur proprietors and capitalists, and also the majority of both houses of our representative assembly, are so well instructed and disposed that my plan for uniting the two greatest navigable rivers in Germany, the Danube and the Rhine (through the Main) by means of an iron rail-way of my invention, is about to be adopted.

But I am convinced that nowhere in the world, The foundation of the rails is fixed in a much the introduction of this new plan of rail-ways could afford such immense advantages as in the United States, where the most rapid and prodigious progress in every branch of internal imtheir trampling cannot injure the foundation, nor provement, industry and commerce, protected by \$96,000.

the wisdom of an enlightened and liberal government, and supported by the public spirit of an enterprising nation, are already the admiration of all Europe, and where, to arrive at the highest degree of national wealth and prosperity, nothing more is wanting, and nothing can be more desirable, than the greatest possible multiplication and facilitation of internal communications.

By adopting this plan instead of the ordinary English system, the iron rail-way between Baltimore and the Ohio, the construction of which is already decided upon, might be established with much greater advantage, and with a saving of nearly two millions of dollars.

It has lately been proposed to unite the Chesapeake Bay with the Ohio by a canal between Georgetown and Pittsburg, and the expense of this canal is previously estimated at 22,575,426 dollars, of which sum nearly one-half will be required for the middle section alone, on account of the great number of locks and a most expensive tunnel by which this part of the canal is to be conducted over the highest point below the summit of the Backbone mountain. As far as I am able to judge by the report transmitted by a message from the President of the United States and published at Washington last year, it appears to me that a double track of iron rail-ways with a sufficient number of stationary engines, executed in the most complete and solid manner, would answer the purpose infinitely better and save about two-thirds of that sum and as much of the time required for the conveyance of all articles from one point to the other. Light vehicles with passengers and mails might be transported upon this rail-way with the greatest safety and convenience in 36 hours by day and night. Besides, there would be the very important advantage, that the rail-way could be used the whole year with very few interruptions, whereas the navigation upon canals in that climate is generally confined to eight menths. If, however, my plan would be adopted only for the middle section upon the length of seventytwo and a half miles, a saving of seven to eight millions might easily be made, and the traffic carried on with much greater expedition. But as in this case, the loading and unloading from the canal to the rail-way, and from the rail-way to the canal, would be rather troublesome, and attended with extraordinary delays and expenses, I should whole line between Georgetown and Pittsburg, by which about 15 millions of dollars would be saved, the whole work finished in a much shorter time, the expense of entertaining and repairs greatly diminished, the transports rendered more expeditious and convenshare-holders might be doubled even with lowering the

A gentleman with a team of dogs has travelled from Boston to Providence, where he was seen going at the rate of five miles an hour.

Last year 10,444 casks and 689 half casks of Flax-seed were inspected in New York city, worth

REFRIGERATORS. (Continued from page 218.)

The preservation of ice and the economical use of it, depend on the application of principles so nearly similar, that a treatise on ice-houses ought to lead to an understanding of the construction and use of Refrigerators (this being the most appropriate term I have thought of for the machines intended to be here described) and the common method of defending our bodies from the inclemencies of the atmosphere by clothing, if attended to, will instruct us in both.

Heat is supposed to be excited or generated in animals by the continued action and reaction of the vessels; if then it is continually generating it should be conveyed away, or the system would soon be destroyed: on the other hand if conveved or extracted faster than generated, the system would also be destroyed by the contrary extreme (to wit) the fixidity of all its fluid parts. Nature alone has defended brutes from the effects of these two extremes, and nature and art combined have effected the same thing for man. The surrounding atmosphere serves as a conductor to carry off the surplus heat; but when the atmosphere becomes so cold as to absorb it faster than it is generated in the body, in order to prevent inconuse of clothing, which renders its escape from the body more difficult.

Now if we can by any means in summer, reduce the temperature of a portion of atmosphere a little below 500 of Fahrenheit's scale, and can enclose the same with such a clothing as will prevent any accession of heat from without, we have to the same temperature will not putrify; and if we can still reduce the temperature, to a little below 32° and preserve it so, we shall then have one in which water and some other liquids will freeze. To effect these purposes at a small expense has been the object of my inquiry; and I may say I have succeeded quite equal to my expectations.

I knew that if a tight vessel composed of some good conducting substance was surrounded on all sides with ice, that the heat of its contents whatever they were, would pass rapidly through its sides to the ice, until either the ice was all melted, or the vessel and its contents were reduced to the same temperature: but then, while this proweather, would also receive large quantities of heat from the atmosphere; so that to preserve a vessel and its change of contents in this situation, would require such a quantity of ice as to render it both troublesome and expensive; it therefore appeared necessary to contrive such a covering for the ice, as would defend it as much as possible from any heat, except what was received from this, and at the same time to have a vessel of a convenient shape, I had a cedar vessel made in as top; in this was fitted as large a straight sided tin vessel as it would contain, open at the top :-This of course left interstices between the sides of the tin vessel and the wood, and also at the ends: the interstices were covered , by an edging of tin, which was soldered to the upper edge of the tin vessel, and extended on to the upper edge

top, would have been better of wood.) Through of a few pounds of ice, fresh provisions may be this last was cut a hole about an inch and a half preserved, butter hardened, milk, or any other square on each side, for the purpose of putting in liquid preserved at any desired temperature; ice. Over the whole was fitted a wooden lid fastened by a hinge on one side. A coat or case was then made for it (the whole vessel) which consisted of coarse cloth lined with rabbit skins, the fur side next the cloth and the pelt next to the wood. The coat was in two parts for the preserve their unsold meat without salting, with convenience of raising the lid; the part attached as much certainty as in cold weather; and I have to the lid had an edging which hung down all round, and covered the joint when shut.

This being only an experiment, was made on a small scale; the tin vessel being only 14 inches is absolutely necessary that a certain portion long, 6 wide and 12 deep: It was used for carrying butter to market, and contained 22 lbs. Be- haps for all, it will be found eligible to alter the fore the butter was put in, small lumps of ice were arrangement of materials, and also to make use of introduced through the holes into the open spaces lest between the sides of the two vessels; the butter, weighed off in pounds, was by a peculiar and very expeditious mode of printing formed into the shape of bricks, with a device and initial letters in cypher on one side; these being wrapt separately in linen cloths as usual, were put in edgewise: The first tier always became so hard in a few minutes, that the remainder might be built upon it without injuring the shape. When all was in, venience from the change, art has introduced the pieces of cloth were laid over the holes made for fastened. In this condition it was put into a carriage and carried twenty miles to market; but because there was always butter put up in the usual way, and other things to take at the same time, it was cumstance, there would have been no occasion a refrigerator in which fresh meat when reduced for going in the night. The butter in the hottest weather was always delivered so hard, that it was difficult to make any impression on it with the finger. Sometimes, after having been exposed in market and frequently opened, when all was sold out, it has been again filled with other butter so soft as scarcely to admit handling, which in a little time has been taken out nearly as hard as the other; and after this ice has remained in the machine most of the day. When the ice is melted, the water is drawn off at the bottom, or poured ont at one of the openings in the top.

The quantity of ice made use of in these experiments, was not fully ascertained; but was proved to be at least twice as much as would have answered the purpose, bad the spaces left cess was going on, the ice, if exposed in warm for it been only half as large. The whole cost of this machine was about four dollars: The hutter always commanded from 4d. to 51d. per lb. higher price than any other butter in market; so that four times using it paid the cost.

In this machine, the heat passes freely from the butter through the tin (which is a good conductor) to the ice, and the ice being surrounded by several good nonconductors, it can receive but little in the thing intended to be cooled. In order to do any other way. The nonconductors are first, the cloth; secondly, the fur on the rabbit skins; thirdly, the thin sheet of air confined between the pelts the form of an oval tub, nearly as wide at bottom and the wood; and fourthly the wood itself. Yet through all these, a small quantity of heat will find its way; which we are to expect will be the case in any arrangement that can be made; but with proper care the quantity will be so small that its effects may be easily overcome.

The following are some of the useful purposes to which the machine may be applied, besides the of the wooden vessel, to which it was nailed; (but one already mentioned. Every housekeeper may

this edging which connected the two vessels at have one in his cellar, in which, by the daily use small handsome ones may be constructed for table use, in which liquids, or any kind of provisionsmay be rendered agreeable, as far as it is possible for cooling to have that effect. Butchers, or dealers in fresh provisions may in one of these machines. no doubt, but by the use of them, fresh fish may be brought from any part of the Chesapeake bay, in the hottest weather, and delivered at Baltimore market in as good condition as in the winter season. But for some of these purposes, and persome other kinds; particularly for those which are large and are not intended to be often removed.

(To be continued.)

From Loudon's Gardener's Magazine.

PARIS HORTICULTURAL SOCIETY.

A Meeting of the Horticultural Society of Paris was lately held, at which we were present. The forms observed in conducting meetings of the Society, differ from those of the Horticultural Soputting in the ice, and the lid shut down and ciety of London only in two or three particulars of minor importance. The papers presented are not always read by the secretary; but by the writer, if he is a member, and present, or by the friend through whom he has transmitted it to the carried in the night; had it not been for this cir- Society. Discussions on the subjects read, which rarely, or never, take place at the meetings of the Horticultural Society of London, form a leading feature in the meetings of the Horticultural Society of Paris. On the present occasion, there was, first, a great deal of controversial discussion on official matters, such as the number of copies of the Annales that ought to be printed; next, a paper was read on the culture of the Patate, or sweet potato (Convolvulus Batatas, Lin.,) which gave rise to a variety of observations of considerable interest in a professional and scientific point of view. The author of the paper was not aware that the Patate had been, for a long time, cultivated in France, till the Comte Lasteyrie and M. Boursalt mentioned the places where they had seen it grown 50 years ago. The writer, M. Loiseleur-Deslongchamps, stated, and the fact was confirmed to us by M. Lacroix, that exposing the tubers to a dry air, like fruit in a fruit-room, had succeeded better with M. Vilmorin than any other method. We mention these, to show in what way discussion becomes really useful. We have seen discussion maintained in a similar manner, and attended by similar results, in the Zoological Club of the Linneau Society of London.

A very interesting account of the anniversary meeting of the Caledonian Horticultural Society, was read by the Chevalier Masclet, partly translated by him from the Scotsman (a newspaper held in great esteem here, for its liberal and extended views.) and partly from a private communication from Mr Neill. It was rendered particularly interesting, from the manner in which M. Masclet connected it with the subject of the education and moral improvement of the laborious classes; the great superiority of Scottish gardeners being attributed to their advantages, in this respect, over the gardeners of other countries. In the discussion which arose on this subject, the Comte Lasteyrie and the Chevaliers Soulange-Bodin and Byerley, noticed in a general way, the advantages which must necessarily result to the arts in every country, from the better education of those who are the operators in these arts; glanced at the progress which had been made in the diffusion of useful education in France; and strongly urged the necessity and advantages, not only of encouraging practical gardeners of every description, by premiums and other honorable distinctions, to become better cultivators, but to encourage the young men to become reading and thinking workmen, and the fathers of families to use every exertion to educate their children as the greatest and best service which they could render them .-M. Soulange-Bodin, who is a man of considerable eloquence, made some very impressive ohservations on the subject, and recommended members of the Society to lend and distribute the Annales, and other useful gardening publications, among their neighbors, and to every gardener who could make use of them. M. Boursault used various arguments to prove the beneficial influence of garevery enlightened individual to promote a , taste for it, as a source of social improvement, and of general amelioration. The Chevalier A. A. du Petit-Thouars made some interesting physiological remarks on the result of an experiment which he had made on the stem of a tree; clearly proving that the sap which returns by the bark and liber has the power of forming wood, without the aid of the alburnum; but the details we reserve till we return, and can illustrate the subject by an engraving.

The articles exhibited were chiefly dahlias. some implements and models of implements, drawings of different varieties of the Patate, &c. M. du Petit-Thouars gave away thirty or forty copies of his Cours de Phytologie, and some other papers were distributed. Professor Decandolle was present, and Mrs Yosy. The national characteristic was exhibited towards this lady, who, though an entire stranger, and arriving some time after the Meeting had commenced, was most graciously received, conducted to a seat close to the president, and, when M. du Petit-Thouars proceeded to distribute his pamphlets, he presented the first to Mrs Yosy.

The most remarkable thing which we have yet seen in the neighborhood of Paris, is the establishment of M. Soulange-Bodin, at Fromont. As this is the travelling season with nurserymen, we would recommend all of them who can spare time to visit France, to go thither, and see the art of grafting, and especially the greffe a la Tschoudi, pushed further than it has yet been in any establishment either in France or Britain. In rare exotic shruhs, we are inclined to think M. Soulange-Bodin will soon be able to undersell every nursery in Europe. We shall discuss the subject of this establishment in our next Number, which we intend to devote entirely to giving some account of the tour which we are now making. In the mean time, we set off for Chantilly, Morfontaine, and Ermenonville (which we have not seen since 1815,) to try if we can find at these places any thing worthy of laying before our readers; hoping that, as we are now incessantly occupied for their a proof of it before it goes to press, will be an ex- 1826, p. 77.

cuse for us, both in France and England, for the inacuracies, or seeming carelessness of expression, which it may contain .- Editor.

Schabzieger Cheese is that species of Swiss cheese made by the mountaineers of the Canton of Glaris, and readily distinguished by that peculiar marbled appearance, and aromatic flavor, communicated by the pressed flowers or the bruised seeds of the Melilotus officinalis. The practice of mixing the flowers or seeds of plants with cheese was common among the Romans; thyme was generally used by them. That a similar method was pursued in the middle ages is apparent from an anecdote told of Charlemagne.-When travelling without attendants, he arrived at a bishop's palace: it was a fast day, and the bishop, having no fish, was obliged to set cheese before the monarch. Observing some small specks (parsley seed) in it, and mistaking them for rotten parts, he took the trouble of picking them out with his knife. The bishop told him he was throwing away the best parts of the cheese; on this the monarch eat it as it was, and liked it so much, dening on society generally; and the duty of that he ordered the bishop to send him, every year, two cases of such cheese to Aix-la-Chapelle; and, in order that the cheese-merchaut might not send cheeses without the seeds, he directed the bishop to cut each in two, and afterwards to fasten the parts by means of a wooden skewer .--Foreign Review.

The Art of improving the Quality of Fruits is said to have originated in Belgium; and while the Academy of Munich were doubting the possibility of this description of improvement, and even giving a prize to an essay which maintained the negative side of the question, the art had already made an immense progress in the Netherlands.-It is not meant that new fruits were never raised from seed before, but that the business of raising new sorts of fruits from seeds was never before undertaken on scientific principles. Chance has, at all times and in all countries, discovered new sorts of fruits from seeds which have sprung up accidentally; but it was only in Belgium, towards the latter end of the eightcenth century, that seedlings were raised in large quantities with reference to this object. The city of Mons made the first attempt, and obtained four exquisite new pears, viz. the Passe Colmar, the Beurrée Rance, the Beurrée Spence (in honor of the celebrated entomologist,) the Beurrée d'Hiver, and Les Délices d'Hardenpont. These were raised in the garden of Counsellor Hardenpont. Other amateurs have devoted themselves to the same subject, and obtained several pears of excellent quality; the Bonne de Mons, the Doyenné de Mons, and many more. M. Siart procured La Napoleon; and that learned pomologist, the Abbe Duquesne, raised, among others, the excellent Marie Louise. M. Petit pursued those researches which M. Duquesne was obliged to abandon from ill health and other causes. In Flanders they discovered the incomparable Fondante des Bois (Boschier); the Capuchins of Louvaine obtained their Pastorale; and the Comte de Colona of Malines, L'Urbaniste .-During these times thousands of plants were originated annually at Brussels, with a view of studying the quality of their fruits. The result of the whole has been published by Professor Van advantage, the great hurry in which this letter has Mons, in a catalogue dated Louvaine, 1823 .been written, and the impossibility of our seeing Messager des Sciences et des Arts, livres 1 et 2. 3 fect in length, the rough bark of which they

Cultivation of the Potato in Norway .- So slow has been the progress of this root in Norway, that Von Buch states that it was scarcely known at Bergen in 1762; a circumstance the more remarkable, as at least a century has clapsed since its introduction into Iceland, the climate of which is less favorable than that of Norway. In about twenty years the potato found its way into the Nordland, and not long afterwards was introduced into Finmark, where it has now become pretty general. The potatocs of Alten, though seldom exceeding the size of a small egg, form, nevertheless, a valuable addition to the resources of the inhabitants of Lapland. Their produce usually averages about thirty fold. In one recent instance it reached to forty-four. The price is usually from 3s. 6d. to 5s. the barrel, or sack, of four English bushels. The potatoes grown in Finmark are remarkably sweet to the taste, of a waxy nature, and in colour of a deepish yellow. Some that were sent me lately from Alten, were planted in good garden ground, in the early part of the summer, and prove to be a valuable kind of early potato. The originals were all of a round shape; the produce, however, which are good, and exceed the former several times in size, are many of them oblong, and not unlike the common kidney. The remarkable alleviation of disadvantage in respect to climate which Finmark presents, the frequent luxuriance of its indigenous plants, and the powerful vivifying influence of an arctic summer, encourage the supposition that, under proper management, its soil might be rendered far less ungrateful than is generally supposed. The culture of the potato in particular, it may be hoped, will both improve and become extended; a circumstance that, in the present almost absolute dependence of Finmark and Nordland npon Russia for a supply of bread corn, is earnestly to be desired; and, if we examine the character of the climate of the Islands and coasts of Northern Norway, the degree in which it differs from all countries under the same parallel, and the circumstance by which this difference is apparently produced, such an expectation will not appear ill-founded. Von Buch, who certainly did not form too favorable an idea of the climate of Finmark, justly remarks, that in well secured cellars at Keilvig, close to the North Cape, Hammerfest, and Alten, it never freezes; that the stream of fresh water which enters the hay of Hammerfest from the little lake above it, flows unfrozen during winter; and that the long grass, which springs among the crevices of the rocks of the North Cape itself, does not cease to vegetate powerfully beneath the snow, in the absence of the sun. - Capell Brooke's Lapland, p. 203.

The Culture of Culinary Vegetables in the Sandwich Islands, was introduced by Marini, a Spaniard, about the end of the last century. Marini formed extensive gardens, where melons and gourds of all kinds, various species of cabbage, potatoes, and other vegetables common in Europe, were cultivated with great success .- Voyage to the Sandwich Islands in 1824-25, 4to, p. 41.

Preparation of Cinnamon .- The manager of the ciunamon gardens good naturedly sent some of the cinnamon peelers to our bungalows, that we might see the way in which the spice is prepared. They brought with them branches about scraped off with knives, and then, with a peculiar

instrument, stripped off the inner rind, in long slips; these are tied up in bundles, and put to dry in the sun, and the wood is sold for fuel. In the regular preparations, however, the outer bark is not scraped off; but the process of fermentation which the strips undergo, when tied up in large quantities, removes the coarse parts. The peelers are called Chaliers .- Heber's Narrative.

Management of Bees .- We have received from Mr S. W., of Lancaster, an account of an easy and ingenious mode of managing bees, and taking their honey without killing them. A common straw hive is used in the first place, prepared by having two door ways instead of one: the first, in the front of the hive, to serve as the common entrance; the second, at the side or back thereof. which must be stopped with moss or soft paper till it is wanted. When the hive is filled with yellow deal, having a glazed window and outside separating the plants. shutter fixed thereto, to see the bees at work; of the closed one of the hive, is placed close thereto, the moss or paper stopping being first removed.

The bees will soon begin to work, and, if a good season, fill the box also, at which time it may be taken away. In doing this, "run with it to some out-house," and allow the bees it contains to return home. The queen seldom goes into the box must be carried back to the hive, and she and her companions drummed out, by gently tapping the box. In doing this, a bee-dress is necessary .- J. M. for Cond.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 6, 1829.

DEATH OF COL. PICKERING.

On the morning of the 29th ult, the Hon. TIMOTHY PICKERING departed this life, after a short illness, in the 84th year of his age. Although he died full of years and replete with honors, his death strikes us as a sudden and unexpected calamity. The deceased, in consequence of original strength of constitution, and those habits of temperance and industry which marked his character, carried into his grand climacteric all the strength of body and activity of mind which usually characterize Rampong every night, and carried away all the the best period of manhood. It was but the other day, when we had occasion to admire the firmness and elasticity of his step, the quickness of his perceptions, the tenacity of his memory, and the assiduity with which he "went about doing ian of the village. - Ibid. good." His conversation was a fund of knowledge, especially to the agriculturist, and his colloquial powers rarely if ever failed not only to entertain his auditors, but to present them with prizes on subjects connected with horticulture. something, which it was pleasant to remember, and profitable to put in practice. His public character is embodied in the annals of the age, and his biography involves a large and peculiarly interesting portion of the history of his country.

elaborate article dictated by this inclancholy occasion, which concludes as follows:

In public life he was distinguished for energy, fidelity, firmness, promptitude, perseverance, and mill for shelling dry beans, peas, &c., 1000 francs. disinterestedness

Of his private virtues there is no difference of the paper nulberry, 3000 francs,

CATERPILLARS.

Ma Fessenden—After reading your numbers a few weeks past, I have particularly noticed the remarks, that have been made on the numerous insects, which infest our fruit trees, and shall take the liberty to state some facts respecting the Catin a pot, in a hot bed in February or March-in erpillar. This pernicious insect leaves the tree in the month of June, then spins itself a shroud, reviously made, letting each pot full (of 3 plants) sembling that of the silk worm, where it remains form of a miller, and lays its eggs in the month of Too much care cannot be taken to have your August; attaching them to the small limbs or this, having a door way of the same size as that cucumbers and melons (and all vines) at a great twigs of the tree, with a kind of gum resembling distance from each other, or they will mix and wax; where they remain until the leaves begin to put forth, the next spring. The young worms then make their appearance, and their numbers increase for fifteen or twenty days.

The only effectual way to extirpate the worms, that ever I found, is to find the eggs, and destroy them, which may easily be done. When the young worms first appear, they attach a web to one side of the limb. From their eggs to the place where they build their nests, which is, generally, within three feet, you will generally find from three to five hundred in a bunch. The eggs may be found after they are attached to the trees, by particular examination, being the color of the bark of the tree.

You will receive with this a hox containing some of the eggs attached to the wood. If you examine them with care you will find them to contain the real worm.

Any gentleman wishing to gratify his curiosity respecting the caterpillar may do so hy obtaining a limb from a tree which has the eggs attached to it, and putting the end which was cut off in the ground, and watering it. The worms will make their appearance at the usual time. This should be done about the first of Auril.

FRANCIS RICHARDSON.

Chelmsford, Jan. 26, 1829.

Remarks by the Editor .- The foregoing remarks may be of much use to those who have the disposition to turn them to account. There is no prey, and was religiously considered as the guard-doubt but the best and easiest method of getting rid of caterpillars is to destroy their eggs. Mr Forsyth's directions for that purpose are as follows:

"The best method of preventing trees from being infested (with caterpillars) is to scrape the stems with a piece of bone or wood made in the form of a knife, taking care not to bruise the bark; and afterwards to wash the trees with an equal quantity of soap suds and urine mixed."

The Silk Factory, in Lisbon, Connecticut, owntook fire on the night of the 1st inst. and was entirely consumed. A small part only was insured, and the loss to the owners will greatly retard, if not entirely break up their labors in this new and opinion. All men of all parties speak of them The Imperial and Royal Academy of Florence the only silk factory in New England. interesting branch of manufactures. This was

REMARKABLE CHANGES,

Observed at Mansfield and Foxborough, Mass.

During the 24 hours ending at 12 o'clock, at noon, March 25, 1821, there were a variety of phenomena and changes of weather .- Fair and pleasant weather-gentle breezes-overcast with clouds-showers-lightning-thunder-strong wind and hail-rainbows-a dead calm-aurora borealis-freezing-snowing-wind and rainovercast and thawing-wind variable, say about 20 points of the compass.

The changes in their order of time. March 24, from 12 to 2, P. M., fair and pleasant,-

gentle breezes. 3, cloudy.

4, shower, lightning, thunder, strong wind and hail.

5. two rainbows.

6, a dead calm.

8, aurora borealis. 9 and 10, fair, gentle breeze.

11 and 12, freezing. 25, from 12 to 6, A. M. freezing, clear.

7, cloudy, thunder.

OBSERVER.

Ohio Canals .- These works are making a rapid progress towards completion. A division of the canal between Akron and Mainlon, was opened for 28 miles, last August. Another of the same length from the latter place to Dover, is far advanced. It is expected that the part of the unfinished line north of Licking summit, will be ready to receive the water in May or June. The works at the mouth of the Cuyahoga, is in a considerable state of advancement; and north of Portage summit, where the supply of water is ample, it was opened for navigation last April. The tolls collected on the northern division last summer was upwards of \$4000. Mineral coal has become a great article of transport. Wool and clothes from Steubenville now reach New York. About fifty-five miles south of Licking summit, is now under contract. Several side cuts to the canal are projected, connecting it with distant

The Miami canal in the west of Ohio, is also in a great state of forwardness. The tolls last year amounted to \$8000. Ohio bids fair to become one of the most important states of the Union.

In a letter published in the American Farmer, it is asserted that the vegetating principle impregnates the Irish Potato throughout. That in planting the cuttings of potatoes, experience has proved that cuttings without eyes, produce as good potatoes and as abundantly as cuttings that have eyes. This is an interesting discovery, which, if it holds good in practice, will prove a considerable saving of seed.

The cow belonging to Oliver Shed, of Weston, which is of native stock, that obtained the first premium at Concord the last season, and the season before the first premium at Brighton, has produced since May last, three hundred and twentythree pounds of butter.

We observe with much satisfaction that John Hare Powel, Esq. has been chosen President of the Philadelphia Society for Promoting Agricul-

ture. Mr Powel's intelligent devotion to rural affairs, and the patriotic spirit which has induced him to import into this country some of the most valuable breeds of cattle, eminently entitled him to the distinction which has been thus conferred by the most ancient society of the kind in the United States. - Nat. Gaz.

The Season .- On the first inst. Green Peas were served up at Garnier's Hotel in this city.-Lettince, radishes, cabbages, and other vegetables, are now in their prime in most of our gardens, and the rose bushes are in bloom. Last, though not least, Musquitoes are as troublesome and numerous as we have ever known them here. weather is delightful, and the fall of the leaf is the only indication of the approach of winter yet manifested to us. This will sound strange to our friends at the North, with their frozen toes, fingers, and noses! - Pensacola Gazette, Jan. 6.

A Horticultural Society has been established in Horton, Nova Scotia.

Subscribers to the New England Farmer in Nova Scotia, will find their accounts with P. J. HOLLAND, Esq. Editor of the Acadian Recorder, Halifax, where they are desired to call

Those in New Brunswick are left with Mr A. M'LEOD, Editor of the St John City Gazette.

Farmer Wanted

Wanted, an active, industrious man (a Scotchman will b preferred) to take the charge and assist in Jahoring on a farm To a person properly qualified, a fair compensation, punctua pay, and employment for several years will be given.

An entire abstinence from the use of ardent spirits, will

be required. Apply to Geo. Bacon, at Thompson's Hotel, No 9 Elm street. Feb 6

Gardener Wanted.

Wanted on a place near the eity, a single man who under stands the management of a small garden and farm. Satisfae tory recommendations will be required, and permanent employ ment given. Apply at this office.

If jan. 22.

Pear Trees and Grape Vines.

For sale by Rufus Howe, at the place of Samuel Downer, in Dorchester, 200 Pear Trees of the choicest varieties, viz : 2 kinds from the London Horticulural Society; also, large and very handsome Seckles, Ambrettes, Bariletts, and Blecker Meadow; 20 handsome black Tartareans and Remugton Cherry Trees, Plums, &c. 300, Adire Grape Vines, viz: 50 three years old Catawhas, 20 three years old Sahellas, 30 Bland's Virging; 20 Alaxwher; 90 Eligingborners, also, 90 Strong Wrise, viz: ginia, 30 Alexander, 20 Elsingborough; also, 200 Sweet Water Black Hamburg, &c.

30 varieties Roses, viz: Greville Rose, White and Red Moss Grand Duke of Tuscany, Unique, Multiflora, Provence or Cab bage, Hundred Leaf, Four Seasons, Red Damask, Marble French, Cluster, Swiss, German, Variegated, Burgundy, Double and Single White.

Dohlios, seven varieties of Double, viz: Crimson, Buff, Yel

low. Red, &c. Single do.

Tulips, a great number of varieties, viz: Bizarres, Bibloems double and single, of different colors, Parrot Bills, &c.

double and single, of different colors, I farrot Bills, &c., Hyacinths, a great variety. Persons are invited, when the Tulips and Hyacinths are in bloom, to call and make their selections. White Lilies, Pink roots, Pluk, Polts and Hulls, threk kinds Honeysuckle, Chinese, Trumpet and Sweet Scented;—handsome Soow Balt trees, Quince do., Red and White Liliacs growing on same stalk; Lagerstreeonia, India or Crape Mythe, Spira Syrongo, Fringe or Smoke Tree, Suowberry Bush Strawberry Tree.

Current Bushes, White Dutch, Red do., common white and red. Gooseberries, different kinds.

Raspberries, Antwerp white and red. Thimbleberries, white Steamberries, viz: Wilmot's Superb, Downton,-red and

white English Weed-Roseberry, three kinds native. Wanted to purchase, two to three thousand small and middling size Pear and Plum Trees, suitable for budding and grafting, Seedlings would be preferred. Apply as above, or at No. 5 Central Whari.

Rose Water.

20 demijohns double and single distilled Rose Water, made entirely from Damask Roses. The above Rose Water is con-staully for sale at Mr C. Wades Porter Cellar, No. 12, Mer-chant's Ruw, by demijohn or Jess quantity. jan. 30. 2tinF4mMlinA

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of Garcen Seeds for sale, are informed they can be furnished of Garcen Seess of the sees and in the New England Farmer office, No. 52 North Market street, Boston, with boxes containing a complete assortment of the loadin, will loave containing a comprise association or use seeds mostly used in a kettlein graden, on as favorable terms as they can be purchased in this country, nearly done up in small opports, at 6 and 12 cents each—warraned to be of the growth of 1828, and of the purest quality. Observe XTAL FLOWER SELIDs will be added on the same terms, when ordered, as well as PLAS, BEANS, EARLY WHITE SWEET CORN, &c, of dif-

IT? The Seeds vended at this establishment, are put up on a new plan this year, each package being accompanied with short directions on its management, and packed in the neatest style -Traders are requested to call and examine for themeptf

In the southcasterly part of old Marlborough, a valuable Farm, containing about 120 acres, consisting of every kind of Farm, command around 1.5 decisions, consuming and that is desirable to the enterprising farmer, a large portion of which is of the first quality, having a constant stream of water running through it; and the lood is so situated that a number of acres are capable of irrigation. On the premises is an upright two story (Boase, with four rooms on the floor, in good repair; two story House, win four rooms on the noor, in goar repeating a large Barn, 80 by 30, and in common seasons is filled with good hay. There are also on the farm, good Orchards, a part or which are in their prime; together with an abundance of Wrod, the best of white oak, fit for wheelwrights' use, or for ship timber. There are few farms capable of more improvement, or which can be carried on at less expense. The place ship timber. There are few farms capable of more improve-ment, or which can be carried on at less expense. The place will be sold at a fair price, with or without the stock and uten-sits, at the election of the purchaser. The payments made easy and accommodating, and possession may be had on delivery of the deed. For further particulars, please inquire of William Drafer, Esq. of Marlborough, of BENJAMIS WELD of Rose Jan. 16. bury, or of SAMUEL II. WELD, on the premises,

MISCELLANIES.

From the (London) New-Year's Gift.

TO A DEAR LITTLE BOY, AFTER AN INTERVAL OF ABSENCE.

BY ALARIC' A. WATTS.

I miss thee from my side, With thy merry eyes of blue; From thy crib of morning-tide, Oft its curtains peeping through; In the kisses not a few, Thou wert want to give me then; In thy sleepy, sad adieu, When't was time for bed again!

I miss thee from my side, When the dinner bustle 's o'er; When the orange I divide, Or extract the apple's core; What avails my hoarded store Of barley sugar, comfits sweet; Thou art by my side no more; Vacant is thy wonted seat.

I miss thee from my side, With thy query oft repeated; On thy rocking-horse astride, Or beneath my table seated; Or when tired and overheated With a summer day's delight. Many a childish aim defeated, Sleep hath overpower'd thee quite...

I miss thee from my side, When brisk Punch is at the door; Vainly pummels he his bride,-Judy's wrongs can charm no more! He may beat her till she's sore, She may die, and he may flee; Though I loved their squalls of yore, What's the pageant now to me!

I miss thee from my side, When the light of day grows pale; When with evelids opened wide, Thou would'st list the oft told tale, And the murdered babes bewail! Yet so greedy of thy pain, That when all my lore would fail, I must needs begin again.

I miss thee from my side In the haupts that late were thice; Where thy twinkling feet would glide, And thy clasping fingers twine, Here are chequered tumblers nine,-Silent relies of thy play; Here the mimic tea-things shine, Thou would'st wash the live long day.

Thy drum hangs on the wall; Thy bird organ's sounds are o'er; Dogs and horses, great and small-Wanting some a leg or more; Cows and sheep-a motley store-All are stabled 'neath thy bed; And not one but can restore Memorics sweet of him that 's fled '

I miss thee from my side, Blithe ericket of my hearth! Oft in secret have I sighed For thy chirping voice of mirth : When the low-born cares of earth Chill my heart, or dim my eye, Grief is stifled in its birth If my little prattler 's nigh.

I miss thee from my side, With thy bright, ingenuous smile; With thy glance of infant pride, And the face no tears defile : Stay, and other hearts beguile, Hearts that prize thee fundly too; I must spare thy pranks awhile; Cricket of my hearth, adieu!

FOR THE NEW ENGLAND FARMER.

Hypocrisy-Though so different from religion, indicates its existence, as smoke points out that of pure fire. Hypocrisy cannot exist unless religion to a certain amount is held in esteem, because no one would be at the trouble to assume a mask, which was not respectable, and so far compliance with the external forms of religion is a tribute paid to the doctrines which it teaches. The hypocrite assumes a virtue if he has it not, and the example of his conduct may be salutary to others, though his pretensions to piety are wickedness to Him who trieth the heart, and judgeth of men's conduct by the motives which led to its adop-

Good manners is the art of contributing to the enjoyment of those with whom we have intercourse, by putting them at ease, and cansing them

Ill manners are the indications of pride, ill nature, and want of sense. Without one of these defects no man will offend against good manners merely for want of being accustomed to what is called genteel society.

Job's Comforters .- Though nothing is so galling to the wounded spirit as reproof, most comforters, like the friends of Job, are apt to administer censure as the grand specific for wo.

Poverty and Servility .- The want of independence of circumstances is a severe if not an absolute check to independence of spirit.

Golden Fruit .- Trees are rented in Bengal, just as lands and houses are in this country. A mango tree produces one rupee annually; a cocoa-nut eight anas, a jack one rupee, a tamarind one rupee, a betel-nut four anas, a lime four anas.

Test of perfect Vaccination .- All persons should insist on the family surgeon using the test discovered by Dr Bryce, of Edinburgh. It consists in vaccinating ou the other arm, from the one first vaccinated. If the first has been perfect, both pustules will ripen precisely at the same time; if this does not take place, the constitution has not been properly affected, and vaccination must be repeated. This simple and easy security ought never to be neglected.

A Portuguese Beggar. Two English friends called on me one day in Lisbon, and at the same time a third gentleman, well-dressed, hair-powdered, &c. entered the apartment, (which was on the first floor.) He remained some time in the room before it was noticed that neither the visitors nor the visited appeared to own him, each party waiting for the other to introduce the produced the natural question, "Shall I have the honor to receive your commands?" which was instantly complied with by the usual whine of, "O senhor! por amor de Dios," &c.; this gentleman at the Agricultural Warehouse, No. 52 North Market Street.

heing neither more nor less than a polite beggår, who, seeing my friends were Englishmen had followed them into the house and up stairs. This, however, is nothing uncommon; and I-understand that the residents in the upper stories of the bouses (perhaps six or seven bigh) have these better sort of beggars continually knocking at their doors .- Notes on Lisbon.

It is affirmed in the London Morning Chroniele of the 15th Nov. that of "the suffering refugees from Spain, Portugal, and Italy, in that capital, one thousand were literally without bread."

It is proposed to creet stationary engines on the Liverpool and Manchester Railway, which, if it succeeds, passengers can travel the road, 32 miles for I shilling, leaving a handsome profit.

A meeting of citizens in favor of taking measures to procure an extension of the Blackstone Canal from Worcester to Fitchburg, is invited to be held at Whiting's tavern in Sterling, on Monday the 9th day of February next, at 10 o'clock, A. M.

For Sale.

eourse, by putting them at ease, and cansing them to be pleased (not with you, but) with themselves.

H., formerly occupied by Esq. Emerson as a tavern, containing about 220 acres of good land, well proportioned in nowing, illabout 220 acres of good land, well proportioned in mowing, in-lance, orchard, pasture rand wood land, with a fine growth of su-gar maple. The farm is pleasantly situated on the great road leading from Boston, Mass. to Charlestown, N. II., and has on it, a large dwelling house, three barns, a cider mill and house, with other not buildings, all convenient and in good repair. It would be exchanged for real estate in the neighborhood of Dan-vers, Mass., or sold on very liberal terms. For more particular information, apply to Joel Wright, en the premises, to Abel-

Stacy, of Stoddard, or to

But, on turnpikes, as generally strap well prepared in this manner, will never be constructed in the United States, two horses can content with any other. rarely draw more than 14 cwt, each including the weight of the wagon. In other words the power of a horse on the proposed railway in its steepest part if compared with the power of a horse on a common turnpike is as 14 cwt. to five and an half or six tons.

(To be continued.)

FOR THE NEW ENGLAND FARMER.

there are, perhaps, some items, which may be of subject. service to your readers.

BEE MOTHS.

The sagacity of man enables him to discover the peculiar habits, which instinct leads the subordinate creation to adopt for self preseg and his inventive faculty frequently sug him, some mode, by which the distinction of such as are noxious may be conducive Thus we discover that destruction. teaches the Bee moth to secrete herself d ring the eat but little, and soon became so weak as to reel day, in the corners of the hive. All, erefore, in walking, breathed very hard, and discharged necessary to be done, is to take such adventage of such immense quantities of putrid matter from his this fact as that this most pernicious enemy shall nose, that we supposed the internal parts of his rush to its own destruction. For this purpose let head were perishing. By the advice of a large the orifice of the hive be 4 inches wide, and one owner of eattle, I freely applied spirits of turpeninch high. At the commencement of the season line on the top of the head, along the roots of his for the moth, place a shingle on the bottom or horns, for a number of days with apparent sucfloor of the hive. You will find in the morning cess, as he soon began to feed well, and in a few that almost every moth has taken refuge under it. They are thus readily despatched. This is the mode I have practised with my own bees, and not a single hive has ever been injured.

A THRIFTY BEAN.

In the summer of 1827, I discovered among my bush beans a single vine remarkably thrilty, and throwing out runners. I crected a pole at the place, and the vine was trained upon it. It grew during the summer with the utmost luxuriance and beauty, attracting notice from every passing traveller. When arrived at maturity it presented a complete congeries of pods. The number of and streets by hundreds, to the circumstances of beans from the vine was 1223, and the weight of their having been planted too deep. As he is pro- $1\frac{1}{4}$ lbs. In the same ratio of increase I should fessedly a student in the school of physiology, I have had, this fall, 15283 lbs. or 1,495,729 beans -and in the autumn of 1829, 1,869,6611 lbs. or 1,829,276,567 beans.

RAZOR STRAPS.

Take a common strap either new or old .-Spread a small quantity of oil evenly on the side and you wish efficient. Then sprinkle on the same side a very little white oxide of tin. Rub it over and convert it into aliment for the tree. the whole surface carefully with the finger. The fine dust will adhere to the strap. The coarser system of roots; those are few in number and ex-least, is said to be one of the most euchanting parts may be removed by the breath and the fin- tended in length, and are necessarily very much scenes in the world, and America, Siberia, Italy, ger. This forms the best possible strap-as it is shortened and diminished in taking up. HORN AIL IN CATTLE.

MR FESSENDEN-I found the receipt in your aper, of January 9th, for the cure of the horn ail be ineffectual, by experiment on an ox, last pril. In the month of October, one of my oxen in high flesh, appeared to be unwell, refused to weeks I sold him for market. It is a severe remedy, throwing the animal into extreme agony.

Yours respectfully, THOMAS HAZEN.

Norwich, Feb. 1, 1829.

From the New York Farmer.

ORNAMENTAL TREES IN NEW YORK. MR EDITOR-The learned and respected Corresponding Secretary of the Horticultural Society, has ascribed the failure of the ornamental trees, which I apprehend have been more fatal than the one he has noted. They are

1. The ill adaptation of trees taken from the forest to insulated and open exposures.

2. The want of fibrous roots to supply food;

3. The want of leaves to elaborate this food,

Trees growing in the forest have, first, a bad stance best adapted for this purpose. The white left behind, or dried up ere they are planted. The rity, is the success which has there attended the

scientific men, and professed engineers, that on oxide of tin (pulvis stanni) is found at most apoth- trunk and branches have besides been shielded

Roots are to the plant what the mouth is to the animal-they are the organs of absorption or mastication. For want of the usual supply of juices, through these, the sap vessels which convey the food to the leaves, are no longer disturbed, but become contracted and callous; and the plant ing land, and to present some ideas and plans faints like the mozzled ox in a rich pasture. For want of the food which surrounds, and which is destined to nourish them, but which neither can take, the plant, like the animal, must die.

The New-Yorkers are like the novices who frequently apply at nurseries for trees that will bear unreasonably large, generally, I should judge, from the forest. They cannot wait for the slow but sure operations of nature; but are disappointed in their attempts to counteract her laws. To counterbalance the diminution which the roots of their large trees necessarily undergo, they reduce the top to a corresponding size, by lopping off the branches, and with most of the leaf-buds destined and essential to convert the sap into aliment .--Thus the natural circulation, which can alone impart health and vigor, is nearly destroyed; and if the plant lives, it must struggle for years, ere its organs and growth regain their pristine vigor.

I never knew death to ensue from planting a tree a few inches lower in the earth than it formerly stood; and I have now in my grounds an apple tree and a pear tree, living and growing, which have had from 18 to 24 inches of earth round their trunks for twelve months at a time.-Plants will not die from partial inhumation of their stems, otherwise the hilling of our corn and potatoes would destroy these valuable crops.

The remedy for the evil complained of, will be found in the selection of smaller trees, from nurseries or cultivated grounds, where they are furnished with better roots than those from the forest-and when they can be taken up with their roots more entire; to have them grouted when taken from the ground, and their roots kept moist till replanted-and in leaving their branches nearly entire for the first year. With these precautions and good planting, forty-nine out of fifty would live and grow.

Those of your readers who have been in Philadelphia, Troy, Ithica, and Cortland, cannot have which have been annually planted in your parks failed to remark the beautiful and comfortable appearance which ornamental trees give to the streets of those cities and villages; nor to have learnt, if they made the inquiry, that these trees beg leave to suggest to him three other causes, were put out when of reasonable size, and suffered to retain their limbs and lungs. Two good stakes, or scantling, set in the ground, with a few strips of board nailed transversely, make an efficient and often neat protection.

J. BUEL. Dec. 14, 1828.

CULTURE OF THE VINE IN THE CRI-MEA.

The valley of Soudaksk, especially towards the

1804, at the suggestion of the celebrated naturalist, Pallas; the situation's named Gudjakol, in the territory of Kosi. Cuttings of vines were brought from France, Zante, Tenedos, the Rhine, Astrachan, and Kizliar; and two Frenchmen, the one a vine-dresser and the other a farmer, were appointed to plant and to manage them. Ten orphan pupils, from the military school of Cherson, were put under the care of these cultivators; govpart of the undertaking; and 28,000 vines were planted, which, in the year 1826, produced 1500 vedros of wine of Hungary, Bourdeaux, the Rhine. Asmalhausen, Muscat, Petit-Burgoyne, Zante, and Kakour, of the best quality .- Bul. Un.

[We copy the following from the New York Enquirer, of the 27th inst. The pear ripens in November, and is alluded to in the New England Farmer, current volume, page 198.]

LARGE PEAR.

Sin-I saw with pleasure that in your paper of the 22d inst you gave an account of a gigantic Pear, presented to the Royal Horticultural Society of Paris. The measures are different from the true size of the pear, which I have received of a member of the committee of said Society, which are as follows :- circumference, 13 inches and two-thirds, in the place of 15 inches; height, 8 inches, instead of 9 inches; the weight I pound 6 ounces, in the place of 1 pound 9 ounces. The trees are sold at 5 francs each in Paris; I have received six of that kind by the late arrival of the Bayard, which are the first introduced in this country; the gentleman who has had the goodness to direct them to me, writes me that this pear is of the first quality, as well for the flavor as for A. PARMENTIER,

Horticultural and Botanical Gar-) den, Brooklyn, Long Island.

Receipt for making Compasition Cake .- One of brandy.

Tea Cake .- Three cups of sugar, three eggs, one cup of butter, one cup of milk, two cups of flour, a small lump of pearlash, and make it not poppy. The capsules are of the size of a large quite as stiff as pound cake.

Clove Cake,-Three pounds of flour, one of butcloves-mix it with molasses.

Sore Throat from Cold .- At this season of the remedy cannot be prescribed for a soreness or in-them. flammation of the inside of the throat, which often attends a severe catarrh than the following;

Mix a wine glass full of good calcined magnesia and honey, to the consistence of paste, or jelly, for a day or two. It is cooling, healing, and a very gentle cathartic .- Bermuda pa.

To dry Cows, which you wish to fatten .- 'Take an ounce of powdered alum; boil it in two quarts of

may, at no distant period, produce wine enough give her the rest by way of drink; milk her clean which is indicated by the water's assuming a yelin the Crimea for her own consumption. The before you give it to her; and as you see need lowish green tincture. The leaves are then taken first vineyards were planted there in the year requires repeat it. Draw a little milk from her out, and the solution suffered to remain a few minevery second or third day; lest her udder be overcharged .- Monk's Agricultural Dictionary.

From the Mass. Agric, Repository.

ON THE CULTIVATION OF THE POPPY FOR THE PUR-POSE OF PRODUCINO OPIUM.

"Messrs Cowley and Staines, of Winslow, Buckinghamshire, have cultivated poppies for opiernment supplied the necessary capital for every um, with such success, as to induce the belief, that this branch of agriculture is of national importance, and worthy of support. In the year 1821 they procured 60 lbs. of solid opium, equal to the best Turkey opium, (quere?) from rather less than four acres and an half of ground. The seed was sown in February, came up in March, and after proper hocing, setting out, &c., the opium gathering commenced at the latter end of July. The criterion for gathering the opium was, when the poppies having lost their petals were covered with a bluish white mould. [With great deference, we should say that the directions would have been more clear, if they had stated the size of the capsules or seed vessels when the gathering began.] They are then scarified, [or scratched with a pin or knife, Eo.] and the head left till the juice is coagniated, about two hours, when it is removed, and new incisions made. Opium is produced until the third and fourth incisions, and in some instances till the tenth. Ninety-seven pounds were presured at an expense of (one hundred and fortyfive dollars) and this being dried in the sun, yielded above sixty pounds of opium. The heads of the poppies were then allowed to dry, and were thrashed, and the seeds, it was expected, as they weighed thirteen hundred pounds, would produce seventy-one gallons of oil. The oil cake was given to cattle and pigs, with great advantage."

REMARKS.

If the cultivation of the Poppy for opium can be considered as an object of national importance in Great Britain, it seems to be certain that it pound of flour, one of sugar, half a pound of must be so here. Our climate is much better butter, seven eggs, half a pint of cream, and a gill adapted to this plant. Sown in May, its capsules are fit to use in July. They are larger and finer than in England. The variety from which the Turkey opium is obtained is the large single white pigcon's egg. When they have obtained their greatest size, the capsule is to be slit with a pin, or sharp penknile; from the wound issues a milky ter, one of sugar, three eggs, two spoonfols of kind of juice which in two hours thickens, and should then be collected and afterwards dried in the sun. In raising it on a great scale, the poppies should be sown in rows or beds, so as to peryear, when common colds are prevalent, a better init the collectors of the opium to pass between

We have no expectation that such extensive experiments will be made in our country, but many curious persons may be disposed to raise a quarter of an acre each. The remarks which and take a spoonful once an hour through the day have been made are the result of personal observation by

DUTCH METHOD OF EXTRACTING BLUE COLOR FROM WOAD.

The leaves are put together with water into a ful of sage, and boil it in the whey till you reduce state they are suffered to remain for sixteen or Nat. Journal.

vulture of the vine; it is even thought that Russia | it to one quart; rub her udder a little with it, and | eighteen hours, or until the saturation is complete, utes, in order to precipitate its earthy particles; it is then filtered through a sieve of iron wire, horse hair, woollen or silk, and afterwards stirred violently for a quarter of an hour with a wooden spatula.

At this stage of the process a quantity of lime water is thrown into the extract, and the stirring is continued for some minutes longer, after which it is suffered to repose for several hours. 'At length a beautiful blue sediment will become deposited at the bottom of the vessel, and nothing farther is requisite than to filter, and afterwards dry it in small heaps on a wooden table by the rays of the sun, in order to bring it to a dry and marketable state. - Bulletin des Sciences.

[From Fessenden's New American Gardener.]

GARDENER'S CALENDAR.

February .- Manure may be carried into those places where it is needed, left in a heap, but not spread. Wherever and whenever the snow is off the ground, rake together and burn the haulm, or whatever may remain from the last year's crop.---Straw mats for the hot-beds, pales, rails, lattices, or trellises for espalier trees, should be got in readiness. See that your garden tools are in good repair, and procure such new ones as may be necessary. It is now time to set about procuring and preparing materials for, and forming hot-beds. Clean trees from moss, and protect them against mice and rabbits by whitewashing with lime, or smearing with some composition which is offensive to those vermin. Enter in earnest into the business of forwarding various kinds of seedling plants, by artificial means, so that they may have strong roots, and arrive at some size by the time they would naturally make their first appearance above ground. This may well be done by adopting Mr Armstrong's method, with regard to melons, mentioned in the New American Gardener, page 202. Attend to your fruit in your fruit-room or cellar, on shelves or in boxes, and, if necessary, pick it over, and cull out whatever is defective; wipe the remainder dry, and pack it away anew. But if it is put down in some sort of grain, dry sand, flax-seed chaff, or, what is probably best of all, pulverized plaster of Paris, you will not need to meddle with it. You may now, perhaps, begin to force asparagus in hot-heds. Sow under glass cases, for transplanting or otherwise, radishes, carrots, small salads, peas, beans, &c. Protect choice plants, which may show a disposition to vegetate, by matting, litter, cases of wicker, old bark, and other proper means.

A correspondent of the Palladium relates that a person in Boston, whose system had contracted a propensity to dropsy from sedentary employment, and whose limbs had become so much enlarged as to burst the skin, has been lately cured entirely, by laving the legs in cold water.

Pure Glass .- It is stated in the Literary Gazette, that Mr Herschell and Mr Faraday have at last succeeded in their long practised series of experiments for producing pure glass for optical purposes. It is believed that the attainment of this most desirable object will produce extraordinary milk till it turns to whey; then take a large hand-cask, and the mass loaded with weights. In this results in the highest of all sciences, Astronomy.—

REFRIGERATORS. (Continued from page 228.)

After constructing and using the Refrigerator which has been described, as its usefulness depended entirely on a supply of ice; I was naturally led to reflect on the most economical means of preserving it, and hence the foregoing investigation of the subject. In the course of that investigation an improvement in the Refrigerator occurred. I clearly discovered, that agreeably to the laws of heat, any refrigerating body placed in the upper part of a chamber defended from external heat, would certainly receive heat from the atmosphere of the chamber, until a common temperature was produced. I therefore concluded that if a small tin vessel was attached to the under side of the lid, of the Refrigerator, to contain the ice only, and the lid made to slide instead of raising up, that the large tin vessel might be spared; which would certainly be a great improvement, especially as in that case there would be no absolute necessity for the wooden vessel to be water tight, and some difficulty attends keeping any other than a hooped vessel in that condition. In order to prove by experiment as far as I had convenience for doing it, I removed the tin vessel from the refrigerator and placed a vessel containing water, and another milk on the bottom of the wooden vessel, one at each end; I then fixed a pewter bason containing ice and salt, as near the top as I could to admit the lid to shut over it. found both water and milk began to freeze in about an hour; and by letting them remain some time longer they were both frozen to the bottom; the temperature of the room about 550. Having never before seen, or heard of any liquid being frozen by means of ice and salt in a temperature above the freezing point, in any other way than by placing the vessel containing the liquid intended to be frozen in contact with the mixture : this experiment as far as it went was encouraging .-Some days afterwards the temperature of the room the same, I fixed the bason containing ice only, as before, and made use of a thermometer to try the effect. I was now disappointed by finding that I could not by this means reduce the atmosphere within the vessel as low as the ice by 6 or 80. But on a little reflection the cause was very plain. The nonconductors enclosing that portion of atmosphere, were not so perfect but they admitted some heat to pass through, and this continually mixing therewith, before it could be taken up by the icc would of course always occasion a difference in temperature. This plan will not therefore answer the purpose as well as the other, either when a great degree of coldness is required, or when it is necessary to produce immediate effect. But for those on a large scale, such as would be proper to stand in cellars, or the holds of vessels, I think this last mentioned kind is to be preferred.

The following 1 think would be an eligible mode of construction. Suppose it is required to have one whose content shall be equal to six cubic feet clear of the ice vessel; let a box of wood be made three feet long two feet wide and sixteen inches deep in the clear; let another box be made of such dimensions that the first may stand within it; leaving an interstice between, on all sides, and also between their Lottoms of about an inch .-The sides and one end of the outside box should also stand an inch or more above the other .-Then put as much dry sifted ashes, or rather

as will cover the bottom an inch deep; set the ice multiplied by 43 produces 140 pounds of the small box within the large one, leaving the space article to be cooled: if we strike off the fraction equal on all sides. Then prepare a fid, which 2, which will be just 1 of the ice on account of may rest on the top of the inside box, after thin that portion of external heat which will find its strips are nailed on the upper edges thereof in or- way in while the articles are cooling, we shall der to cover the spaces left between the boxes; then have 120 lbs. This is much more than althe edges of the lid confined by a ledge nailed to most any private family would have occasion to the outside box, or by a groove, and made to slide put in daily, for the use of the family only. There endwise; cut a hole of a convenient size near the middle of the lid for the purpose of putting in the heat, which would be admitted by frequently ice, and connect a door to it by a hinge. The ice vessel must then be fastened to the lid: this should be made of tin or sheet iron, about two feet long, eighteen inches wide, and four inches on the subject without more accurate experiments deep, having a convenient opening at one corner than I have yet made. I am, however of the to draw off the water, which may be stopped with a cork; the side and end plates of the ice vessel must be five inches wide, one inch of which must have a square turn outwards to admit of its being nailed up to the lid, which will form the top of the vessel. This being done it will be necessary to cut away one end of both boxes so as to admit the necessary quantity will probably be greater, the lid with the ice vessel nailed to its under side and proportionably less when cooler. to draw out. Then fill the space between the boxes at the sides and ends, with the same material used between their bottoms; nail on the strips to confine it in, and the wood-work will be finished. The whole may then be covered with coarse blanketing, duffle, or the cloth called lionskin; so cut as to admit of the lid being drawn out, and to cover all the joints when shut; at the end cut down, to give room for the ice vessel, it will be necessary to have a flap of several thicknesses of cloth, attached either to the end of the lid or box in such a manner as effectually to close the opening when the lid is pushed in.

An easier method of fixing the lid (and perhaps in most cases ought to be adopted) would be to let the top of both boxes be of equal height and fasten the lid thereon, having an opening in the middle a little larger than the ice vessel, through which it may hang down, suspended by the edges of its wooden top to which it should be nailed as before directed, the joints to be all closed by the woollen covering. The only inconvenience that would attend this mode would be an increased difficulty in opening, on account of its having to be lifted off when full of ice, but this might in some measure be remedied by having suitable handles, and for those that are to be stationary a small pulley.

Such an ice vessel as has been described, will probably contain about 30 lbs. of ice in lumps and is capable of cooling more than 120 lbs. of any kind of provision or liquids put in the average summer temperature, down to 6 or 80 below the coldest spring water. I have not consulted any meteorological tables on the subject; but believe I am safe in stating the mean temperature of this climate, from the middle of the fifth month,* to the middle of the ninth month! (which is about the time ice is useful) rather below 800. It will then require any article at that temperature to be cooled 300 to bring it to what was proposed. As it requires 1460 or thereabouts of heat to convert ice to water; then, as many thirties as are contained in 146, so many pounds of the thing intended to be cooled, will each pound of ice cool to the degree required, admitting the ice to receive no other accession of heat. For the sake of round numbers, insiead of 146, we will say 140,

charcoal dust if it can be had, into the large box which divided by 30, quotes 42; 30 pounds of are, however, some deductions to make for the opening, and also continually passing through the sides and bottom of the boxes.

But it is impossible to calculate with certainty opinion, that the average quantity of 20 lbs. of ice per day, will be sufficient in such a refrigerator as has been last described, to answer the purposes of a large family; even admitting, that with other things, the milk of two or three cows should be kept therein; when the weather is very warm,

To be concluded next week.

From Loudon's Gardener's Magazine.

The Dahlia may be advantageously forced by potting the roots in February, and letting them remain in frames till June, when they will begin to flower, and may be turned out into the open border .- Matthias Sylvaticus, October 10, 1827.

Transplanting Turnips .- For many years I have sown turnip seed on any little vacant spot, and, when the plants had two or three leaves, planted them out, by a line in regular rows .-Nothing can succeed better, or produce finer roots; hardly one in twenty dies .- Rusticus in Urbe.

A Strawberry was gathered, on the 20th of June, from the garden of Mr Norris, Brentford End, which measured 131 inches in circumference, and weighed upwards of three ounces .- Morning Her-

Utility of Toads in Gardens .- Practical men have been long aware that toads live chiefly on insects, particularly beetles; some have even made it a point to place them on their hot-beds, for the purpose of destroying wood-lice, earwigs, &c. A correspondent, Mr Reeve, who has long employed toads as guardians of his melon and cucumber frames, fully corroborates all that has been said respecting their usefulness in such situations, and is so attentive to them, that, when they have cleared his beds of insects, and he finds them uneasy in their confinement, he actually feeds them, in order to keep them there. He offers them the different insects which are considered noxious in gardens, all of which they devour; even slugs are eaten by them (though this is denied by another correspondent;) and if so, this despised reptile must be a beneficial assistant to the gardener at times, and in a way he is at present but little acquainted with .- J. M. for Cond.

Apples may be kept all the year round, by being immersed in corn, which receives no injury from their contact. If the American apples were packed among grain, they would arrive here in much finer condition. In Portugal it is customary to have a small ledge in every apartment (immediate-

CHANGES

Which take place in the Domestic Animals of Europe when transported to .Imerica .- The mammiferous animals transported from the Old to the New World are the hog, the sheep, the goat, the ass, the horse, the cow, the dog .- 1st. The Hog .-This animal, in the het valleys of South America, where he wanders whole days in the woods, living chiefly upon wild fruits, loses speedily the marks of domestication, and partakes largely of the nature of the wild boar. The year 1493 was the date of his first introduction into the New I am happy to see by your late papers, that you this business, on a small scale; and should the World; and now he is found established from 25 degrees north latitude, to 45 degrees south, and every where breeds as plentifully as in Europe.-2d. The Cow. Animals of this species appear to require a considerable quantity of salt as a part of their nourishment. When salt is placed where warded for your inspection, by the first conven- they feed, they return punctually to seek it; but when this duty is neglected by their masters, the flock disperses and becomes wild. There is also a difference in the size of the udder, particularly in Colombia, where the milk is not reckoned of the same importance as in Europe. 3d. The .9ss. The Ass suffers hardly any alteration either in his form or habits. In some places where he is overworked and little cared for, he becomes deformed, but no where does he lose his civilization. 4th. witnessed the collection of the choicest specimens | The Horse. Not so with this animal: he finds chesnuts in the woods, and speedily presents one of the distinctions of wild animals - a sameness of color, which with him is almost invariably chesnut. The amble is the pace most admired by the Colombians; they accordingly breed up their borses to this mode of motion; and it is no less remarkable than true, that with the present race the amble is the natural pace, just as the trot is with our's, 5th. The Dog suffers no change. 6th. The Sheep, in temperate climates, breeds as freely as in Europe, and never shows any inclination to escape from the dominion of man. In the warmer plains they are more difficult of preservation. The wool grows slower; but if shorn at the proper time, presents nothing remarkable. If on the other hand, this time is allowed to pass, it is dotached by the shears of nature; and instead of a new crop, growing, as in other eases, a short, smooth, shining hair presents itself, resembling and that they have spun him silk in a tempera- eties of plants and fruits, the communication of that of the goat of the same climate. 7th. The Goat, although with us a mountaineer, suits betthe more elevated parts of the Cordilleras. The only change it undergoes is similar to that of the cow .- London Weekly Review.

FRENCH METHOD OF TRANSPLANT-ING.

During dry weather, the gardeners of Paris do not wait for rain as ours generally do; but, as soon as their crops require removing, it is done in the following manner: Having chosen the spot, they well water the top, and immediately dig it under, and afterwards water the fresh surface, and as soon as it is dry enough, it is raked, and the plants put in without any regard to the mid-day sun; they continue to water the bed three or four times a day, until the plants have taken root. It is surprising how soon lettuces, cabbages, etc. will he well rooted by such treatment, and with what vigor they grow after the first shower of rain .-What would have been the state of such plants had they remained in the seed bed? They would have drawn each other; their first leaves would have dropped off, and general debility would have followed, not easy to be removed: but, by the French treatment, not a leaf will be lost. Now, if we consider the principle, it is simply this: that every plant placed in the sun in water will in no way flag, and the continued wet state of the bed for the first few days is similar to it; besides, the presence of the sun contributes powerfully to the rooting of the plants .- Eng. pa.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 13, 1829.

ADVANTAGES OF TREES.

Cattle thrive much better in fields even but moderately sheltered with trees than they do in an open exposed country. An Italian (Gautieri) has enumerated and illustrated the advantages in point of climate which tracts of country derive from woods and forests. "These" he says " are arresting the progress of impetuous and dangerous winds; maintaining the temperature of the air; regulating the seasons; lessening intense cold; opposing the formation and increase of ice; moderating intense heats; producing abundance of water in the rivers; discharging the electricity of the atmosphere; opposing a barrier to washing away or undermining banks; preserving from inundations; preserving the soil on hills and mountains."

CULTURE OF HEMP.

Mr James Rogers, who carries letters of introduction from several gentlemen of distinction in New York, is on a tour in the State of Maine for the purpose of engaging the farmers in the cultivation of hemp. He proposes to supply them with seed, sow it for them, and take a share in the crop for his compensation.

CALVES.

Young's Annals state the following as a remedy for the scouring of calves: Powdered chalk and wheat meal moistened with gin and worked into a ball should be given the animals.

COLD WATER LOTIONS.

The Vermont Chronicle says, that "a lady of feeble habits, who has been subject to heavy colds for a long course of years, has agreeably to the recommendation of a physician, for the two last

morning; and it is a fact, which may be relied on, daily. On the high pastures of Scorla, a cow that since the adeption of this antidote, she has during the best season, supplies nearly sixty pounds not experienced any cold whatever!"

The Grindalwald Alps feed three thousand is made of a mixture of ewe and goat milk; the cows and as many sheep and goats. The cattle cheese of Sassenage and Dauphiny, of ewe and are attended on the mountains by herdsmen; cow milk; it is said that a mixture of all the three, when the weather is tempestuous, they are up all cow, ewe, and goat, makes the best cheese. mght, calling to them, otherwise they would take fright and run into danger. Chalets are built for the use of the herdsmen: these are log houses of the runest construction, without any chimney, and a pit or trench for the fire dug round by way of a seat. Those chalets the persons whose employment it is to milk the cows, and to make cheese and butter, ascend in the summer time. When they go cut to milk the cows, a portable seat with a single leg is strapped to their backs; at the hour of mixing, the cows are attracted home from the mis. distant pastores by a handful of salt, which the shepherd takes from a leathern pouch hanging over his shoulder. During the milking, the Ranz dez Vaches is frequently sung.

The Swis: cows yield more milk than those of Lembardy, where they are in great demand; but

neck, and arms, profusely in cold water every cows a cheese of fortyfive pounds can be made of skim-milk cheese, and forty pounds of butter. Reckoning twenty pounds of milk, observes our author, equivalent to one of butter, the produce It has been asserted that lightning never struck in milk will be eight hundred pounds for ninety a beech-tree. But a farmer in the state of Ohio days, or less than nine pounds a day. This small supply he ascribes to the great elevation of the pastures, and the bad keep of the cows in the

CHEESE.

Great variety of cheese is made in the districts flax by steam power, is now in complete operation of Switzerland; the most celebrated in the Schabin that city, and on such a scale as to create an zieger. To make this, the dairy is built near a stream of water; the vessels containing the milk are placed on gravel or stone in the dairy, and the water conducted into it in such a manner as to reach their brim. The milk is exposed to this temperature about six degrees of Reaumur (forty six Fahr.) for five or six days, and in that time the cream is completely formed. After this is skimmed off, the caseous particles are separated by Cows, goats and sheep constitute the principal the addition of some sour milk, and not by rennet. means of support and wealth of the Swiss farm- The curd thus obtained is pressed strongly in ers; er to discriminate more accurately, the goats, bags on which stones are laid when sufficiently in a great measure, support the poorer class; and pressed and dried, it is ground to powder in authe ewes supply the cheese from which the richer tunin, salted and mixed with either the pressed derive their little wealth. The extent of a pasture flowers or the bruised seeds of the Melilotus Offiis estimated by the number of cows it maintains; cinalis (melilot, a species of trefoil.) The entire six or eight goats are deemed equal a cow; four separation of the cream or unctuous portion of the calves the same, four sheep, or feur hogs; but a milk is indispensable to the manufacture of Schabhorse is reckoned as five or six cows; because he zieger. The unprepared curd never sells for roots up the grass, [that is, destroys it by biting more than three half pence a pound; whereas, too close.] Throughout the high Alps, they are of prepared as Schabzieger, it sells for sixpence or opinion that sheep are destructive to the pastures, sevenpence. Our author is, therefore, surprised in proportion to their elevation, because the herb-that other cantons do not follow the examples of age, which they eat down to the roots, cannot, in Glaris; and he advises other aromatic herbs to he such a cold climate, regain its strength and luxu- used, and thus a variety of such cheeses manufac-

In other parts cording to them the mixture of the two kinds of the preprietors of the pastures hire their cows; milk is of itself sufficient. It is to this manageor the proprietors of the cows rent the land, ment that our author ascribes the greater delicacy The proceeds of a cow are estimated at 31., or of flavor possessed by the ewe-milk cheese of the

The celebrated cheese of Roquefort, in France.

SHEEP

Are not a favorite stock in many parts of Switzerland; the difficulty of procuring food for them in winter is one cause. M. Kasthofer, however, mentions a fact, which if uniformly the case would, in a great measure, do away this ground of objection to sheep. He was assured that sheep suffered to remain on the mountains, during winter, procure food for themselves sufficient, not merely to support life, but to keep or render them fat, and he adds that, in Norway, when winter folder fails, the sheep are turned out, and hy scraping away the snew forage for themselves; the same is the case in Iceland.

FORESTS

In Switzerland are of great use and imporafter the third generation the milk falls off. In tance; they supply the principal winter food for some pairs of switz rland they yield, on an aver- cattle &c. The author observes that the native years, adopted a custom of uniformly bathing face, age, twelve English quarts a day; and with forty trees of any district are not of course, the most

useful and profitable trees that might grow there; he would therefore ascertain which are the most useful for fodder, or profitable for timber, and these he would substitute for native trees. One of the most useful trees in Switzerland is the Pinus Cimbra, or Stone Pine; it is indeed of very slow growth; one of them, cut down when nineteen inches in diameter, displayed three hundred and fifty three concentric circles. Its usual growth is a span in height in six years. The timber of this tree has a most agreeable perfume, and is much used for domestic utensils, as well as for wainscoating rooms. When our author visited the chateau of Tavasp, he was struck in almost every apartment with the perfume of this wood; and he remarks it as a surprising and inexplicable circumstance, that the wood should have exhaled this perfume for some centuries with undiminished strength, and without the wood itself having suffered any decrease of weight. But this wood possesses another recommendation-rooms wainscoated with it are not infested with bugs or moths. Its seeds are esteemed a delivacy; they are eaten in great quantities at the winter parties; and on these occasions the female sex display, in extracting them, a high degree of skill, mixed with much innocent gaiety and vivacity. According to Pallas an oil is extracted from them which is used at table, and might be in the manufacture of soap.

In order to expedite and secure its growth, and thus remove the principal objection to its cultivation, he advises that the seeds should be deposited in a compost of earth, and the clippings and leaves of the pineaster and the larch; or that this compost should be put round the roots of the young plants .- London Foreign Review.

MASSACHUSETTS LYCEUM.

A respectable number of gentlemen of the Legislature, and others, assembled in the chamber of the House of Representatives on the 16th inst. Mr Denny, of Leicester was called to the chair, and Mr Eddy, of Middleborough appointed Secretary. A number of gentlemen spoke on this occasion, and instances were cited of the successful establishment of Lyceums in Leicester, Newton, Charlton, &c; and the advantages derived from them in presenting pupils the means of acquiring that kind of information, which will prove of the most practical utility. The following resolutions offered by Mr Rand, were unanimously adopted.

Resolved, that in the opinion of this meeting, the general establishment of Lyceums in the towns of this commonwealth would have a salutary effect upon common education, and on the best interests of the community.

Resolved, that this meeting recommend that a meeting similar to the present, be held in Boston, early in the winter session of the next Legislature,

Resolved, that a committee be appointed, consisting of three gentlemen of Suffolk county, and one of each of the other counties, to take suitable measures for collecting information preparatory to the meeting next winter.

Resolved, that said committee endeavor to obtain such legislative aid, as to them may seem necessary and advisable to raise the standard of common education, and give facility to the formation of Lyceums, for this purpose.

The following gentlemen were chosen to be the committee.

Suffolk, Messrs Rand, J. B. Davis, Bigelow-Essex, Mr Phillips - Middlesex, Mr Jackson -Plymouth, Mr Deane - Bristol, Mr J. A. Parker --

Worcester, Mr Wilder-Hampshire, Mr Hayes-Hampden, Mr Williams-Frankfin, Mr Field-Berkshire, Mr Sedgwick-Nantucket, Mr Burnell-Norfolk, Mr French-Barnstable, Mr Marston-Dukes, Mr Fellows.

Grubbing Machine.-An ingenious citizen of our state, (Mr Pratt, of Washington county,) lately exhibited, near Georgetown, D. C. the operation of his Grand Grubbing Machine. He applied the machine to some noble White Oaks, 9 feet in circomference, and they were in a few minutes, and with case, pulled down and their roots pulled up. The power used was the hands of some five or six In the southeasterly part of old Marlhorough, a valuable men. The machine, will, it is thought, prove very useful to rail road and turnpike companies.

In the southeasterly part of old Marlhorough, a valuable form, containing a soft 120 acres, coasisting of every kind of lath is desirable to the enterprising former, a large person. exhibition was made with a view of showing its effect to the members of Congress .- V. Y. pa.

Manufacture of Salt .- Mr Loring Crocker, of Barnstable, is making improvements in the manufacture of salt from sea water. He is about to throw up a high dyke around two or three acres of salt marsh, upon which he will bring the sea water, which will evaporate considerably. The water then will be conveyed to a deep trench, and from thence to the wooden vats .- Traveller.

Expectation and Circumstances .- The greatest injury that can be done to young persons is to bring them up to expectations of living in an easy independence, when it is not in the power of the parent to support it.

To Correspondents .- We are obliged to defer this week, on able and valuable article on Fruits and Fruit Trees, in reply to Mr Little's inquiries in our last paper-also one on New Varieties of Potatoes-Hints to Young Farmers-on Rose Bugs -Several interesting articles from a correspondent to Mausfield -and some Agricultural Extracts from The Foreign Review.

ELIJAH'S INTERVIEW.

BY MRS. HEMANS.

On Horeb's rock the Prophet stood-The Lord before him pass'd; A hurricage in angry mood Swept by him strong and fast, The forests fell before its force, The rocks were shiver'd in its course; God was not in the blast. "Twas but the whirlwind of his breath, Announcing danger, wreck, and death.

It ceased. The air grew mute-a cloud Came muffling up the sun; When through the mountains, deep and loud, An earthquake thunder'd on; The frighted eagle sprang in air, The wolfran howling from his lair; God was not in the stun. Twas but the rolling of His car, The trampling of His steeds from far,

'Twas still again-and Nature stood And calm'd her ruffled frame : When swift from Heaven a fiery flood To earth devouring came. Down to his depths the ocean fled, The sickening sun look'd wan and doad; Yet God fill'd not the flame. Twas but the terror of his eye That lighten'd through the troubled sky.

At last a voice all still and small. Rose sweetly on the ear; Yet rose so clear and shrill that all In heaven and earth might hear. It spoke of peace, it spoke of love, It spoke as angels speak above. And God himself was here, For, oh! it was a Father's voice. That bade his trembling world rejoice.

FOR THE NEW ENGLAND FARMER.

Dress .- There is a certain dress suitable to every station, which to neglect would be sinking into meanness, and be a disrespect to those we live among. But nothing can be more dangerous in the education of children than cherishing in them a passion for fine clothes; and a desire for dressing more expensively than their associates, and in habiliments more costly than their circumstances will warrant.

Happiness is in the mind, and to improve the mind is a principal mean for obtaining it. Less happiness is gained by enlarging our possessions than by contracting our desires; and Diogenes, contented with his tub, was more happy than Alexander, weeping for want of another world to conquer.

Children's Expenses .- If you put into the hands of your child more money than is suitable to his age and discretion, you must expect to find that he has thrown it away upon what is not only idle but hurtful. A certain small regular income may be well for any child above six years of age. And when he comes to be capable of keeping an account, he ought to be obliged to do it; he will

the contrary giving a young person money to spend at will, without requiring any account of it, is leading or rather forcing him into extravagance and folly.

Fashionable Vices .- Many young men plunge into extravagance, idleness, and dissipation, not from any natural propensity to those vices, but from a desire to be or seem to be fashionable .-But vices of adoption and imitation are of all others most disgraceful and unpardonable.

Concord Lyceum .- The first Lecture before this Society was given in the Court House, on Wednesday evening last, by Rev. Bernard Whitman, of Waltham. The subject was " Popular Superstitions," and was treated in a very instructive and interesting manner. The meeting was well attended; we should think full three hundred hearers were present, some of whom came from adjoining towns. The President announced, that a second Lecture would be given, by Dr HORATIO Adams, on Wednesday evening next, at the same place .- Concord Yeoman.

Blackstone Canal. Messrs Fox, Jewelt, and Brigham, a committee of the citizens of Fitchburg, have invited a meeting of all persons in favor of taking measures to procure an extension of the Blackstone Canal from Worcester to Fitchburgto be held at Whiting's Tavern in Sterling, on the forenoon of Monday, the 9th of February. Such an extension would probably pass through West Boylston, and Leominster, and would, perhaps, eventually connect with Nashua river, which empties into the Merrimac - and thus make a half cirele round Boston.

Wild Pigeons .- Innumerable multitudes of Pigeons have been for many days passing and repassing over this town. One flock which passed over literally obscured the atmosphere, and could he observed in every direction as far as the eye could reach, and making a noise like a strong rush of wind. No ealculation can possibly be made of its extent with any degree of accuracy; but we should imagine, from the time occupied in their passage, that the foremost ones might have flown thirty miles by the time the latter part of the flock had passed over! We have no doubt but that, if the pigeons in the one flock above notieed could be enumerated, they would at least amount to as many in number as the dollars lost by the Adams man in Baltimore, in the great bet. The weather, for several weeks past, has been almost as mild as during our Indian summer.

Piqua, (Ohio,) January 3.

Fishermen's Sham Fight .- The Gloncester paper at the close of an article on the abuse of the Militia System, has the following anecdote:-"About 12 years since, a large body of our Fishermen were warned to appear according to order, and after going through the rigmarole nonsense usual on such oceasions, the regiment was ordered to prepare for a sham fight. The late Col. Haskell commanded the Sandy Bay militia, composed entirely of Fishermen, who had hardly got their sea legs off, and certainly not their military ones on. When the order of attack was given, Capt. H. addressed his men in their own language, viz: "Off mittens, hoys, and after them." And tigers like, on they rushed, with fixed bayonets, to thereby acquire a habit of frugality, attention and the horror and dismay of their opponents, who to prudence, which will last him through life. On save their bacou, took to their heels, with half a

regiment of fishermen in full chase, determined as was supposed, to do execution, and cover themselves with immortal glory! But they were stopped from their bloody designs. Not a heart was wounded, except by fear, nor a bone broken, to the eredit of the gallant officers, who were the first to run."

We learn that the Directors of the Baltimore and Ohio Rail Road Company have received letters from their Engineers now in Europe, informing that they reached Liverpool after a passage of 19 days, were in good health and had met a very kind reception from the Engineers engaged on the Liverpool and Manchester Rail Road, to whom they had taken letters of introduction and discovered the most liberal and friendly disposition to give them every information. The Engineers accompanied by those gentlemen, were, on the first ult., actively employed in their examinations.-The Liverpool and Manchester Rail Road was steadily advancing towards completion-the stock of the company, which a short time after the commencement of this work, had fallen below par, was, at the last dates, 60 per cent. premium.-Baltimore Patriot.

For Sale,

A valuable Farm in Stoddard, in the county of Cheshire, N. A fandable Family of the state about 220 feres or good land, well proportioned in mowing, ill-lage, orchard, pasture and wood land, with a fine growth of su-gar maple. The farm is pleasantly situated on the great road leading from Boston, Mass, to Charlestown, N. H., and has on it, a large dwelling house, three barns, a cider mill and house, with other out buildings, all convenient and in good repair. It would be exchanged for real estate in the neighborhood of Danvers, Mass., or sold on very liberal terms. For more particular information, apply to Joel Wright, on the premises, to Abel Stacy, of Stoddard, or to

FOR THE NEW ENGLAND FARMER.

FRUIT TREES.

MR FESSENDEN-In your Farmer of the 6th inst, there are one or two articles relating to hor-Bucksport, Maine, that merits the attention of some one better qualified than I am to answer the inquiries of the writer. But as I have a moment's leisure, and the author seems quite interested in getting some information on the subject to which his article relates, I will, with your permission, make some general remarks upon the points on which he appears most anxious, and only regret that I cannot answer his inquiries with as much certainty as he desires.

by the soil and climate in which they grow -it is difficult to state with precision what sorts will answer best in countries of which we know but little, or nothing, of either. There are, however, general rules which may be applied to all situations and soils, which may serve to govern the cultivator in some measure, and if I should extend my inquiries, I hope they will meet with his indulgence.

The article appears to be addressed to nurserythe quality of the trees to be taken from the nursery; the kinds of fruits best suited to the country he inhabits; what fruits are most prolific in themselves, and will hear best and most abundantly ;-their time of ripening, and the best mode of preserving them ;-the trees to be planted, as I understand, in an open orchard. It is, as I have before stated, very difficult to answer all these questions simply and precisely, without knowing Mr Little inhabits, than I do. But I may, perhaps, be able to give him some general hints on if I professed to know more particularly what would meet his views. And first, let me observe, that unless the trees are properly planted, and taken care of afterwards, it is of little consequence what their qualities are, or what their fruit is ;for the finest formed and most healthful trees, grafted from the best fruits, and most abundant bearers, will disappoint the expectations of the cultivator-unless these first principles are attended to.

The trees selected from a nursery should be not less than five feet high, and if six or seven feet, so much the better. Their stems should be straight, free from wounds and bruises of any kind-of a thrifty, but not too rapid a growth; clear bark, and well furnished with healthy sound roots. The soundness of the roots is easily ascertained by cutting off a small piece at their ends. If they are sound, the wood will be white-and such as are and should be cut out till you line to white wood:

ends of all your roots when you plant your trees, habits of the planters, and the nurserymen get the with a sharp kurfe. But I deep in the ground; and they should be set in the have never seen any that have been raised bere different rows, Quincunx or diamond fashion, and that were better than Greenings, although the not opposite to each other. This gives more room trees have been transplanted from the nurseries on for the roots and branches to extend themselves Long Island, where this fruit is supposed to be without interfering, while it allows each row to most perfect. I mention these facts to show how get its share of the sun and air. If your trees are difficult it is to answer Mr Little's question on more of the climate and soil of the country that planted in the fall of the year, the best mode to this point. Whether this arises from difference preserve them from being blown over by the heavy of climate, or soil, I know not, but it may be either, winds of the season, or thrown out of the ground or both. It seems to me that the most secure the subject, that may serve his purpose as well as hy alternate frosts and thaws in the winter, is to method for a farmer who wishes to make an orheap the earth round the stem till it attains the chard, is to find out the best fruits that his own form of a cone, which may be gently beaten with country affords, and those that are the best beara spade to prevent its being washed away by rains, ers. This he can determine for himself. From By this means the tree may be kept upright, and these he can engraft a portion of his trees, while firm in its place, until its roots begin to shoot, or the others, which he has introduced into his farm the weather becomes moderate in the latter part from abroad, and of which he has no knowledge of the spring or early in June, when the earth may except from report, are coming forward. In this be levelled again; and the succeeding winter this way he will be sure of having some that will suit process will be unnecessary. This mode is far him-and if the others turn out well, he will get preferable to staking them. Trees should never a variety from which he can choose, and by rebe planted in holes dug below the level of the soil grafting from bearing trees of which he has seen into the poor and hard ground, as is practised by and eaten the fruit, get as many or as few sorts many people. It prevents the extension of the as he requires for his permanent stock. I say reroots, and of course of the branches, and the trees grafted from bearing trees, because this is the only in such case are never healthy, vigoreus, and good sure mode of getting good fruit, and avoiding the bearing plants. It is by no means uncommon for vexations and disappointments that are inevitable farmers and gardeners too, to dig deep holes in the when we depend on catalogues; for the best inground into which they eram the roots of the tree, tentioned and mest honest nurserymen, of all counwhere they are confined to a narrow space, and tries, are frequently deceived themselves, both as in any degree brown within the bark, are diseased, correpted by stagnant putrid water, which is con- to the quality and varieties (or kinds) of froits that fired round them in the hard pan or gravel which they offer for sale. This arises sometimes from the cut should be always a little sleping on the forms the wall of their prison. Many trees are mistakes, and sometimes from the carelessness of

the budders or grafters in nurseries. Sometimes from the nurseryman himself having been de- have adopted. ceived by those from whom he has imported his trees, and sometimes from the ignorance we are under as to the real and proper names of fruits that we see. In different places the same fruit is called by different names, and even gardeners and nurserymen who have been for years engaged in their vocations, and who ought to possess a correct nomenclature, frequently confound all distinctions, by adopting any name that is popular, or which may have been given to a particular fruit by the person from whom they receive it. When, therefore, you want to be sure that you have a good fruit, take the scions from a bearing tree, the fruit of which is known to you, and do not trust to the reports of others any further than necessity prescribes. By this means you may save much time and avoid much vexation and disappoint-

I will state a fact which will show how much we are exposed to this evil when we depend on the reports and representations of others. grafisman who had worked for me several years, brought with bim in the spring some scions of I had St Michael pears in abundance, and did not want any more. But sir, said he, these are different from yours. They never blast. They are superior in all respects to any St Michael you ever saw. They are a seedling of this country. A natural fruit of our own land, and command a great tree, and eaten them yourself that makes you so sure of these facts? Certainly, I have, was the answer, and can assure you that what I say is truth. I had heard of a seedling pear raised in Salem, that resembles the St Michael, and is said to be very good. I of course concluded it was this fruit, and I permitted him to insert them into the tree. After waiting three years I got fruit, which proved to be a variety that I had myself introduced into the country 15 years before, and of which I had more than I wanted. Times of ripening depend on climate, and the variety of fruits .-The same thing may be said as to their preserva-

I have extended this article beyond propriety, but there is still much omitted that might be said. You can curtail it as you may deem proper, or omit it altogether if you think it inapplicable to the inquiries of your Bucksport correspondent, A SUBSCRIBER.

FOR THE NEW ENGLAND PARMER.

MR · TIDD'S NEW VARIETIES OF PO-TATOES.

MR EDITOR-As my name has found its way into some of the papers of the day, in relation to raising from the seed a large variety of potatoes, I thought it might not be unacceptable to your readers for me to give a description of the potatoes and my method of raising them. In doing this, I shall endeavor to relate the experiment in as intelligible a manner as possible, in order that if any other person, into whose hands your useful

A year ago, last fall, I collected, principally, I believe from the Early Whites, and the calicoes, a quantity of potato balls, and laid them by, in a room, exposed to all the inclemencies of the season until the next spring, about the last of March or first of April, the exact time not known. When I came to examine them, preparatory to planting, I found them dried so hard, and shrivelled, that I was afraid they were entirely spoiled. I, however, selected some of the best of the balls, and after much labor, in soaking them in warm water, &c, succeeded in extracting a few seeds, and planted them in my green house. The rest of the of the vines, both in the green house and in the balls I kept in water a week or more, without its appearing to have much effect on them. As it house into the garden, I discovered on some of the did not appear to me practicable to separate these seeds from the balls, I began almost to despair of being able to proceed with my experiment to the extent I had proposed. The thought occurred to any. And so it was in the measure in the fall, me that if I separated these balls into small pieces, when I dug them. Some of the largest sized and planted them, some of the seed might possibly vines had no sign of a potatoe on them; but then come up. I resolved to try the experiment, which succeeded beyond my most sanguine expectations. pears which he wished to insert into one of my In every place where I put a piece of one of these trees. I could find no name for them that he balls, the plants came up very thick. In patches the probable crop of potatoes. There were a knew of, but the American St Michael. I told him of, perhaps, a half inch in diameter there were from twenty to fifty plants, so that I soon found notice, a few of which I will name, and attempt that I had abundance of them. As soon as these to describe. plants were well up, and while they were yet in very high flavored-are great bearers, and vastly the seed leaf, I took them up, carefully, and plant-several hundred, all about the size of a pea; ed them out about three inches apart, as I did they hung in clusters, something similar to grapes. also others, which I had previously sowed, after they had gained more strength. I found form, the sweet potatoe. Another bore all the price in the market. Have you seen them on the that they bore transplanting remarkably well, as potatoes on the stem above ground. They were almost every plant lived, and that without any black, and in considerable numbers, and would particular care of shading, &c, though I generally average about half size. They did not hang in chose a cloudy day to transplant them. I found clusters, but were distributed along the main by computation, after I had pricked them out in stem to the distance of about two feet, and bore rows, that I had about two thousand plants, which it, by their weight, down to the ground. In anoccupied about one fourth part of my green house. other the potatoes all grew in one clump, so much I let those plants remain in the green house, till so as to be indented one into the other; and pressall danger of frost was past, or about the middle of May, when I re-transplanted them into a well There did not appear to be any soil to speak of prepared spot in my garden, about 6 by 8 inches between them. In some of the hills, the potatoes apart. Here, I found afterwards I had commit- were all small; in others there were no small ones, ted a great error in planting them too close; for but all middling sized. In others all large, and in the vines by their luxuriant growth soon covered some mixt, large, small, &c. There were some the ground. Notwithstanding they were planted round, some eval, some long, some very smooth, so thick they bore bulbs, and even ripened their shining delicate skins, and some remarkably seeds; and grew as steut and as stocky, as any I rough. I have all colors in all shapes, and am ever saw, even from the long red potatoes; and doubtful if there ever was before so great a vathe yield of some of the plants would cover nearly riety of potatoes seen together. double the space of ground allotted to them. Hilling was entirely out of the question, and some of them were destroyed in attempting to cradicate the weeds, although the operation was performed by a very faithful man, with a strong injunction to be careful. I was led into this error by supposing as I had both read and heard, that the yield, the first year would be very small, not more than two or three potatoes, about as big as a common walnut. This I found by experience, some fair sized potatoes, and a few larger than the average growth of early whites.

The most interesting part to me, and that which ging of them. It is a matter of great interest to paper may fall, should be desirous to repeat the me, to see with what small beginnings, and ap-vines, which bore no potatoes, which died in experiment, they may be able to profit as much parently weak means nature achieves her great de transplanting, or were destroyed in weeding, about

by my errors as by any successful method I may signs. My anticipations in this case were not disappointed. I dug them principally myself, and mostly with my hands, for the double purpose of not injuring, and keeping the potatoes from each plant separate? I found them of all colors from black to white, besides a great number that were variegated, and of all sizes from that of a pea to a full grown potato; and of all forms from a round to a long red, including some handsome ovals; and in all numbers from one to several hundred in a hill, if I may be allowed the term. The greatest yield was from a vine, which produced fifty two, nineteen of which were tolerably fair sized potatoes. There was a great difference in the growth garden. In transplanting them from the green small vines, a few small potatoes about the size of peas, while on those, which were much larger, and looked more thrifty, I could not discover again, some of the largest vines bore the greatest crops of potatoes. I found that the size of the vine was no criterion by which I could judge of good many varieties, which I think worthy of

There was one vine, which had, I should think, Another kind resembled in some measure, in ed into all kinds of shapes, with obtuse edges.

There seems to me to be considerable difficulty. Mr Editor, in regard to what will be the best course for me to pursue, in order to secure the greatest benefit with the least expense, from my experiment. The first question is to know if it is necessary to plant all the potatoes from each plant, in order to obtain all the varieties; or in other words, will all the potatoes, produced from the same vine, the first year from the seed, yield potatoes possessing the same qualities? If I could which is the best schoolnaster, to be a mistake; be well assured that all the potatoes produced for I had, on a considerable number of my vines, from any single seed would yield potatoes possessing precisely the same qualities, then, instead of having twelve or fifteen thousand potatoes to plant, I should not be under the necessity of plant-I had been anticipating all summer, was the dig-ing more than about fifteen hundred; or for fear of accident, say three thousand. I lost in those

five hundred plants, so that I had about fifteen hundred, which bore potatoes. The second them in succession. question is, how far apart they must be planted in order to prevent them from mixing? This I order, and that of the best kind. conceive to be very important; for if they should mix, the potatoes I might select to test the qual- probability of solving it at the time agreed. ity might be entirely different from all the rest in in my next year's crop. And if I must plant farmer's prosperity. them at any considerable distance apart, it will require more ground than I shall be willing to spare.

That potatoes will mix in the ordinary way of planting them I had occular evidence last season, the desk or trunk is a more appropriate place .-My man, who knew that I was something curious in these things, brought me a potato, apparently an early white, with a light red streak, in imitation of the calicoes. He said that it grew among the article is going cheap, unless you have a use whole vegetative effort in producing herbage and early whites, in the vicinity of some calicoes. A for it. row of calicoes ran parallel to, and immediately adjoining the row of whites, from among which their places. this potato was taken. I have preserved it among my seedlings, and intend planting it with them. I had some seedlings marked in precisely the same manner. The third question is, what method shall I adopt to test their quality the next season, should I live to finish the experiment? For, if I have fifteen thousand hills of potatoes, and must try every hill separately, if they are cooked three times a day, it would require thir-have teen years to finish the trial. You see, Mr Editor, sions. into how much difficulty my prying curiosity has involved me; and that it will require much time, man, who will put his own to hazard. trouble and expense to carry on this experiment to completion in the same style in which it was the time, whether your creditor wants it or not .commenced. From the success which has so far attended my weak endeavors, I feel desirous that it should be continued under the best possible auspices. Although I candidly confess that curiinducement at the commencement of the experiment, as I performed all the work, except weeding, with my own hands, yet I will not deny that the honor, the honor, Mr Editor, should I be sucappearances seem to justify me in anticipating, is he will excuse you. not without its influence on my mind. Should I these good qualities unite, yet I hope to have several in which two of them shall predominate in JACOB TIDD. an eminent degree.

Remarks by the Editor .- The above mentioned of importance. experiments of Mr Tipp, appear to us to be of much importance; and we hope his inquiries will elicit the desired information from those who are capable of bestowing it. We propose hereafter to offer some suggestions on the subject.

DR. MITCHELL.

MORTALITY AMONG PEACHES.

I remember the time, nearly forty years ago, when I could boast nearly as many varieties of the peach; I even said I would fatten or feed hogs on the yellow clingstones. There has been since that time a lamentable reverse. The peach trees of that plantation and of the neighboring region have been doomed to linger and perish. The disease has been considered by Mr Prince as contagious, and communicated by morbid flowers; and by Mr Adriance, as caused by a maligu influence shed upon the peach tree by the Lombardy poplar. Other discreet observers have ascribed the mortality to the ravages of the insect Egeria exitiosa, infesting the trunk between air and earth, at the point where the ascending and descending caudex unite. Some again think there is an e, idemic influence, which has not yet reached the end of its destructive term, invading the health and destroying the life of the peach tree. Whether the mortality is owing to either of these causes, or to any other, it is quite a calamity in the region around New York and every place where its visitation extends. The most approved rules against the disorder seem to be these: to raise trees from the seed; to cull out the best varieties of natural growth; to destroy disordered trees and to plant new frequently, say once in five or other term of vears according to circumstances .- Ibid.

REFRIGERATORS.

Concluded from page 236.

When it is required to produce a great degree of cold suddenly, it will be proper to beat the ice small and add about one-fourth its weight of salt; the mixture will melt much sooner than ice alone; and because the freezing point of the brine their union will produce, is 330 below the freezing point of fresh water, and its capacity for heat being greatly increased on its passing to the fluid state, the mixture while melting, must necessarily be abundantly colder than ice; which constant experience verifies. After the brine has taken up so much heat that it is no colder than ice, it may be drawn off and used for cattle or any other necessary purpose. I should suppose this practice would be always proper for fishermen when their fish were first put in.

Before I leave this part of the subject it will not be amiss to notice a very erroneous practice which I am told some have fallen into. Knowing that a mixture of ice and salt produces a great degree of cold, they have very injudiciously mixed salt with the ice when filling their ice houses .-Strange as it may appear, yet it is certainly a fact, that by this practice about three times the quantity of ice will be melted, that would be by using the same weight of boiling water. This, however, is not all clear loss: it has just been observed, that four pounds of ice, or water, and one pound of salt, produce a brine whose freezing point is 380 below the freezing point of fresh water, or 60 below 0: this is the brine that will be produced by a particle of salt coming in contact with ice, at the instant of melting; being about the proportion of salt which water at that temperature can dissolve: therefore, 1 lb. of salt will liquify 4 lbs. of ice in an ice house at the temperature of 320; 1 lb. of boiling water will liquify about 11 lb. But on passing to the liquid state, it takes from the adjoining ice as much heat as supplies its increased capacity; which it is possible, is about 1089; 389 less than fresh water; this being the difference between their freezing points. Admitting the brine to flow off as fast as it is made, these 339 for each pound of brine or one hundred and fifty-two for each pound of salt, is all the loss that will be sustained; because the ice that was cooled by the process, must be again supplied with the same quantity of heat, to raise it to its original temperature: the loss will therefore, be something more than one pound of ice to each pound of salt. If the brine was to continue some time before it passed off from the ice, the loss would be less; because its temperature would be raised by heat taken from the ice; but as certainly as it leaves the ice any colder than the general temperature (320,) so sure some loss is sustained; because the introduction of salt can do very little either towards increasing or diminishing the quantity of heat already in the ice house, or regulating the future supply. Its only agency, goes to effect a speedy dissolution of the ice in contact with it, by borrowing as much heat from the ice in its vicinity, as will supply the increased capacity of the new made liquid, which is about 1080; whereas without salt the same quantity of ice must have taken from the general supply, of heat (the same in both cases) as much as would raise its temperature 1460 before it could be in a condition to flow away. Therefore, admitting it was possible for raised to 320, no advantage can be gained. See- whose productions were examined. Although in many rare and splendid contributions to the stock

ing then it cannot possibly be useful, and may do the variety of articles, these exhibitions may have much harm, applying it in that way must be worse than throwing it away.

After this digression, we will return to the subject of refrigerators. Twenty pounds of ice per day for four mouths is 2400 lbs. a small proportion of the quantity recommended to be stored in the ice house; but we are to remember, that after all precautions, we must expect a great deal more will be melted in the ice house than will be taken out for use. The mean temperature proposed for the inside of the refrigerator and its contents to be kept, (to wit) about 480, and on which the calculation is grounded, is below the point at which the putrefactive process in flesh can commence : fresh ment may therefore be preserved a week, or longer if desired, in good condition, in the hottest weather: and all other kind of provisions, fruits, or liquids will be found to be quite as cold as will be agreeable.

will not be difficult for an ingenious mechanic, to construct refrigerators upon either of the plans proposed, and to vary the form and size at pleasure, always attending to the general rules; that lately introduced by a member among us, and rethe inside vessel must be of metal, and the outside composed of such materials as we find by experience forms the warmest clothing, or are least disposed to conduct heat.

A good method of determining whether any substance is a good, or bad conductor of heat, is, by heating or burning one end of a small piece of late years attracted such general attention among the same material, and holding the other end our countrymen, may be noticed as a prominent in the fingers: if it can be ignited, or burned object of regard among the members of this sociclose to the fingers, without much sensation of heat, it is a bad or slow conductor; if on the contrary, a sensation of heat is perceived when the ignition or burning is at some distance from in perfect maturity and great luxuriance, in the the fingers; it is a good or quick conductor of

Keeping these leading principles in view, refrigerators may be constructed of light materials, to contain, not only butter, but poultry, yeal, lamb, and all sorts of small marketing, which are liable to be injured by carrying in hot weather; one of pect to another article of the highest importance these may be filled, and its contents cooled; then draw off the water and add some more ice; in this condition, it may be put into a covered cart or covered carriage of any kind; may be on the road the whole of a hot summer's day, and be delivered at market in as good condition as in the winter they are persuaded that in flavor and size, the season. This would entirely supersede the necessity of the unhealthy, and disagreeable practice of travelling to market in the night. If such refrige- ries and experiments which have been instituted rators should happen to be made imperfectly, a among the members to ascertain the cause of the blanket or two thrown over them and plenty of late scarcity and difficulty of culture, and to remedry straw around them would be useful.

From the New York Farmer.

REPORT

Of the Inspecting Committee of the New York Horticultural Society, for 1828.

The Committee of Inspection respectfully report, that they have held weekly sessions throughout the past season, for the purpose of receiving such articles as were submitted to their examination. They are gratified in being able to assure the Society that these exhibitions have been uniformly of the most interesting character, and calculated to afford the most satisfactory evidence of

been deficient in comparison with some former seasons, yet in general, the productions inspected have not fallen short in size or other distinguishing excellencies. With few exceptions the specimens have consisted of such horticultural objects as are generally in most demand throughout the country, and which are actually acclimated to our soil or capable of becoming so, and which consequently do not require the aid of artificial cultivation. Several of the most valuable articles of this description, which were almost unknown in our city a few years since, have by means of the skill and efforts of members of this Society, been brought to our market in such quantities and at such prices, as to have become common luxuries to our inhabitants. Among these we might instance the article Brocoli, which is now readily to be obtained in heads averaging from 2 to 4 lbs. for several of the fall and winter mentls, at prices By attending to the foregoing instructions, it little exceeding the ordinary rates of cabbage .-The same thing may be said with regard to the cheapness of cabbage, lettuce, potatoes, and peas, particularly the sort known as Bishop's early pea, markable for its early and abundant produce.

The attention of our members has been also directed successfully to the cultivation of the finer kinds of fruit which the same reference to the sorts most capable of sustaining the vicissitudes of our climate-among these, the Vine, which has of ety. In the course of the season, the committee have examined specimens of several different kinds of foreign grapes which have produced fruit open grounds of our city and its vicinity. From this fact the committee entertain a well grounded hope that the obstacles which our climate presents to the cultivation of this delicious fruit will ultimately be overcome.

The committee have further to report with resto the horticulturist, the Peach, that they are led to anticipate a return of the former abundance of this unrivalled fruit. From the specimens which they have inspected, which were produced in the open grounds and gardens in and near the city, peach has in no wise degenerated from its former excellence, and they are persuaded that the inquidy the evil, will be crowned with success.

The exhibition of apples, pears, and plums, have alse been of the most interesting description.-Several new and valuable varieties imported by members of the Society, have produced fruit which premise to become important additions to our already extensive catalogue of these species.

With respect to the interesting department of our science, Floriculture, abundant testimony of the increasing attention paid it, has been presented to the committee. During the whole course of the season, the exhibitions of this branch of horticulture have been uncommonly rich and the contributors numerous. The correspondence which several of our members maintain with the best the brine to be retained until its temperature was the skill and success of the several members gardeners of Europe, has enabled them to add

of our cultivated flowers-at the same time that the many beautiful specimens of native plants which have been brought to their notice subjected to cultivation in several of the gardens of our members, is a gratifying proof that the rich mine of our indigenous flora has not been neglected.

On reviewing the proceedings of the past season of exhibition, the committee perceive abundant cause of congratulation to the Society. The members are advancing with vigor, harmony, and success, in promoting the objects of the institution; and the influence which their labors must exert in the community, cannot fail to have the most salutary effects in eliciting improvements in horticultural science generally.

The following is the list of members to whom the premiums are due for the several articles exhibited before the committee, viz:

Best Hyacinths. E. H. Warner, Early Potatoes. Daniel Phelan, Early Cucumbers. Early Peas. John Curr, Carrots and Beets. 44 ** Lima Beans. " Brocoli. Largest Cauliflower. D. Phelan, T. Kinnersley, Early Cabbage. Wm. Curr, Largest Lettuce. Best Celery. 44 Michl. Flov, Knight's Marrow Peas. Cichery. George Still, Late Carrots. Ingle Ficke, Savoys. Francis Cooper, Strawherries. Gooseherries. Wm. Neale, Apricots. E. H. Warner, Alex. Smith, Peaches. Pears and Plums. " Wm. Wilson, Muskmelons. Grapes. Alex. Smith, Best Carnations.

They recommend that a discretionary premium be awarded to the following gentlemen, for articles not specified as subjects of competition:

Wm. Phelan,

Mr Andrew Parmentier, for the great variety of grapes cultivated by him; Mr Peter Aymer, for fine quinces; Mr Floy, for raising 5 new sorts of seedling Camellia japonica; Mr D. Phelan for new seedling Geraniums.

Messrs Hogg, Wilson, Prince, Saltus, Thorne, and Mrs Griffith, for the number and variety of choice and rare plants exhibited.

by the Society, for the year 1829:

FLOWERS.

fixed by the Inspecting Committee.

VEGETABLES.

Cucumbers, Peas,	Best pair, earliest forced. " I quart last Tuesday in May.
Cabbage,	" 4 heads, do do.
Potatoes,	" half peck, do do
Beets,	" 6 roots, second Tues- day in June.
Carrots,	" 6 roots do do

Pears,	« do
Nectarines,	" half dozen,
Apricots,	« dozen.
Grapes,	" 2 bunches
Strawberries,	" quart.
Muskmelons,	" prir.
Gooseberries.	« dozen.

For a native hardy grape to give a good wine. For the best seedling apple for making cider, the specific gravity of which must exceed 1,000; also for table use.

The day for exhibition to be fixed by the Inspecting Committee and published.

Discretionary premiums will be awarded for flowers, vegetables, or fruit, presented by members, or others, when rare and of excellent sorts.

FRANCIS COOPER, Chairman. New York, Jan. 27, 1829.

Mode of growing Early Potatoes in the North of Luncashire .- Put the potatoes in a room, or other convenient warm place; about the 2d of February, cover them with a woollen cloth for about 4 weeks, then take it off, and by so doing you will make the sprouts much stronger. Towards the latter end of March, set them, covering the sprouts about two inches deep. If the spronts be about two inches long when set, the potatoes will be ready in 7 or 8 weeks afterwards. A gentleman who had a green-house, adopted the following plan: He placed the potatoes in the green-house in turf mould or peat earth, in the beginning of February, and kept them well moistened with water; he planted them in the open air about the end of March, on a warm border, leaving about half an inch of the points of the sprouts above the ground, and protected them during nights by coverings of mats. By this plan he was able to have new potatoes about the beginning of May. It is considered a very material thing to get the potatoes well sprouted before they are planted.

ALBANY HORTICULTURAL SOCIETY. The Albany Horticultural Society met agreea-

Premiums for the following articles are offered bly to adjournment, on Thursday evening, the 15th inst. Hon. Alfred Conkling from the Committee appointed for that purpose, reported a constitution and by-laws for the improvement of the Polyanthus, Auriculas, Carnations, Pinks, Tu- society, which after slight modification, were lips, Hyacinths. The days of exhibition to be adopted. The following officers were then elect-

> JESSE BUEL, President. Alfred Conkling, 1st Vice-President. Tennis Van Vechten, 2d do. Edward C. Delavan, 3d do. Douw B. Slingerland, Treasurer. Lewis C. Beck, Corresponding Secretary. John Ogden Day, Recording

Council .- John N. Quackenbush, John L. Winne, John I. Godfrey, Richard M. Meigs, Andrew Kirk, Caleb N. Bement, Isaae Denniston, John Bryan, James Wilson, Henry A. Fay, George Wilcox, Paul Clark, Edward Dunn, T. R. Beck, and Henry W. Snyder.

The constitution provides for four stated meetinga annually, on the first Tuesdays of December, March, June, and September, the last of which is to be the anniversary meeting for the choice of officers, &c. There will, besides, be other meetings of the council, or of an examining committee, to inspect esculents, flowers, and plants presented for competition or comparison. The members are required to pay two dollars per annum. All subscriptions and donations, (unless otherwise directed by the donor,) are to go into a permanent fund, which cannot be impaired until the principal amounts to five thousand dollars. The interest of this fund, and two dollars annually paid by each member, will be applied, it is understood, in premiums, in the purchase of horticultural works, and in defraying incidental expenses.

An experiment of a few years will test the utility of this association, and afford data to determine on the propriety of extending its views to the establishment of a Botanic Garden -an ulterior object not only desirable for its intrinsic usefulness, but for the interesting attractions it would present to the citizen and stranger.

It is gratifying to state that the advantages which promise to grow out of this association, appear to be duly appreciated by our citizens, nearly one hundred of whom have sanctioned it with their names; and we indulge the hope that the number will be considerably augmented .- Ilbany

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 20, 1829.

RAILWAYS .- No. IV. (By the Editor.) (Concluded from page 234.)

A railway is neither more nor less than that sort of road, or highway, which the calculations of science, and the results of extensive practice have proved to be the best, cheapest, and most convenient of all roads, on which a great deal of travel exists, or is likely to take place, A railway, leading from a scaport, or other great commercial. place, into and through a fertile surrounding or back country has the effect, in a degree, of annihilating much of the distance between country and city. It increases the value of real estate, in the country, by the amount of the value of the facilities it gives to travel and transport. It enhances the value of real property in the city by the same ratio. Those farmers who cultivate lands near the city, and to whom the railway affords no direct accommodation will still be benefited indirectly; for " whatever tends to increase the population, business, and wealth of the metropolis is advantageous to the neighboring coun-

Before railways were invented or much known, turnpike roads were the best highways, of which mankind, in general, possessed any information. Although their utility is now generally appreciated, they were, at their first introduction, opposed as violently, and with as much ignorant pertinacity as railways are at the present period. Means correctly calculated to benefit farmers, by affording them smooth roads leading to market were decried and depreciated as inimical to freedom, and tending to make lords of our rulers and slaves of the great mass of the population. A turnpike presented a highway to despotism; and a toll gath-

^{*} Report of Directors on the Boston and Albany Rad Road

erer was one of the minions of an overbearing, all-grasping aristocracy. In those days a journey of a hundred miles, from Connecticut river to the town of Boston was considered as an enterprise requiring a great deal of deliberation, a long time for preparation, and a very serious draught on the distance from Connecticut river to Boston is diminished from three days' to one day's journey.

be easy to prove that the best in the United States do not present greater improvements on the roads existing immediately previous to their formation than well constructed railways would afford when compared with such turnpikes. To prove this we turnpikes afford with those which railways present. It is stated by competent judges, conversant with subjects of this nature, that on turn- at present constructed over turnpikes. pikes, as they are usually constructed in the than 14 cwt, each, the weight of the wagon inclusive. The wagon or other vehicle intended and proper for a turnpike must be much heavier railway. We believe, therefore, that 10 cwt. for each horse, exclusive of the weight of the carriage mated to be equivalent to that required for moving 10 tons on a level rail road, including also all inclinations not exceeding 26 feet in a mile. This estimate supposes 2240 lbs, to the ton. If we exclude a quarter for the weight of carriages, there will remain 16,800 lbs. for the load. For greater safety in the calculation we will suppose the load for a single horse, exclusive of wagons, to be 16,000 lbs. or 8 tons, by the statute of this Comdriver would be sufficient to conduct several car- the velocity of lightning add an approximation to riages conveying 16 tons on all the level and des- the power of an earthquake. cending parts of the road, and also on the parts On the portions ascending above 26 feet in a mile, horses will be required, except where the excess is slight and for short distances. In a temporary exertion, such as horses travelling with heavy loads, on common roads, are always required to make in passing hills, the power of the two horses would be competent to draw the sixteen tons over ascents of 40 or 50 feet to a mile. But to save the strength of the horses, and to maintain a convenient rate of speed, it would be expedient to provide additional horses, at least on all the portions of any considerable extent, where the inclination exceeds 26 or 30 feet. On the parts of the road inclining from 26 to 52 feet, measuring 39 miles between Boston and Albany, one additional horse would be sufficient. On the inclinations from 52 to 80 feet, two additional horses, or double the number required on the level parts of the road would be necessary. The sections which have this inclination between Boston and the New York line, measure 431 miles, and for the remaining portion of the road, from the State line to Albany nearly 81 miles must be added, making 52 miles." It appears from the above and other data, which may be drawn from the "Report,"

that in order to transport 16 tons from Boston to of our current volume, may be done to advantage. Albany, 28 horses, employed one day each, equivalent to 28 days' work of a single horse, is all the horse-lahor required. Now on a turnpike of 198 be had, and such details of the process as may be miles it would require to convey 16 tons 32 horses, which travelling at the rate of thirty noles a day current coin of the village. Turnpikes, however, would be seven days nearly in traversing the became almost as common, and in a degree as whole distance. There would then be needed beneficial as sunshine; and, in consequence, the horse labor equal to 7×32 or 224 days' work of a single horse. Therefore, the advantage in favor of the railway compared with a turnpike over the Beneficial as turnpikes are, we believe it would ground surveyed from Boston to Albany, in the articles of horse-lahor alone would be as 28 to 224; or precisely 8 to 1 in favor of the railway. In other words one horse would transport as much on the railway as 8 horses on the turnpike. Besides all this 16 tons on a tumpike would require will compare the facilities for transportation which for their transports at least 8 teams and 8 men to conduct them; but further details are not necessary to prove the great superiority of railways as

Another argument in favor of railways may be United States, our horses can rarely draw more found in the facilities, which they present for still further improvements in transport and travel .-They open an extensive arena for the display of those powers of invention for which our countryand stronger, in proportion to the load, which it is men are so highly distinguished. The man who calculated to carry, than the car constructed for a first employed steam for mechanical purposes could have no adequate idea of the extent and richness of the field he had entered; and so with is a full load on the common turnpikes of the railways, simple as their invention may seem, it af-United States. On a rail road "the power of fords facilities for supplying the wants of mankind, the lower end turned so that it may be kitched and enlarging the empire of mind over matter to an extent beyond the ken of human prescience .-Friction in railway carriages, will, probably, be almost annihilated, and steam, gas, or vapor engines may give them a rapidity of motion which no man's philosophy has hitherto dreamed of. The the steam from the boilers goes into the smoke railway presents a road which knows few impediments; steam and the other agents before mentioned offer us strength which can acknowledge no limits. Man may, hereafter, harness the clemonwealth. Two horses, therefore, with a single ments to his rail road car, and to something like should be always closed when the stove is in use;

The railway has its opponents, and every other ascending at a rate not exceeding 26 feet in a mile. improvement from the plough to the steam engine has also been opposed. If rain and sunshine deif stationary powers are not provided, additional pended on human volition, there are those who would limit them to their own farms, or at farthest cessary to burn a stick of wood, excepting a sufto the immediate vicinity of Boston. They argue somewhat after this sort. If the common bounties of heaven, to which we are indehted for seed time and harvest, could be confined to n circle whose centre should be Boston State house, and radius extend but 8 or 10 miles into the country, it would so far diminish the present glut of country produce in Boston market, that we gentlemen cultivators might command as high a price for our provisions as was given in olden time when Senacherib laid siege to Samaria.

llops imported from Van Dieman's Land are of so superior quality as to have sold for 8 shillings a

The quantity of flour inspected in Albany in 1828, was 39,450 barrels, being a decrease from 1827, of nearly 14,000 barrels. Fees \$789.

Use of Sand in propagating Trees, Shrubs, &c .-A friend who is a practical and scientific horticulturist, wishes for further information relative to propagating trees, shrubs, &c. by the use of sand, which, according to an article, published page 202 bank side; into which the rain from your roofs

The gentleman would be obliged by a statement of the kind and quality of the sand, where it may requisite to insure its success.

[The following is a valuable paper.—Ep.] FOR THE NEW ENGLAND FARMER.

DOMESTIC ECONOMY.

MR FESSENDEN-This is the second year since I became a subscriber to your valuable paper, which I have read with great interest, and have received through your columns from my fellow subscribers and yourself a great deal of useful information, but as yet have not thrown my mite into the common stock.

So barren sands imbibe the showers, But render neither fruit nor flowers-Unpleasant and ungrateful.

I shall attempt to give a brief description of a mode of constructing a common parlor and kitchen, which I have partly adopted with complete success: in all situations, where the ground will admit, I would have a cellar kitchen, about half the story below ground. The fireplace should be of sufficient size to contain several clay furnaces, that the smoke and steam from them may ascend the chimney. The chimney should have a valve of iron in its throat which may be opened or shut by means of a rod passing down the chimney; over a nail. By this valve you can regulate the draft of the chimney, as well as extinguish the flames, if your chimney be on fire. In the winter, I would use a cooking stove of the best construction, with a steam as well as smoke pipe; for if pipe, it will make it foul much sooner. Let these pipes pass into a drum made either plain or ornamental as best suits the owner. From the drum conduct it into the chimney above the valve, which for no stove will draw as well if the pipe enters a large chimney open at the bottom.

The drum should be pretty large and placed in the common parlor immediately above the kitchen: if the drum be large the room will be sufficiently warm in the coldest weather without it being neficiency in the stove below for warming the kitchen. This is not only an economical but also a safe way of warming a common parlor. The mistress may leave the room without being apprehensive of the fire falling or snapping out on the floor, or the children falling in it and getting burned : and if she goes from home, while there is a fire in the kitchen, she has always a warm parlor to re-

There are other advantages in a kitchen thus constructed, which it is unnecessary here to enumerate. Adjoining the end of the house next the kitchen I would have a shed which should cover the well, and he sufficiently large for a kitchen in summer, (if preferred) and a wood house in winter. Under the floor of the shed I would have a box or cistern, that would contain water enough to last 24 hours. This may be pumped or drawn full once a day and drawn out through a pipe or leader into the cellar kitchen as wanted. If your building site is on the declivity of a hill, you may make a cheap cistern of lime and gravel on the

may be conducted, and drawn out by a tube inserted into the bottom of the cistern, and leading into your kitchen. If things are rightly considered. I believe it will be found that a cellar kitchen is more convenient than one above ground, and much more economical. I conclude by saying if you believe this worth a place in your Farmer, you are welcome to it-if it is deemed otherwise I shall not be offended -but have the satisfaction of having done a part of my duty.

JAMES S. LAWRENCE.

Hickory Grove, Monmouth ? Co. N. J. Jan. 3, 1829.

Extraordinary Fruit.—We have just been shown a lemon of uncommon size, raised on Mr S. M'Cutchon's plantation at New Orleans. measured 14 inches in circumference taken between the stem and the opposite end of the fruit, and 141 when measured lengthwise. About 20 others of the same size, produced on the same tree, were sent to this city .- N. Y. Evc. Post.

Useful Inventions .- Mr John W. Cooper, of Waynesburg, in Franklin county, Pennsylvania, has discovered (for which he has obtained patents) a new mode of bleaching and whitening of flax, hemp, tow, and cotton cloth, in the course of a few hours, without the least injury or damage to the strength thereof-and also, of making white paper from rags of cotton, linen or silk, be their colour ever so various, and of extracting from all kinds of rags, all kinds of mineral colors, and rendering them white and completely bleached, &c. The ingredients and process used, are said to be so cheap and trifling as to render these discoveries highly valuable, particularly to paper makers.

HORTICULTURAL SOCIETY.

Those gentlemen in this city and the vicinity, favorably disposed toward the institution of such a Society, are requested to meet at the office of ZEBEDEE Cook, Jr. 71 Congress street, on Tuesday next, (the 24th current,) at 12 o'clock at noon, for the purpose of adopting measures preliminary thereto.

INFORMATION WANTED

Of the imported Stud Horse Columbus, which was sold a year or more since by the Mass. Agricultural Society. The owner may hear of something to his advantage, by sending his address, (post paid) at the New England Farmer office.

The Report of the Committee of the Essex Agricultural Society appointed to view the Farms, entered for premiums, has been received, and shall appear in our next.

Pressed Culinary Herbs.

For sale at the New England Farmer Seed Store, No. 52, North Market street, Culinary Herbs, dried, pressed, and neatly packed, in parcels, at the following prices: —Sweet Marjoram, 30 cts—Summer Savory, 25 cts—Thyme, 33 cts—Sage, 17 cts—Celery, (in bottles for soups, &c.) 25 cts—Balm, 33 cts—cptf

Tavern to be Leased.

To be leased, that excellent stand for country custom, the Tavern on the Mill Dam or Western Avenue, now occupied by Major Horatio G. Buttrick. It is believed that an active and Major Horauo C., Duttiers. At is Defleved that an active and enterprising man might acquire a fortune by hiring it. Terms, five years lease, with good security—rent 500 dollars. If not leased before the 2d day of March next, it will be let at public auction on that day, at 12 celock, M. on the premises. Inquire of JOHN LOWELL, Common Street, Boston.

SEEDS WHOLESALE AND RETAIL

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of seeds to be found in New England-of the crops of 1828. The greatest care has been taken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. They are offered for sale by the bushel, pound, or paper, on favorable terms. Each package for retail is accompanied with short directions on its manage-ment. The following comprise some of our most prominent sorts. Pamphlet catalogues gratis.

MISCELLANIES.

FOR THE NEW ENGLAND PARMER.

A celebrated Scythian Philosopher, being asked how it was possible a person might contract a dislike to wine, answered. " By beholding the indecrucies of the drankard."

On entering a house a few evenings since, I found a lad of 15, diverting himself in writing poetry. I requested him by way of trial, however, to make a few lines on intemperance. He in stantly set about it, and soon handed me the following portrait. VERITAS.

> The evil of evils that prevails, O'er New England's hills and dales; The scourge and curse of this our land, Is not the warrior's vengetul hand: But what is worse, yes, worse by far, Than all the noise and rage of war, Is ardent spirit and strong drinks, That poisons our whole frame, and sinks The noblest work that God has made, Below the beasts that range the mead. Oh, see the drunkard take the cop, Oh, see him drink the liquor up: Oh, see hun trying to go home, But cannot for the cause is rum, Oh, see him tott'ring, stagg'ring round, At last be falls unto the ground; And then he tries but tries in vain. His former posture to regain; And after trying all he could, He does as every drunkard should; He takes a nap and sleeps it out. And then gets up and walks about, Now let us look into his cot, Still there we see a drunken sot : But some to pity, there we see, A wife, and children two or three; His children are all clothed in rags, His wife, a life of slavery drags, She thinks in silent, domb despair. On prospects that surround her there. To make his ruin quite complete, He finds himself involved in debt; And then the law for want of bail, Confines him in some neighb'ring jail. Now to all drunkards I would say, It they would keep from jails away, You must the poison never drink, And not so much as on it think: For Chambers' nauscons drug is vain, Y. or sottish thirsting to restrain; Unless you make a resolution, Never again to taste the poison.

FOR THE NEW ENGLAND FARMER.

Dress .- He who has no other way to distinguish himself than by the fashion and materials of his dress, is a despirable creature; and unites the silliness of the goose with the pride of the peacock.

Variety of opinions .- As we never see two faces exactly like each other, we need not expect to find exact similarity of opinions; and we may as well quarrel with a man for his form and features as on account of the articles of his creed.

" For modes of faith let senseless bigots fight, His can't be wrong, whose life is in the right,"

Mental Enjoyments .- By reading we enjoy the company of the dead, by conversation that of the living, and by contemplation we may be happy in ourselves.

FORCE OF IMAGINATION.

Mr Elijah Barnes of Pennsylvania, some years since, while at work in the held, killed a rattle-

snake, and immediately after had occasion to return to his house, and took through mistake his son's waistcoat and put it on. His son was but a youth, and the waistcoats of both father and son were made from the same piece of cloth. The weather being warm, the old gentleman did not attempt to button his waistcoat until he had arrived and seated himself in his house; when to his astonishment he found it much too small. Imagination now took wings, and he instantly conceived the idea, that he had been bitten, imperceptibly, by the snake, and was thus swollen from its poison. He grew suddenly ill and took his bed. The family, in confusion, as not a minute was to he lost, sent a messenger, post-haste, for three physicians. The first that arrived poured down oil, the second drenched him with the juice of plantain, and the third gave him freely the decoction of hearhound. But, notwithstanding all these medicines, the patient grew worse and worse, every minute, until, at length, his son came home with his father's waistcoat dangling about him. The mystery was instantly unfolded, and notwithstanding the oil, plantain, and hoarhound, the patient was immediately restored to health; except a load on the stomach, and his frightful imaginations and apprehensions vanished, "like the baseless fabric of a vision,"

The king of Siam, who had never seen or heard of such a thing as frost, when told by the Dutch Ambassador, that in his country, water would sometimes, in cold weather, he so hard that men might walk on it, replied, "Hitherto I have believed the strange things you have told me, because I looked upon you as an honest man, but now I am sure you are a liar."

So it is with many farmers of the old stamp .-They will not believe in any improvement, and spurn at every attempt towards it.

WICKEDNESS OF ABUSING A HORSE. By Rev. Mr Pierpont.

The sins which we commit, my children, against the brute creatures of God, when we subject them to unnecessary suffering, are sins against God their Creator. Shall we believe according to the declaration of his holy word, that a righteous man regardeth the life of his beast, and not believe that a righteous God will regard it? He heareth the raven cry; and shall he not hear, and will he not avenge the wrongs that cry out against man from youth to age, in the city and the field, by the way and by the fireside?

Look out into the street. See that cartman! What has thrown him into such a passion? The street echoes with the crack of his whip. His horse stung almost to madness, springs forward to clear himself from his confinement—to disengage himself from his cruel thraldom. He is met by a blow with the loaded end of the driver's whip.

Whence comes this dreadful struggle between that manly spirit of a brute and that brutal spirit of a man? Whence comes it? The man has loaded the horse beyond his strength. Every ounce of the generous creature's weight has been thrown forward again and again, but in vain; and now comes the reproach, and now the lash, and the curse, and the staggering blow:

Righteons God! who gavest that neb'e animal his strength, and his spirit, is that monster, that is thus beating him, a man? the man whom then

kindled the fire in the horse's glorious eye, 'clothed his neck with thunder,' and has made him to mock at fear, and to turn not away from the sword, that he might help man to maintain his rights, and defend a righteous case, -it is to such a creature as this, that thou hast made him to be in subjection?

But, perhaps, the man in form is no longer a man. He has thrown away the only thing that had raised him above the brute. He has drowned his reason in a cup. He is drunk, and his generous horse must suffer! How much nobler is the brute that is beaten, than the brute that beats

'Stop, degraded wretch! you shall not thus abuse your horse !'- But hark! he replies :- 'It is my horse, and have I not a right to do what I will with my own?' I answer :- It may be your horse, but he is yours for use, not for abuse.' I answer again :- You have not a right to do a wrong either with what is your own, or with what is not.' The Maker of this horse is your Maker also, and your Judge. He sees the suffering which you inflict upon the faithful and defenceless subject of your power; and although he has sealed up the dumb creature's lips, so that he cannot plead for himself against you, yet what he meekly and patiently suffers from your cruelty will plead for him, and if more mercy is not shown to you, than you show to your beast, it will bring down upon you the righteous judgment of the

Farmer Wanted.

A faithful man is wanted to take charge of a small place in Roxbury, comprising a garden, orchard, &c.

IF It must be expressly understood that no ardent spirits will be allowed on the place. Persons who are unwilling to accede to this, need not make application to the New England Farmer Seed Store, 52 North Market St. Boston.

Farmer Wanted.

Wanted, an active, industrious man (a Scotchman will be preferred) to take the charge and assist in laboring on a farm. To a person properly qualified, a fair compensation, punctual pay, and employment for several years will be given.

The An entire abstinence from the use of ardent spirits, will required. Apply to Geo. Bacon, at Thompson's Hotel, No. 9 Elm street. Feb 6

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

that duty, and submit the following

REPORT.

The whole number of Farms entered for premiums were six, to wit., the farms of JACOB OSGOOD, and DAVID GRAY, in Andover ; -of DANIEL PUT-NAM, in Danvers ;-of JAMES PECKER, in Amesbury ;-of WILLIAM THURLOW, and the Indian Hill Farm, in West Newbury. These were severally examined by the Committee in June and September ;- a particular description of them, together with an account of their productions the present year, will be found in the statements of the several claimants annexed to this Report.

Mr Osgoop's farm is situate in the West Parish of Andover, and contains about one hundred and fifty acres, besides his woodlands. The land is level, and naturally cold and unproductive. The present proprietor has had the entire management of the farm, for the last forty years or more; and its present appearance is a most striking illustration of how much may be offected by the persevering industry of man, where Nature has bestowed her gifts but sparingly. By a judicious divis-exclusive of woodland. The natural condition of this species of grain. ion of the land into lots, and by unremitted attention to the collecting and making of manure, Mr laid by his own hands ;-the rocks to make which were all brought the distance of half a mile or more. Mr Oscood uses his fields alternately for cultivation or pasturage, thus giving to them all in. their turn, the benefits to be derived from ploughing and manure. By this means no part of his lands run to waste ;- and no part of them is infested with noxious weeds, or troublesome briars bad husbandry to have foothold, even upon the borders of his lands.

One of the most prominent improvements seen upon this farm, is in the reclaiming of cold unproductive wet meadows. More than thirty years since Mr Oscood commenced the draining of this kind of land, and carrying the sand from their borders upon the surface: This was done in the winter season when the ground was frozen, and when the other parts of the farm did not demand his labor. In this way, many acres of his best mowing lands, situate near his barns, now produeing annually two or three tons of good fodder to the acre, have been made, where nothing valuable grew before ;-even where it was not safe for man to tread, unless the ground were frozen,

is to be found in his cellar-here is eider from one | good management, and displayed many points to to nine years old, clear as Madeira, and but little merit our approbation. inferior, and this without the aid of ardent spirit or other foreign ingredient. Under the skilful be subdued. Within a few years, Mr Putnam management of Mr Pecker a few acres are made has converted some of his roughest pastures into to yield as much as many large farms; and with very productive mowing lands ;-he has also made much less expense of labor. Your Committee successful experiments' in the reclaiming of wet were much pleased with their view of this place;

The Indian Hill Farm in West Newbury, under making and preserving of manure. By these the care of Mr William J. Greive, was visited means alone the produce has been more than by your Committee. They regret not being furfor fear of sinking in a quagmire. Mr Oscoon has doubled within the last twelve years. We have nished with an account of its products the present been equally fortunate in his cultivation of fruit, rarely it ever seen this part of the farmer's duty year. They were much gratified, with the many as in his other improvements. His orchard is better attended to than by Mr Putnam. Consid- indications of industry and effective labor displayscattered in all parts of his farm—it having been cring the quantity of labor bestowed upon this ed on this farm. Numerous experiments have his policy to place trees where he thought they farm, and the divided attention it received from its been commenced, that will require more than one would grow, rather than to have them look pretty proprietor, in consequence of other more advan- season to test their merits; and your Committee in a row. But the best part of his orchard policy tageous employments, it gave many indications of sincercly hope that the result will prove, that the

farmers of Essex will find their benefit, in adopting the improvements that have been introduced upon this farm. But while it remains uncertain, whether the innovations that have been here introduced upon Yankee husbandry, are not experiments made for the purpose of display, unmindful of the costs, rather than experiments that will remunerate themselves,-your committee feel it to be their duty to hesitate in approving of the same. Believing, at all times, that that species of farming alone is to be encouraged by this society, which will ensure its own reward, and support itself .-Gentlemen, with fortunes, may amuse themselves with farms, as well as with dogs or horses, or in any other manner; but such amusements belong not to our yeomanry, who have to earn their bread by the sweat of their brow, and whose muscles, strengthened by toil, are the surest pledge of perpetuity to our civil institutions.

In the notice we have taken of the farms that come within our observation, it was not our purpose to compare them with other farms in the county that were not entered for premium. Your committee are well aware that there are many other farms in each of the towns mentioned in this report, that if they had been entered for premium, would have had a fair chance in the competition. Their first inquiry was, have the present claimants so managed their farms, as to merit the approbation of this society, and to afford fair examples to their neighbors for imitation? On this point, your committée were manimous in the opinion in favor of the Claimants. Accordingly, they think it proper that the premiums offered, should be awarded. And they would recommend that they be awarded in the following order, to wit:-

To JACOB OSGOOD, of Andover, 1st prem. \$35. " WILLIAM THURLOW, of W. Newbury,

2d prem.

" DAVID GRAY, of Andover, 3d prem.

" DANIEL PUTNAM, of Danvers, 4th prem. " JAMES PECKER, of Amesbury, 5th prem.

FOR THE NEW ENGLAND FARMER.

HORTICULTURAL SOCIETY.

We are pleased to learn that the meeting of the friends of horticulture in this city on Tuesday last, afforded the most conclusive evidence, that a society for the improvement of this branch of our domestic industry, will be established under auspicious circumstances.

For ourselves we have long felt a strong interest in this matter. We have seen in other sections of our country, the beneficial influence of institutions devoted to the practice of horticultural pursuits, and heard more, of its ameliorating effects upon the varieties of fruits, heretofore cultivated with partial success.

The association of men of taste, of influence, and of industry, has effected in some of our neighboring cities, a wonderful improvement in the qualof successful culture in our climate. Here, individ- and impeded in its downward progress; the con-

ual efforts have generously, and patriotically contributed to collect the finest varieties of fruits, and not only to distribute gratuitously the plants, or the scions, as the case may be, for extended culture; but what renders the favor more valuable, to impart from their rich stores of practical knowledge, a portion for the benefit of the uninitiated.

We love the pursuits of horticulture net only for the instruction it affords to man of the subserviency of nature to his will, and his industry. We regard it as a peaceful and laudable source of enjoyment .- And to him who can look through nature, up to its great first Cause, it is a rich and illumined page, wherein he may read inscribed the promise, that "though like autumn's fruits and flowers mankind will fade from off the earth, yet like them his root will not die in the ground, but rise again and shed the benign influence of a useful life, in gardens of unfading beauty, and enduring loveliness."

That mind that is not expanded, and that heart that is not warmed in the contemplation of the fruitful and ornamented garden, must be cold and inanimate. And if " he who has not music in his soul is" adjudged "fit for treason;" he that has not felt the glow of gratitude in contemplating the objects which bountiful nature presents, is not to be envied. For ourselves we are free to declare that the most peaceful and gratified moments of our life have been passed in the pursuits of horticulture. In a manner relieved from the labor and occupations of business, we have found, with a slight variation from the poet's text-

exempt from public haunt -tongues in trees, books in the running brooks, Sermons in flowers, and good in everything.

The benefits derived from an improved state of horticulture are of unlimited extent. They are confined to no class, all may enjoy them. Health is promoted by the labor, and ease and contentment follow on success. DORCHESTER.

ON THE CULTIVATION OF BEETS. By the Editor of the Southern Agriculturist.

There are many varieties of this vegetable, such as the large-rooted, the long-rooted, dwarf, turniprooted, small red Castlenandari, green-topped, vellow-rooted, &c. We will confine our remarks to those sold by our seedsmen, as the long-blood and turnip-rooted beets, as these are the only varieties cultivated among us, and as far as we have been able to ascertain, they are to be preferred to any of those enumerated above. The Castlenandari is said to be much esteemed in France, and to have the taste of a nut: we have not, as yet, was numerously attended; and that the occasion been able to obtain the seed. We have at different periods cultivated most of those enumerated above, and prefer the turnip-rooted, on account of its superior delicacy, earliness, and the greater ease with which it can be raised.

A light, deep and rich soil is the best suited for the culture of the beet; they should be sown if possible on ground which has been highly manured for some other crop, but should there be none of this description vacant, well rotted manure may be used, and even fresh, in case of necessity, if proper care be taken that the whole be turned under, and not mixed through the upper soil. The ob-

sequence is, that instead of one long, large, straight and clean root, we often, under such circumstances, have many small ones, and numerous fibres, rendering it unfit for the table. The remedy for this is obvious, and it is rather surprising, that the cause of the forking of the roots being known, the remedy should not have been applied. It is simply to place the manure at such a depth, that the root may not reach it, and consequently not be diverted until it shall have grown to a proper length. This may be effected by spreading the manure on the surface and with a spade turning it entirely under, completely reversing the soil, so as to place that which was on top together with the manure, at the bottom-care is required in this operation, that all of the manure be completely buried, and that none by the carelessness of the gardener, be intermingled with the upper soil. Another method (and it is one which we have adopted for many years with considerable success,) is, after the ground is prepared, to make small trenches or furrows, either with a spade, or, if there be ground enough, with the plough, and at the bettem of these to scatter the manure, level the surface, or raise it into ridglets over the manure and plant on these. This last will be found most effectual, and for many reasons the best. By pursuing this plan fresh manure may be used, though we would always prefer that which is partially rotted. In preparing the ground for a crop, care should be taken to have it well broken up, and made mellow as deep as possible; the beet sends its root to a great depth in search of food, and it ought not to be impeded by meeting with a hard and compact soil. If possible let it be stirred eighteen inches deep, for it will generally be found that all other circumstances being equal, that compartment which has been stirred the deepest, will produce the best crop. The spade is decidedly the best instrument for stirring the ground, but where a large quantity is to be raised, the plough may be used, and more especially if the ridge system be adopted. The usual method is, to have the ground, after being thus prepared, laid off into four feet beds-to plant two or three seeds every nine inches, in rows a foot apart, these to be thinned out to single plants when about the size of a goose-quill. Such as are thinned out may be transplanted to fill up the vacancies which may occur in the beds. (To be continued.)

Flax and Linen Manufacturers .- The demand for flax created by the establishment of our enterprising citizen, John Towne, it is hoped, will excite the attention and stimulate the exertions of the farmers in the neighborhood, to the cultivation and improvement of that interesting and important staple production of our country. The machinery for spinning flax by steam power, is now in complete operation under the superintendance of Mr William Sutliff, to whose mechanical genius and industry, we are indebted (through Mr Towne's patronage and capital,) for this important branch of manufactures, so long a desideratum in this and other countries .- The articles manufactured, viz: Drilling, table cloths, linen, &c, are of a superior quality. The damask table linen, noticed in a late number of the Statesman, as manufactured by Mr jection to using manure, more especially in a fresh Hamilton Steuart, were made of cotton and linen, state, with this or any other long-rected crop, is, and weve by Mr Thomas Brown, an ingenious ities of indigenous fruits, and a great increase of that meeting with it in lumps and detached par- workman from near Edinburgh. Mr Towne's the varieties of foreign, of every kind, susceptible cels, the root is diverted from its proper course establishment will soon afford materials for the

ring bacon in Virginia, laid down by a gentleman of the Isle of Wight county, who has had much experience in the process. - Lancaster Journal.

"To have good bacon, the pork must be fat. It may possibly be too fat, though that is very rarely the case in Virginia. Hogs about eighteen months old, which are raised poor, and afterwards well fatted in a short time on corn, are, I think, decidedly to be preferred. Before the pork be salted up, it should be thoroughly cold, a circumstance indispensable to its lasting preservation; and it is at least the safest course in our uncertain climate, to lose no time afterwards. To give bacon its most exquisite flavor, both molasses or sugar, and salt-petre should be used. I usually put a table spoonful or two of molasses on the flesh side of the ham, a little before it is salted, and after the molasses is rubbed over it, a heaping spoonful or two of finely pulverized salt-petre, the ham supposed to weigh, when cured, from twelve to fifteen pounds. I put nearly the same quantity on the middlings and shoulders, and proportionably on the smaller pieces, believing that it essentially contributes, not only towards improving the flavor and appearance, but also to the preservation of bacon, and as a preventive against the worm, bug and skipper. In order to ensure perfectly sound bacon, the pork must be salted at least twice. The second salting should take place about the third day after the first, at which time I add about a third of the quantity of salt-petre applied in the first instance. If, however, the pork should be frozen when salted in the first instance, it should be re-salted as soon as practicable after it thaws; without which there is great danger of injury. I use the Liverpool sack salt, and prefer it on account of its fineness. A bushel to the thousand weight of pork has been supposed a sufficient and freedom from public cares, which, however quantity. I think it too little, and would not by desirable, it takes some time to realize; for, any means advise that there should be a stint of strange as it may seem, it is nevertheless true, that salt. Five pounds of salt-petre to the abovemen- it was not until lately I could get the better of my tioned quantity of pork, is, perhaps, quite enough, usual custom of ruminating, as soon as I awoke Care should be taken to let the brine drain off in the morning, on the business of the ensuing from the pork, whilst in salt, as its contact with it day; and of my surprise on finding, after revolvtends to injure its flavor. If salted in casks, there ing many things in my mind, that I was no longer should be a hole in the bottom, after the second a public man, or had any thing to do with public salting, that the brine may escape. There are transactions. I feel, as I conceive a wearied travdifferent opinions as to the length of time the clier must do, who, after treading many a painful pork should remain in salt. I would recommend step, with a heavy burden on his shoulders, is four weeks. It salt-petre, in sufficient quantities eased of the latter, having reached the haven to be used, fat pork can hardly be made too salt. I which all the former were directed, and from his have known prime excellent bacon to remain in house top is looking back, and tracing with an salt more than three months. The last operation eager eye the meanders by which he escaped the in curing of bacon is the smoking of it. This quicksands and mires which lay in his way, and jurious, but promotes and facilitates, I believe, the the bustle of a camp, and the busy scenes of pub-

ordinary winters, is true. But in such a winter as heartfelt satisfaction. Envious of none, I am delast, when the thermometer ran, in 24 hours, from termined to be pleased with all; and this, my dear between 30 and 40, to between 60 and 70, and friend, being the order of my march, I will move remained so for four or five days, I do not think gently down the stream of life until I sleep with that fat and large pork can be saved by any real my fathers." sonable attention to it .- Western Tiller.

Extract of a letter from a gentleman in Baltimore, to a gentleman of this city.

"The new mode of applying friction rollers to with ten fiftysixes and two men, weighing at least a half pound weight, attached to a string, running over a pulley. The railway upon which it was tried, was perfectly level. A finger would move the car in either direction.

"In England, as well as in this country, it is found that a horizontal traction of 112 pounds is that the average effect is greater than that of 112 pounds,) and thus assuming that a load for one horse be 10 tens, (this is also a minimum,) we can tell exactly that one horse will draw with facility eightufive tons, with the aid of the very important invention above mentioned. The machine is exceedingly simple, and I am satisfied will not wear out so fast as the common rail-road car."

The following is a fine picture of Washington, in his retirement-it is from one of his own let-

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

CLIMATE AND SILK.

MR FESSENDEN-It is a curious fact, that ancient impressions are often transmitted on the minds of successive generations, long after the original cause has ceased; it is so with us in respect to our climate : the rigors of the winter season in former days, and extreme variableness with sudden transitions in spring and summer, have long since gradually softened away; their primitive harshness is gone, and no more to be found, than puritan intolerance and roughness are to be traced in the mild and enlightened spirit of the age .-Yet the impression formed in old times, that our climate is unpropitious for the purpose of rich cultivation, seems to remain yet, hovering occasionally, about the thoughts of some of the best friends to agriculture. It is to be regretted, inasmuch as it leaves doubts, where there is no foundation for any, and may create a hesitation and timidity uufavorable to a successful issue.

This is particularly applicable to the introduction of the culture of Silk, which being the product chiefly of mild countries, doubts are sometimes expressed as to the propitionsness of our own. Upon a careful investigation we may, however, be fully satisfied that our circumstances, taken together, are perfectly favorable, and equal to those of any silk country whatever in Europe. The first object to consider, is the food requisite to procure that rich crop, and there we find our case perfectly secured. The White Mulberry grows freely on our warm light lands, and their growth is rapid; their prosperity is not impaired in the least by the cold of winter, nor the variableness of spring; no insects attack the leaves, nor the bark of the trees, and the climate and soil appear to be as congenial to them, as they are to the White Oak and other natives of the forest .-They are very tenacious of life, for, after being cut down close to the ground, the stumps will furnish many suckers around, and on their being torn off, will send forth others for years in succession. These hardy trees are to support the delicate inseets from whose labors the rich crop is to be obtained. We may, therefore, assure ourselves that by using common care and diligence, we can make certain of the greatest abundance of food for them. Their introduction to existence may be regulated in some measure by our will, and as the period of their life does not exceed two months, there is every chance to secure for them that warm and even temperature which is needful.-In fact the seed should be kept in a cool place until the young leaves of the mulberry begin to appear, it should be then set to batching, which would be some time in the early part of June, and in about two months from that period, the crop would be secured, which would be in general before the 20th of August.

From the 10th of June to the 20th of August our climate is subject to no variation of temperature, but what common care with common accommodations would render perfectly harmless. doubt much whether the silk districts of France and Italy, or any of them, offer in that respect any advantages superior to ours. In France silk is raised chiefly in the departments bordering on the increase his earnings and means of support; no Mediterranean, and at times, dull humid weather large family of children but might, under proper

down on the steps. As soon as such turns come on, the doors and windows of the apartments allotted to the silk worms are to be closed carefully, sea turns along the shore offer no dangers equal to it. As to the middle and lower parts of Italy they are often visited with a hot wind from the coast of Africa, which raising a strong evaporation from the Mediterranean, blows it to the Italian shores. This wind, called the Sirocco, is extremely damp, relaxing, and dull, and against it they must prepare in order to preserve their silk guard against, is the great frequency of thunder worms, unless the doors and windows are immediately closed. We may say, therefore, that from the upper parts of the Mediterranean, to the lower parts of Italy, the whole of that chosen silk country is under the necessity to provide substanand windows, which are continually needful to preserve them from destruction. After all their precautions and care, their crop will at times suffer greatly, and once perhaps in a generation, an their warp and organzine mills, and the apprehension that a total stillness for a whole season, might

So far as natural advantages can assist, it is difficult to conceive in what particulars we could be more favored, and we might as well doubt of the ability of a rich grazing country to raise a competent stock of neat cattle, as to hesitate to proclaim New England, a country chosen, and fit, for the rearing of silk; where the food for the worms may be procured in the greatest abundance, and with as little labor as anywhere in the world .-Our pure and vivifying atmosphere, our soft and quick waters, will insure silk of the firmest staple, and of the first quality for beauty and usefulness.

If we are friendly to our own presperity, the seed of the white Mulberry should be sown generally and extensively, in all our towns, this coming spring. No farm should be without a plantation of these hardy trees, both in hedges and in orchards near the dwellings; no laborer's cottage should be without a small plantation of them; no poor house without a good and sufficient lot of ground laid out for that valuable purpose. The introduction of this culture would benefit all; no farmer's family but the daughters and children would pleasantly exert their industry to raise a crop as sterling as gold, which would substantially contribute to their prosperity by furnishing them the means to pay for good clothing, and have left besides abundant pocket money; no laborer but might greatly

lier the moisture gathering on the walls of the under the superintendence of a good master, to supstair cases in the interior of the houses, will run port comfortably the aged inmates, and exact from the idle, at least, the cost of their thoughtless existence, and relieve the community from the burden of these establishments; the widow's little place should the leaves to be gathered before hand, or dried have white Mulberry trees all around; poverty, for them. We have nothing in New England to dejection, neglect of virtue, intemperance, might guard against, of so unfavorable a nature. Our in many cases be redeemed, vanish, and he replaced by hope and industry, where the encouragement, and the means, should be pointed out, and of so easy an attainment.

The land once stocked with extensive plantations, and regular crops of cocoons obtained, wealthy individuals would soon raise filatures and mills, to prepare the rich article on a large scale for the use of silk weavers; the manufactories of Another serious evil which they must London and Lyons often have times of inactivity, when the weavers being out of employ and disstorms during the silk season; which in that tressed, would joyfully transfer to our shores their climate will cause a great destruction among the art and their industry. Create first the food, an abundance of the raw materials will be the necessary consequence, and theu the hands to manuture it will quickly abound. It regards every farmer's individual interest, to exert himself to secure a share in the culture of silk, of which no other crop tial stone buildings to raise the worms, with doors we have, can be compared to it for richness and excellence. But in a sense of public duty to the powerful community of which we are members, the exertions ought to be great, as it would make a vast addition to our general resources .-almost total failure. Such a calamity took place The cotton manufactures are dependent on the about the year 1784, when the silk crop in Italy South for their raw materials; silk would be our was so nearly destroyed, that they did not make own, and nations, as individuals, cannot be too sufficient raw silk to enable them to set in motion careful to secure within themselves means for their prosperity and greatness.

It seems to be a special duty for towns, to see that spoil the machinery, prompted them to get from proper measures should be taken in their respective London several hundred bales of Bengal raw silks, poor houses to raise without delay, nurseries of young with the assistance of which, they saved their Mulberries, not only for their own plantations, but machinery from destruction, and their people from also for the inhabitants to be supplied with, at a moderate price. The poor houses should be foremost, that they may secure a sale for their trees. and afterwards for the seed to raise the worms .-If these establishments, or some of them, should take the lead, it would not only subserve their interests greatly, but they might become, in time, the head quarters for information, and for the introduction of gradual improvements and perfection. Such well regulated Houses of Industry as those of the city of Boston, and Salem, might diffuse benefits in this new undertaking, far and wide over the land. There can he no doubt but individuals who have connexions in Europe, would delight to procure Mulberry seed from the best silk countries, and also seed of the different kinds of silk worms, and models of the machines used for winding and reeling, if they knew before hand, where they could consign them, for results of public diffusion and usefulness.

With great respect. I am your friend and serv't, T. G. FESSENDEN, Esq., J. M. G. Editor of the N. E. Farmer. Weston, Ms. Feb. 19, 1829.

PEAR AND PLUM TREES.

MR FESSENDEN-You will receive with this ommunication, an extract from a letter, received last mouth, from J. Buel, Esq., of Albany, containing an interesting history of the disease in the proceeds from thence, with an obscure, relaxing directions, be made to secure a rich return from Pear and Plum, which he has witnessed in his atmosphere, to such an extreme, that in Montpe- their industry; no poor house but might be made, part of the country. Comparing the date, when

it appeared among us, we shall find it simultane- on drop, which I received from the L. H. Society, from a hug or miller, or any other cause, we must drop which ripens as early as the Mirabolam, leave it to our distinguished entomologist in Milton. This we know, it gives great concern to the about a dozen new varieties, all seedlings but one reflecting horticulturist, to find his fine trees dying or two. I have seen most of the fruits, and deem in succession.

As for the loss of our plum trees, and destruction of the fruit, by the curculio, their depredations are now familiar with us; we expect but little. even with care. However, I think they are diminishing, and hope the time will soon arrive, when a display of this fruit from our gardens, may compare with that, raised last fall, in the fine gardens of Albany, Troy, and the vicinity. The disease which affects the pear trees, commenced here, in 1826-7. S. G. PERKINS, Esq., of Brookline, lost many trees; some fine and healthy. Mr SAMUEL WARD, of Roxbury, from his fine fruit farm, lost between one and two hundred. This same disease destroyed on his place, a number of pear trees in 1804-5. My garden has likewise This disease was worse there than I have ever more recently suffered; and doubtless others in the vicinity.

Dorchester, 20th Feb. 1829.

Albany, Jan. 26, 1829.

DEAR SIR-Your favor of the 16th inst. came duly to hand.

In replying to your inquiries, I must premise, that being comparatively a novice in gardening, and many of my trees not having come into a bearing state, I shall not be able to give the ample description you desire.

Schuyler's Gage. This bas not borne with me, though I have eaten it at Mr Dennison's. I think it is one of our latest plums, under medium size, round, and of a greenish yellow color. If my recollection serves me it is sometimes called the white damson.

Royal Blues are the same, I think, as the Fotheringham. I ate this fruit some years ago, at the late Chancellor Livingston's, on the 16th July, under the name of the Orleans. It is a pretty large fruit, oblong shape, and blue color-tree thrifty. Mr Dennison thinks with me that it is a Fotheringham, though Loudon describes the Fotheringham as of a dark red color. A fine plum.

Bleecker's Gage is a fine large yellow plum, raised originally from a pit brought from Germany, and presented to the lady of a clergyman by the name of Bleecker. It is sometimes called the German Gage. When ripe, its flesh appears through the skin varied like the gooseberry. It is one of our most popular fruits. We have some hundreds of natural stocks of this plum.

Bolmar is the same as the Washington-is quite a large plum, oblong, and of a greenish yellow .-Its size has acquired for it a reputation greater than it deserves, though it is a superior plum. It is said to have originated in New York with a Mr Bolmar. Vigorous tree.

Banker's Gage is an Esopus seedling: and is undoubtedly the best plum I know for drying. I have seen vast quantities dried at Esopus; where they are used in various ways during the winter. They are above the medium size, rather long, blue color, and remarkably rich and juicy. I have several hearing trees.

I have eaten and admired Mr D.'s French plum, but cannot describe it. The truth is, my absence last summer prevented my taking down the des-

ous in the different states. If this disease springs has not borne fruit. We have an early Golden

We have added this winter to our collection them a great acquisition. I forgot the cuttings of my new plum when I sent your trees, but will forward them in the spring.

I first became acquainted with the tumors on the plum tree in 1801, at Kingston (Esopus.) destroyed thousands of trees in that village. began to abate in 1809-10, and although it has not entirely disappeared there, it has very sensibly decreased. In 1805 the disease on the limbs of the pear tree made its appearance there, and extended to the apple tree also. Various expedients were adopted to check its progress, such as hanging iron hoops and straps in the crotch, boring holes into the trunks, and filling them with sulphur, mercurial ointment, &c. but to little effect. seen it since, and destroyed four-fifths of the pears and many apples. It ceased in about 1810, and has now partially reappeared. In 1827 I observed it in various parts of Pennsylvania and New Jersey; and the last summer I noted its progress 100 miles north and 150 west of this city.

The great enemy of the plum, and indeed of all stone fruit, with us, is the curculio, or other insect which punctures the young fruit. This cannot be the same that causes the tumor; for while my fruit suffers severely the wood remains sound and

I take the liberty of sending you the constitution, &c. of a Society which we have just formed to promote improvement in horticulture.

Very respectfully, Your obedient servant. S: Downer, Esq. J. BUEL.

FOR THE NEW ENGLAND FARMER.

BROAD WHEELS.

MR FESSENDEN-In your remarks on broad wheels, (Jan. 2,) you quote Edgeworth, that "cylindrical wheels, and straight axletrees have been unequivocally preferred."

Let us have the whole truth on the subject .-So useful an article ought not to be left open to successful attack. If any person for any reason prefers a conical axle, and there are reasons to be weighed, then the bottom of the axle may be made horizontal, the exterior of the wheel just as conical as the axle, and the effect is the same as that produced by a cylindrical wheel, and axle.— In this case it will doubtless be well to incline the axle a little forward, making the angle between its foreside and the line of forward movement, less obtuse than that between the hinder side and the line of movement. In theory this may seem to occasion the wheel to scrape laterally on the surface of the road, but it is not reality; for the inclination must be only such as to counteract the tendency of the wheel to work off from the axle. and press upon the nut or linchpin.

Alna, Me. Feb. 20, 1829.

QUERE ON THE CULTIVATION OF SU-MACII.

A correspondent at Eden, Maine, wishes to be eription of plums that I intended. My Cais Gold-cultivated, and where seed can be obtained?

To these queries we reply that we have never heard of the cultivation of sumach in this part of the country; and perhaps the commonness of the plant in its wild state may have precluded it from our fields and gardens. Loudon mentions it in his Encyclopedia of Gardening, in the index, only, under its botanical name Rhus, and says "the hardy kinds grow in common soil, and are increased by cuttings of the roots or layers."-If any of our friends or correspondents will furnish further information on this topic, they will lay us under great obligation and its publication may render a benefit to the community.

M'Mahon says "The various kinds of Rhus or Sumach, may be propagated by suckers, layers, or seeds. The seeds, if preserved in sand, and sown early in March, will rise freely the same season, and when one or two years old may be transplanted into nursery-rows, and having had their two years growth, may be planted where intended to remain.

HORTICULTURE.

Extract from an Address, delivered to the Jefferson, (N. Y.) Agricultural Society, by JAMES LE ROY DE CHAUMONT.

I cannot pass in silence the great neglect of our gardens, the more so when the perfection to which our garden vegetables arrive, is a convincing proof of the excellence of our climate and soil. Born and educated in what is called the garden of France, and fond of Horticulture, I can assure you with confidence that the vegetables of that favored country do not equal ours. Besides the more common vegetables, those two most valued the cardoon and cauliflower grow here finer than I ever saw them; and we need not exclude from our gardens any southern production of the United States. I planted this year, much too late, from the difficulties of getting the seed here, some Carotina or sweet potatoes. They were planted in the open ground on the 9th of June, and you will see a few samples of them this day, which though not grown to their size, will prove that they may be raised without extraordinary care. The sea kale, the Broccoli, the egg plant, and the rhubarb, commonly called the pie plant, are very desirable varieties for our tables. This last plant has a wonderful growth, and requires very little care here, and when we consider the early period in the year when we can use it to make pies, we must not be without it.

Cider Brandy .- A gentleman who has been for twenty years engaged in mercantile business, told me, that, during our last war, he went into the State of New Jersey, and in a certain district purchased of the farmers domestic spirits. His impression at the time was strong, that their free use of cider brandy would undo them. Five years afterwards, he visited that place again, and not one of those who were landholders at the time of his first visit, remained. Other men owned those beautiful farms and dwellings. Their great orchards and cider brandy had turned out the first owners pennyless upon the cold compassion of the world .- . V Y. Observer.

At a meeting held at Sterling, last Tuesday? of which the .Hon. JOSEPH G. KENDALL Was Chairman, it was determined to take measures for extending the Blackstone Canal to Fitchburg ; and Committees were appointed to cause surveys. informed if Sumach can be cultivated, how it is of the route to be made, and to raise funds to meet the expense of such surveys.

Effect of Hot Water on Flowers .- The following fact is deserving of record, as an interesting addition to what has hitherto been discovered on the subject of vegetable physiology, and as enabling the lovers of flowers to prolong for a day the enjoyment of their short lived beauty. Most flowers begin to fade after being kept twenty-four hours in water; but all (the most fugacious, such as the poppy and perhaps one or two others, excepted) may be completely restored by the use of hot water. For this purpose-place the flowers in scalding water, deep enough to cover about one third of the length of the stem, and by the time the water has become cold, the flowers will become erect and fresh; then cut off the clodded ends, and put them into cold water .- Patriot.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, FEB. 27, 1829.

HORTICULTURAL SOCIETY.

At a meeting held at the office of ZEBEDEE Cook, Jr, in this city, on Tuesday last, Gen. H. A. S. Dearborn, after a few pertinent remarks upon the objects of the meeting, proposed its organization.

The Hon, John Lowell was appointed Moderator, and Zebedee Cook, Jr, Secretary.

The meeting then proceeded to choose a Committee of three for the purpose of preparing a Constitution to present to the Society at an adjourned meeting, to be called by the Chairman of the same, when they should be ready to report.

A Committee consisting of five was appointed to procure subscribers. Books for this purpose are opened at the New England Farmer office, and at the office of the Secretary, 7 1-2 Congress street, where all who are so inclined, are invited to call and sign their names.

ZEBEDEE COOK, Jr, Secretary. Boston, Fcb. 24, 1829.

TOES.*

and beast is so generally appreciated that any at- can obtain." tempt to improve the quality of that vegetable will, no doubt, be considered interesting by the ing scedling potatoes is to be preferred to any agricultural part of the community. In England, other modes of which we have seen any account, we are told, the farmers hold it to be indispensably in the following modifications of his process, viz: necessary to renew their potatoes from the top In planting the balls or pieces of the balls instead seed once in fourteen or fifteen years, to prevent of planting the seeds merely. Nature designs that their degeneracy, both as respects quantity and the pulp, or nutritious matter, contained in or conquality. The Essex Agricultural Society have stituting what botanists denominate the pericarp granted premiums for raising potatoes from seed, of the seed, shall furnish nutriment to the young and a report on that subject, signed by the late plant, while yet in embryo, and before it obtains Col. Pickering, chairman of a committee of that the organs and the vigor necessary to enable it to society was published in the New England Farmer draw nourishment from the soil. It has been revol. vi. p. 93.

Mr Daniel Putnam of Danvers, and Mr Daniel better for being sown with the pomace in which Burnham of Newburyport, presented, at the Essex they are enveloped, when taken from a cider-mill. Cattle Show in 1827, various samples of potatocs, Dr Darwin observes in his Phytologia, that "To being more immediate and penetrating. grown in 1827, produced from seeds taken from sow seeds advantageously, it is probable, that those the green balls in the autumn of 1825, and sown of our native plants might be suffered to drop out time or age having no effect upon them. in the spring of 1826. It is further stated, that the surface of the earth in autumn, or to fall from "To prevent any mixture of the different sorts it their parent plant covered only by their deciduous was necessary that the product from each single leaves, in which situation their fruit might contriseed should be kept by itself; and that this pro- bute to nourish them." And again, "Where the calculated upon these proportions, that is to say, duct of each sort, planted in the spring of the fruit, which surrounds any seeds can be sown with in regard to freight, land carriage, warehouse succeeding year should also be kept separate from them it may answer some useful purpose. Thus room, and cost of store rent, &c.

or a half peck to each hill.

" Of Mr Burnham's best sort (they were white) large, and all of excellent quality, being very mealy and finely flavored.

"The merits of these two sorts of potatoes, taking them for all in all,' appeared so equal that his forwarding the young plants in his green house. to do equal justice to the two claimants, the committee decided to blend the different premiums and caused the produce the first year to consist in part divide the same equally between them.

"The committee have reason to think that as the potatoes of the second year's growth from the seed, appeared to be superior in texture and flavor the product of the third year may be superior to that of the second.

"The seeds are thus saved. In autumn, or whenever the potatoes are ripe, some of the green balls are collected; and the pulp being soft, they are mashed by hand, and by washing them in several waters, the seeds are separated and made clean. These being well dried, are saved till seed time in the ensning spring, and then sown in drills, in the manner in which garden seeds are sown. The most vigorous plants when four or five inches high, may be transplanted to another bed, at the distance of a foot from each other. Or the smaller plants growing between the best may be pulled up; leaving the best about a foot apart, in order MR TIDD'S NEW VARIETIES OF POTA- that the product of each plant may be kept by itself. It will doubtless be expedient to sow seeds The importance of the potato as food for man from the best sorts of potatoes the experimenters

It appears to us that Mr Tidd's mode of obtaincommended to plant peaches whole instead of the By the abovementioned report it appears that kernels; and apple seeds are said to succeed the every other sort. These precautions were duly the fruit of crabs, quinces, and some hard pears will lie all the winter uninjured, covered only with

observed by Mr Putnam and Mr Burnham, and their autumnal leaves, and will contribute much to each of them now exhibited satisfactory proof of nourish their germinating seeds in the spring. So their success. They selected the best of the vari- the holly berry and the ivy berry remain during ous sorts they had cultivated. The superior sort the winter months uninjured by the rain or frosts, of Mr Putnani's was red, and in shape and ap- and undevoured by birds or insects, and contribute pearance exactly resembled the long red or River to nourish their germinating seeds when they fall Plate potato; but was incomparably better, being to the ground in the spring. The acrid husk of very mealy and finely flavored. One single seed-walnuts, sown along with them, preserves the ling plant of 1826 produced only four small pota-sweet kernel from the attack of insects; the same toes; but these four, planted the last May, each must be the use of the acrid oil of the cashey nut. one in a hill, in good ground, yielded half a bushel, The hawthorn possesses both a nutritive covering, and a hard shell for the above purposes; and the seeds of roses are armed with stiff pointed bristles, two potatoes grown from one seed in 1826, and as well as furnished with a nutritious fruit; the planted about the middle of last May (1827) yield-former constitutes a defence against insects, and ed ten pounds of potatoes, some of them very the latter supplies a reservoir of nutriment for the germinating seeds."

Another (as it appears to us) favorable circumstance with regard to Mr Tidd's experiments, was It was this acceleration of their growth which of "fair sized potatoes and a few larger than the average growth of early whites." Mr Tidd has thus, not only gained a year's time in forwarding his experiment, but it is probable that he has to the small seedling potatoes of the first year, so thereby obtained more vigorous and prolific varieties than he could have done by common culture. Young plants as well as young animals should be well fed in the early part of their growth, or they will not attain the excellence of which they are canable.

> Early Asparagus .- Mr R. Toohey, gardener to the late Gov. Gore, has left at the New England Farmer office, Feb. 24, some bunches of asparagus, six inches long, which we expect is the first cut this season, in this vicinity.

> Agricultural Societies .- A bill to continue in force, for the term of five years, an act for the encouragement of Agriculture and Manufactures, passed the Massachusetts House of Representatives, on the 21st inst.

> Rail-Roads .- On the 23d inst. the Legislature of Massachusetts resolved, that it is expedient for the state to aid and encourage the construction of rail-roads, by its funds. The further consideration of the subject is postponed to the next session of the Legislature.

Extract of Sumac .- From a communication of Richard W. Otis, Esq., to Dr Samuel L. Mitchell, dated Dec. 20th, 1828, with a sample of the article, as prepared in Sicily.

This extract contains all the efficient properties of Sumac, used in dying stuffs and yarns, as well as in tanning skins. It consequently answers the same purposes, and can be substituted to common Sumae in all circumstances.

One part of this extract produces as much effect as ten parts of Sumae, and even more, its action

Its qualities preserve themselves unchanged,

This extract occupies one-hundredth part the volume of common Sumac, and its weight is ninetenths less. It advantages must accordingly be

A small quantity of tepid water dissolves it. In its application to the arts, that quantity of

See the last No. of the N. E. Farmer, p. 242

water only is required which is necessary for the immersion of the stuffs, threads and skins. Thus, almost all the fuel commonly used, is saved; there almost all the fuel commonly used, is saved; there the fuel commonly used is not saved; there is the fuel commonly used is not saved; there is the fuel commonly used is not saved; there is the fuel commonly used is not saved; there is the fuel commonly used is not saved; there is the fuel commonly used is not saved in the fuel commonly used in the fuel common is a great saving of labor, and in many instances boilers are unnecessary. When boiling water is not required in certain operations of dying or of tanning, a small kettle may be used, wherein the extracts may be dissolved over the fire, after which it may be poured out into a wooden vat, which may be filled up with the quantity of water wanted .- N. Y. Farmer.

Alcohol from Blackberries .- Mr Evans lately showed the editor of the Technological Repository a very fine specimen of pure alcohol which he stated he had distilled from a very common and well known Euglish vegetable, but which he had never before known applied to this purpose. The alcohol had the flavor of French brandy. Mr Edwards said, that an experiment was now making on a large scale in North Wales to cultivate the brambles for this purpose; that they readily grew from cuttings planted in a good soil, and which produced fruit the same year. They were to be trained on low frames to prevent them from trailing upon the earth, and the berries were greatly increased in size from the culture. He does not intend to patent his discovery, but to exercise it for the benefit of the public.

The State of Ohio has borrowed five millions of dollars to construct her canals, and it is supposed she will require a few additional millions. Capital is not wanting for a good investment.

To Correspondents.-We are obliged to defer this week, some able remarks from a respected correspondent, on Mr Tidd's experiments on Potatoes, and some other articles.

Farm for Sale.

In Bedford, 15 miles from Boston, on the post road from In Bedford, 15 miles from Boston, on the post road from Lowell to Concord, Mass., and one mile from the post road leading through Lexington to Worcester. It contains 80 acres, has 35 pastures, a wood tot of about 8 acres, an inexhaustible peat meadow, and about 36 acres of mowing. The dwelling loose has two parlors, a large China closet, an excellent kitchen, and six chambers, and there are two wells of water. The barn, corn barn, and poultry house, &c., are in the best order. It is 3 miles from Concord, one half mile from Concord river, where is good fishing, and 10 miles from Lowell. The above premises were completely repaired within and without last premises were completely repaired within and without last spring. The dwelling house has had three coats of paint inside and out. It has a southern aspect, several large Elm trees in front, a handsome and extensive fence and circular avenue, Inquire at the New England Farmer Seed Store.

"What but a LOTTERY is the law, Whose Lawyers all the PRIZES draw. Their clients give them many thanks, For privilege to draw the BLANKS."

"Physicians manage Lotterywise, Here death 's the BLANK-and health the PRIZE; And 'tis a truth, which most men feel, There's but few PRIZES in the wheel."

"What hopes can starv'ling poets feel, When there 's no PRIZES in the wheel. For should they draw the phantom fame, "Tis but a BLANK-an empty name."

From Good's Book of Nature.

VENTRILOQUISM.

Lewis Brabant, valet de chambre of Francis 1. of France, was a skilful ventriloquist; and fell desperately in love with a young, beautiful, and very wealthy heiress, whose father forbade his addresses in consequence of the disparity of his condition. After the decease of her father, Brabant, unsubdued by the first repulse, determined to make another push, and to call to his aid, if neeessary, the art of ventriloquism.

He accordingly waited on the mother, and once more submitted his proposals. But faithful to the views of her deceased husband, she gave him a direct refusal. While in the act of so doing, a low, hollow, sepulchral voice was heard by herself, and by all present, and which was instantly recognised as the voice of the deceased, commanding the widow to give her daughter's hand to Lewis Brabant, whom the spirit affirmed he now knew to be a worthy and an excellent man, and much wealthier than he had taken him to be when alive : adding, at the same time, that he was suffering in purgatory for having ill-treated, by his refusal, so exemplary a man; and that he would not be released till his widow had consented.

All was mute astonishment; but Brabant appeared more astonished than the rest. He modestly observed that whatever his merits might be, he had no idea that they were worthy of being commemorated by a voice from the grave; but nothing could give him more pleasure than to be made the happy instrument of extricating the old gentleman from the pains of purgatory, which it seemed he was suffering on his account. There was no doubt as to the voice; no time was to be lost; the mother and the whole family immediately assented, and Lewis Brabant had the honor of receiving their commands to speedily prepare for the nuptials.

To prepare for the nuptials, money was necessary; but Brabant was destitute of such an article. He resolved to try whether the same talent which

by usury and extortion, and whose conscience appeared often measy in consequence of the means which he had used; and he thought that Cornu was the very character that might answer his purpose.

To Lyons, therefore, he went, post haste, commenced an immediate acquaintance with Cornu, and on every interview took care to contrast the pure happiness enjoyed by the man whose conscience could look back, like M. Cornu's, as he was pleased to say, on a life devoted to acts of charity and benevolence, with the horrors of the wretch who had amassed heaps of wealth by injustice, and whose tormented mind only gave him now a foretaste of what he was to expect hereafter. The miser was always ready to change the conversation; but Brabant pressed it upon him, till finding, on one occasion, that he appeared more agitated than ever; and at that instant a low, hollow, solenm, sepulchral mutter was heard, as in the former ease, which was found to be the voice of Cornu's father, who had been dead some years, and which declared him to have passed all this time in the tortures of purgatory, from which he had just now learned that nothing could free him but his son's paying 10,000 crowns into the hands of Lewis Brabant, then with him, for the purpose of redeening Christian slaves from the hands of the Turks.

All was unutterable astonishment; but Lewis Brabant was the most astonished of the two: modestly declared that now for the first time in his life, he was convinced of the possibility of the dead holding conversation with the living : and admitted that, in truth, he had been employed in redeeming Christian slaves from the Turks.

The mind of the old miser was distracted with a thousand contending passions. He was suspicious without apparent cause; filial duty prompted him to rescue his father from the abode of misery: but 10,000 crowns was a large sum even for such a purpose. At length he adjourned till the next day to meet in another place. He required time to examine into this mysterious affair, and he wished, as he said, to give his father an opportunity of trying whether he could not bargain for a smaller sum.

They accordingly met the next day, and agreeable to Cornu, on an open common in the vicinity of Lyons, where there was neither a house, nor a wall, nor a tree, nor a bush, that could conceal a confederate. No sooner, however, had they met than the old miser's ears were again assailed with the same hideous and sepulchral cries, upraiding him for having suffered his father to remain for 24 hours longer in the torments of purgatory; denouncing that, unless the demand of the 10,000 crowns was instantly complied with, the sum would be doubled; and that the miser himself would be condemned to the same doleful regions, and to an increased degree of torture. Cornu moved a few paces forward, but was assailed with still louder shrieks: he advanced again, and now instead of hearing his father's voice alone, he was assailed with the dreadful outcry of the whole Cornu family for the last two or three generations, all suffering in purgatory, and all included in the general contract of 10,000 crowns; all beseech-He resolved to try whether the same talent which had obtained for him the promise of a wife, might not also obtain for him the promise of a wife, might not also obtain for him the money wanted. He recollected that there lived at Lyons an old miser, M. Cornu, who had accumulated immense wealth and felt some pleasure that by postponing the paying him to have mercy on them, and to have

ment for one day, he had at least been able to reseue the whole family of Cornus for the same sum of money, as was at first demanded for his father alone. The dextrous ventriloquist having received the money, returned to Paris, married his intended bride, and told the whole story to his sovereign and the court, much to their entertain-

REPARTEE.

When Madam Heinel drew the fashionable world to the Opera some years since, by the avowed superiority of her graceful attractions, the then Earl of Harrington, of amorous notoriety, on the morning of her benefit, enclosed her a bank note of 500 pounds, which the heroine sent back with the following reply.

"My Lord-I could not hesitate a moment in returning the bill you did me the honor of enclosing me. If your Lordship meant it as a reward for my public performance, it is infinitely too much -if it is intended as a prelude to any private rehearsal, it is in my opinion, as far too little."

> Yours, &c., HEINEL."

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

MR TIDD'S EXPERIMENTS OF RAISING NEW VARIETIES OF POTATOES FROM SEED.

Mr Tidd descrees the thanks of the friends of agriculture, for the care, accuracy, and extent of his experiment in producing new varieties of petatoes from seed-and the public are not less deeply indebted to him for the clear, and satisfactory account which he has given of his experiment. think that he may dismiss a great portion of his fears, and embarrassments as to the future course of carrying his experiments into full effect. He may be assured, that there is not the great danger which he seems to apprehend in the confusi in of the new varieties which he has introduced & seed. If the potato ever degenerates by intermix ture of the tubers, which is doubtful, he may rely upon it that it is an exception, and not a general law.

I was sorry to find that the discovery of a single mixed potato should have led him to add the weight of his opinion to a doctrine, which it is believed is entirely unfounded.

No man has a greater contempt for mere theory than I have on subjects of natural history, upon which, we have so many opportunities of trying theory by its only true standard, experience. If the potato is subject to intermixtures by being ture, but the fact may be otherwise.

One of the benefits to be derived from a horticultural association will I hope he the settling the season in our orchard, and destroy the catersome of those doubts which have a mischievous pillars with Pickering's brush, and by crushing sciens will grow and come to maturity on apple the potato does not hybridize by planting dif-spend some weeks in catching bags of ants, for a time for cutting the sciens; also the best time to bills of potatoes shall be planted under the direction of a committee of the proposed society, and the poor creatures by starvation to wage an extension of the proposed society, and the poor creatures by starvation to wage an extension of the proposed society, and the poor creatures by starvation to wage an extension of the same ground where an old one

by the same committee, at the end of the second year, pronounced to be a new variety, or, in other works that its change is constant, and material. Sports in color occur in every sort of natural production, and I have often seen a white stripe in a red potato without any apparent cause-and without any permanent change.

A FARMER.

FOR THE NEW ENGLAND FARMER.

ANCIENT GARDENING.

Ma Fessenden-I have had the curiosity lately to peruse a work entitled The Art of Gardening, by J. Woolridge, printed in London in 1688, and another on Forest Trees, by Moses Cook, London 1675. 1 wished to compare the old method of cultivation with the improved systems of the present day. As might be expected all the advantage is in favor of the very valuable system published by you the last year, which I hope and trust is in general circulation. Woolridge thus culogises the art of gardening.

"Since gardening was the first and best vocation, And Adam (whose all are by procreation) Was the first Gard'ner of the world, and ye Are the green shoots of him the original tree : Encourage then this innocent old trade, Ye noble souls that were from Adam made; So shall the Gard'ner's labor better bring To his country profit, pleasure to his king."

I searched with the hope of finding something planted near together, then the laws of nature relative to the subject of my favorite insects, the have been always suspended on my estate for tel bees, but at that period, our fathers were unaslast twenty years. I never planted a single Wal quainted with any method by which they could of potatoes without two or more distinct varieties obtain the honey without destroying the bees .--the rows of course have interlaced each other Their method was to suffocate the industrious in--in some cases I have planted two varieties pro- sects, by the fumes of burning brimstone, which miscuously-two early varieties have been thus differs but little from that of skinning a favorite planted for ten or twelve successive years, with horse for his hide. The author noticed one inout producing a single mule or mongrel. If it be stance of culpable selfishness in a man who poisasked how this fact is ascertained? I reply, by the oned all the flowers in his garden, lest his neighroots, and by the foliage flowers. The two vari- bor's bees should extract honey from them. I was eties referred to differ in the shape and in the color amused with a paragraph designated, "an ingenof the roots, but the difference in the foliage and icus method of destroying caterpillars." It is first flowers is equally great. I determined the last year to apply a ring of tar round the trunk of the tree, rately I had the two varieties as pure as they were are prevented from coming down the tree by the choice, to spend a few days in the early part of trunk. ferent sorts contiguously, that I propose that 50 large orchard would require at least a bushel, and engraft them. the society to be distributed in premiums. But it should be understood that the supposed mongrel, pillar tribe from a large orchard, and at the extreme, if any at all. If any person will take the mule, or hybrid, shall be replanted, and shall be pense of very little time or trouble.

In Cook's book we have the following description of "A Witch-Elm in Sir Walter Baggots'

"Two men five days in felling it. It lay forty vards in length. The stool five yards two feet over. Fourteen loads of wood brake in the fall. Forty-eight loads in the top. Eighty thousand six hundred and sixty feet of boards and plank.

Eighty pair of naves were made from it. It cost ton pounds seventeen shillings for sawing. The whole substance was conceived to be ninety-seven tons.

It was felied in the year 1674.

"Reader, if thy faith hold out, read on : But if you find you can't helieve, be gone: For with more case a man might undertake To bring brute bear unto the fatal stake. Than him to teach, whose infidelity Does demonstration, reason, truth defy."

Cook.

The author closes his long chapter on the Oak, with the following culogium.

"O stately tree! who night can speak thy praise, Doth well deserve the laurel or the bays. Ask butour Thames what burdens thou hast bore Of goldand silver fine, and in their ore, Of Rubles, Diamonds, and Pearles most rare, With ot ers, which past valuation are: Of silks a sattins fine to clothe the back; Of wine Italion, French, and Spanish Sack: Of spice fruits, and many a rich dye, To satisfy and feast the curest eye: Of mastich, thyrrb, and many a rich gum; Aloes, and drugs which from the Indies come. He who loves this thy burden, and not thee, He deserves never to be worth one tree." Plymouth, Feb. 1829. MEDICUS.

Yours with respect, A SUBSCRIBER.

Taunton, Feb. 21, 1829.

Remarks by the Editor .- We shall briefly answer some of our correspondent's queries, and will be obliged to any experienced cultivator, who will furnish bim with more full and explicit information relative to the topics of his inquiries. And first with regard to grafting or inoculating pear trees. Although the general rules for propagating the apple tree may be applied to the pear tree, we will give Dr Thacher's directions on the subject. "The propagation of particular species of the pear tree is effected by grafting or budding, and by this method any desired variety may be obtained and perpetuated. Considerable attention is necessary in the choice of scions for grafting. Suckers from other trees should never be employed, as they will have a constant tendency to generate snckers to the injury of the tree. It should be observed to graft or bud summer pears upon summer pear stocks; antumn pears upon stocks of the same kind; but never graft a winter pear upon a summer pear stock, for the sap of the summer pear will decline or diminish before the winter fruit has sufficient time to mature and ripen. The season for grafting or budding, and the manner of performing the operation are the same as for the apple. The pear tree will succeed very well when grafted on a quince; in which case it an unexampled extent in this vicinity, and in the is preferable to graft under ground in the root, as the tree will be more strong and vigorous; whereas if grafted above the surface the produce will be a dwarf tree."

If it is intended to engraft the whole or the greater part of the limbs of trees of a considerable size, care should be taken not to cut off all the branches at once, but leave some of the lateral branches to draw up the sap till another season, as occasion may require; otherwise the trees will it, a very superior fruit. die for want of a proper proportion being preserved between the roots and branches.

With regard to grafting quince tree scions on say the writers, may be increased by grafting, cither on their own stocks, on pear stocks, or hawthorn stocks. But we doubt whether there is a sufficient degree of affinity between the quince and apple tree to unite them beneficially by grafting. Modern botanists consider the quince tree, The apple is a pyras, the quince a cydonia. They temporary, but not a permanent or flourishing union.

Planting fruit trees in the site of an old orchard, is a practice, which is attended with disadvantages. Indeed it has become proverbial that renewing or changing the constituents of the soil, fruits. about the trees, by compost, loam from a neighboring field, or other source, and suitable manure fit of the instruction of "A Brookline Cultivator," a flourishing new orchard may be made on the place where an old one has stood.

an orchard, and the best manure to put round the tion, is equalled only by the kindness with which

long treatise. Our correspondent may find some Under his directions I have the past season succondensed information on this subject in the 6th volume of the New England Farmer, page 394. Likewise in Thacher's Orchardist, Forsyth's Treatise, Fessenden's New American Gardiner, &c.

CITY AND COUNTRY.

Ma Editor-No better proof of the reliance that we of the city, are obliged to place upon the country, can be adduced, than the fact that during the non-intercourse occasioned by the late storm, MILK (that inestimable luxury in life, which is said to be the only article affording both meat and drink to man) became so scarce, that twenty-five cents a quart could have easily been obtained for The market, no doubt, experienced a scarcity in other articles for which we are accustomed to look to the husbandman's garner.

This shows bow entirely dependant the wealthy capitalist is upon the farmer, and how entirely independent the farmer is of the capitalist. Let neither then despise this honorable employment. The farmer for this exalted characteristic of his occupation, and the capitalist for his incessant obligation to look to it literally for his very existence. BOSTON.

FOR THE NEW ENGLAND FARMER.

ISABELLA GRAPE.

The cultivation of this grape has increased to the ground. neighboring States; and the demand for the vines, Apricot stocks from the stone or seed. is still as great as ever. With those who have not enjoyed the advantage of a successful culture of treatment. foreign varieties, and consequently are not so fastidions as to suppose that our own country cannot produce good fruits, the Isabella has become a great favorite, and when suffered to remain on the

It is well known to those who are acquainted with it to be a plentiful bearer; to make much wood, and to endure frosts with as much hardiapple tree stocks, we doubt whether a permanent hood as the ordinary vines indigenous to our forests, tance apart; season and manner of transplanting, and flourishing union could be effected. Quinces, The necessity, as well as labor of covering the and the manner of dressing and pruning them at vine in autumn, is dispensed with; and all that is requisite, or all that I have found so, is to cut them in, and secure them to the trellises, that they may not be broken or injured by the wind.

This grape should never be gathered until the first week of October, when it is in perfection. I and the apple tree as belonging to distinct genera. have in my garden n number of the vines, some six years and others five years old, they all bore are, however, of the same family, and probably, freely the last season, and the fruit sold readily in may be made by grafting or inoculation, to form a the market at twenty-five cents the pound. The vines are not subject to mildew, or the fruit to blight or to injury from the insects that attack foreign grapes. Like all other good things, however, they require care and attention, and excepting fumigation and the application of sulphur, the "where an old orchard has stood, a young one same course should be pursued in their cultivation will not thrive." But, by careful cultivation, and that is requisite for the more delicate exotic

It has been my good fortune to enjoy the benewhose scientific knowledge, and practical experience in such matters is proverbial, and whose in-With regard "to the best manner to cultivate telligent and familiar mode of imparting informawees" to give full information would require a the inquiries of the uninitiated are answered .- gathering, and preserving fruits.

ceeded in raising several varieties of foreign grapes, and most of them from vines, the product of his fine garden.

Having been thus successful I have directed my attention to the cultivation of the vine, both foreign and domestic, for sale, and have now many varieties, suitable for transplanting the ensuing season, and which will at the proper time, be offered through the medium of the Farmer.

ZEBEDEE COOK, Jr.

Dorchester, February, 1829.

We publish the following with much pleasure. From the high reputation of the AUTHOR of the proposed work, and from our personal knowledge of the Translator, we anticipate a volume, which will prove of great practical utility to all who are engaged in the culture of fruit trees.

NOTICE TO HORTICULTURISTS, FAR-MERS, AND OTHERS, WHO HAVE FARMS.

The many calls which have been made on the Editor of the New England Farmer the last two or three years for information of different sorts relative to fruits and fruit trees, and the best mode of treating them, has induced the writer to offer to the public a work which will contain from three to four hundred pages octavo, and treating of the following subjects, to wit:

- 1. The Nursery .- Quality and preparation of
- 2. Raising of Almond, Peach, Nectarine, and
 - 3. Rooted Suckers .- Their use and mode of
 - 4. Layers .ditto. 5. Slips or Cuttings .- Ditto. ditto.
- 6. Grafting and Budding .- General treatise, showing the kind of stocks to be used, the manner vine until properly ripened, has been found to be of treating them before and after the operation, a valuable, and I may add, from my partiality to the various denominations, kinds best suited to different sorts of fruit, choice and properties of various scions, and the manner of inserting them.
 - 7. Transplanting Fruit Trees .- The age and size of the plants, preparation of the ground, disthe time of transplanting.
 - 8. Trees raised in places where they are to remain. -Manner of treating them, preparation of the ground, advantages and disadvantages of this mode,
 - 9. Exposition of Espaliers-Relative to different kinds of fruit, &c.
 - 10. Season of pruning, and its objects,-Viz. the beauty of the tree, and its fecundity.
 - 11. Pruning of standards.
 - 12. Dressing and pruning Espaliers.
 - 13. Proportions in relation to the branches and roots; the course and progress of the sap; its action on the branches, buds, and leaves of trees.
 - 14. Definitions of branches, and the manner of treating each description.
 - 15. Treatment of dwarf or low bushy trees.
 - 16. First training of fruit trees in espalier.
 - 17. Shelter for wall fruit.
 - 18. Ebourgeonnement, or rubbing off superfluous buds from wall or espalier trees.
 - 19. Second training of trees in espalier.
 - 20. Diseases to which fruit trees are subject.
 - 21. Fruits-Time and manner of uncovering,

- small, weakly fruit.
- 23. Almond tree-Its varieties, its character, and the description of its growth, its shoots, its leaves, its blossoms, and its fruit-also its cultivation.
- 24. Apricot tree .- Its varieties, its character, the shoots, buds, leaves, and fruits of the several varities-also its cultivation and uses.
- &c, as above.
 - 26. Quince tree .- Its character, &c.
- 27. Strawberry .- Its varieties, character, culture, &c.
 - 28. Fig tree.—Varieties, culture, &c.
 - 29. Currants and Gooseberries .- Ditto. ditto. ditto.
 - 30. Apple tree .- Ditto.
- 31. Mulberry tree .- Ditto. ditto. 32. Peach tree .- Its character, varieties, description of the shoots, buds, leaves, seed, and fruit of each variety-also stocks best suited to it, soil,
- general culture, and order of maturity. 33. Plum trees .- Ditto. ditto. ditto. &c, &c.
- 34. Pear trees .- Ditto. ditto. ditto. &c, &c. 35. Raspberries.—Culture, &c.
- and its culture.
 - 37. Insects-That infest fruit trees.

The principal part of the volume will be composed of extracts translated from the celebrated work on fruits and fruit trees written by the highly distinguished and well known DUHAMEL DU MON-CEAU, in two quarto volumes; to which will be added such extracts from more modern authors on this interesting subject as may be thought useful at the present day.

A list also will be given of the new varieties of the several species of fruits which have been raised and brought into estimation since Duhamel's day, so far as they have come within the knowledge or observation of the translator; to which will be subjoined notes by the same showing the departures that have been successfully made from Duhamel's system, by cultivators both in England and this country .- The best mode of packing trees that are to be sent abroad.

The preparation for this volume is nearly completed; but it will not be published until 500 copies are subscribed for. It will be printed on good paper, and as good type as that in Forsyth's treatise on the "Culture and management of fruit The price will not exceed \$2 50 in in boards, nor be less than two dollars. This cannot at present be ascertained. Subscribers must therefore consider the highest price the one they are to pay, before they subscribe.

Booksellers who engage any number of copies, will have a suitable deduction made them according to the number they take, on application to J. .B. Russfll, publisher of the New England Farmer, who is also authorized to receive subscriptions for single copies, and transact any other business connected with the publication.

VIEW OF AGRICULTURE.

MR FESSENDEN-If you think the following synoptical view of agriculture, partly abstracted from Rozier's Dictionary, would afford amusement, or, what is more desirable, a useful hint to New Eng-S. D. land farmers, it is at your service.

Agriculture is the art of cultivating the ground, of fertilizing it, and of causing it to produce the grains, the fruits, the plants and the trees which good coal,-may be cultivated for fuel.

22. Manner of restoring fruit trees that produce are subservient to the necessities of man. To this definition should be added, that it embraces also the art of multiplying and of attending to the keeping or management of useful animals,-in fine, it is the first, the most extensive and the most essential of all the arts.

Theoretical Agriculture; or, Preliminary Notices. Soils. Process of Vegetation. Botany. Chemistry. Implements. Manner of multiplying plants, 25. Cherry tree.—Its varieties, character, &c, &c. Transplanting [in quincunx] Pruning; Grafting, &c.

Practical Agriculture.

Manures taken from the mineral kingdom: mixture of soils, sands, line, plaster of Paris, [gypsum] marl, &c. From the vegetable kingdom: turf, peat, ashes, decayed plants, &c. From the animal: of the horse, cow, sheep, hog, night soil, poultry, horns and piths, bones, &c.

Culture of Trees. Forest Trees .- Oak, elm, plane tree, maple, [sugar tree] chesnut, larch, pine, [hemlock, &c.] willows, poplars, &c. Ornamental Trees .- Horse chesnut, lime silia or linden, tulip tree, [liriodendron] locust, catalpa, ailanthus* or taloo tree, &c. Ornamental Shrubs.-Althea frutex, kalmia or laurel, lilac, rose tree, colutea 36. Grape vines .- Varieties, description of each, arborescens or bladder sena, holly, muck orange, buckthorn, &c.

Fruit Trees with stones: plum, peach, apricot, Trees with seeds: pear, apple, quince, mulberry white and black, grape vine.

Culture of Grains. Maize, rye, wheat, barley, buckwheat, oats, spetts. Somewhat farinaceous articles: peas, beans, millet, broom corn, &c. Oily seeds: flax, hemp, sunflower, colzat, benne, poppy, ricinus or castor oil plant. Culture of fleshy, plump plants: radish, turnip, ruta baga, potato, sweet potato, melon, cucumber, pumpkin, squash, &c.

Meadows. Artificial: clover, lucerne, sainfoin. Natural: bent, sweet scented vernal grass, orchard, timothy, &c.

Fruit Shrubs and Plants, for Kitchen Garden. Strawberry, raspberry, current, gooseberry. Onion Tribe: garlic, onion, cives, shallot, leek, ciboul or Welsh onion, potatoe and tree do. Culture of Cabbage: broccoli, hohl rabi. Artichoke. Asparagus. Beet: mangel wurtzel, and sugar beef. Parsnip, Carrot. Salsify, &c. Salads: celery, lettuce, cresses. Pickles: capsicum, nasturtium, cucumber. Medicinal herbs should have place; and some flowering plants, attractive by their graceful foliage, or the rich colors and fragrance of their flowers.

Miscellaneous Articles. Hops, poppy for opinm, teazels. Plants for coloring, &c: madder, woad, indigo, weld.

Agricultural Operations. Ploughing, harrowing, hoeing, sowing, reaping, threshing, mowing, havmaking, draining, paring and burning, manuring, fencing, rotation of crops, rolling.

Economical Agriculture, or Rural Economy.-Conservation of grains, fruits, &c. Method of making wine, perry, cider, beer. Manner of making oil of seeds of flax, sunflower, palma christi or castor oil plant, benne, [sesamum] &c. Preparation of butter. Manner of making cheeses of different sorts.

Becs,-their management, taking the honey, &c. Silk Worms,-their management, &c, &c.

* A tall, ornamental tree, of quick growth,-said to yield

Manner of preparing flax, hemp, and even nettles, for different uses.

The rearing and general management of all sorts of live stock, as cattle, horses, sheep, hogs, poultry, pigeons.

So multifarious are the concerns of agriculture.

TOR THE NEW ENGLAND PARMER.

REMEDY FOR POISONED SHEEP AND LAMBS.

These animals are sometimes poisoned by eating common low laurel, or lamb-poison as it is sometimes called. The cure is very easy and simple, and is as follows:

I take an onion and split it in two with a knife; and put one piece under each fore leg, with the flat side next to the breast. If the animal is so badly poisoned as not to he able to stand on its feet, the onion may be so placed as to remain in its proper situation a sufficient time; if not, hold the onion in its place 15 or 20 minutes, which will be sufficient to effect a cure. I have, sometimes, pounded the onion soft and applied it in that state, which, I think answers quite as good a purpose.

I have known and practised the above medicine more than 15 years; and have never known privet, broom, snow ball or guelder rose, hawthorn, it fail of effecting a cure in a short time, if properly applied, whatever might be the degree of sickness occasioned by eating poison, with this cherry. With shells: walnut, filbert, &c. Fruit preference over other remedies, viz: The sheep, cured by this method, appear to become as healthy as if they had never been poisoned; whereas whenever we used clay, oil, grease, &c. they, generally, shed their wool, and sometimes die before shearing time.

CARROTS AND PEAS.

My method of raising carrots and peas is as follows: I prepare my ground by spreading some good manure, plough it in, and make the ground mellow, by ploughing deep, and several times. I then mark it out with a plough, from 31-2 to 4 1-2 feet, according to the size of the peas I intend to plant; fill up and level the furrows, so as to lay the peas but a little below the common level of the ground (which I think of importance in planting all seeds.) Then plant the peas in double rows, which when covered form a ridge about eighteen or twenty inches wide. Then, by drawing a stick, or some convenient instrument near each edge of the ridges, make a furrow about three-fourths of an inch deep, and drop in the carrot seed. Then, by shoving a common hoe, lengthwise of the furrow, cover the seeds, and, in that state leave them to take their chance, only taking care not to entirely destroy them, until the peas have arrived at maturity, and are fit to gather .-At this time clear off the brush and vines, and if convenient plough between the rows with a horse. Hoc, clear out the weeds, and thin the plants to a proper distance. At this time they will appear small and meagre, but will soon change their appearance. By this method I have raised fine carrots at little expense, on the same ground ou which I raise my peas, I believe sometimes being equal in value to the crop of peas; and have my ground in a much better situation for a crop the next season, than if left for the weeds to grow and bear seed after the peas are ripe, as is the practice with JOHN MACOMBER.

Westport, 2d mo, 1829.

Pride is as loud a beggar as want, and a great deal more saucy .- Sarille.

An Initiatory Discourse, delivered at Geneva, 27th November, 1828, before an assembly, from which, on that day, was formed the Domestic Horticultural Society of the western parts of the state of New York. By MYRON HOLLEY, Esq.

Friends and Fellow Citizens:

The impulse which has brought together, at this place, so intelligent and respectable an assembly, affords a happy omen for the institution here intended to be formed. We are now making the first attempt, in this vicinity, to associate numbers in the work of informing, refining and extending a taste for horticulture. And, while it is natural for all of us who delight in the beautiful and useful productions of the garden, and the orchard, to rejoice in this public manifestation of favor for the cultivation of them, it may be both agreeable and appropriate to introduce the more specific business of this address, by some references to the past.

Forty years ago the country which we now occupy in such full and secure enjoyment, presented a widely different scene. Then, the wealth of nature, so profusely lavished upon this goodly region, lay all secluded and unvalued. In vain our plains teemed with fertility, our streams rippled over their declivities, and our lakes stretched their beautiful surfaces along the most safe and accessible shores. The rude and unbroken forest; the wild and lonely waters, covered and concealed everything, and the whole land was shared by the deer, the bear, the wolf, and the panther, with the savage man, who hunted, and fished, and fought, and suffered in it, but who could not properly be deemed either to possess, or to enjoy it.

The Fathers of the Genessee Country are not yet mentioned with the same emphatic respect which accompanies every allusion to the venerable pilgrims of Plymouth; but by their high practical virtues, by their brave enterprise, their undergoing fortitude, and their prevailing faith, they proved themselves to be truly derived from the same stock.

Since the date of their bold advance into the wilderness, we have become so familiar with new settlements growing prosperously and secure, that all the soft enjoyments of life, which they must necessarily have entertained. For, since that period, what transformations have we witnessed !-How far beyond us the tide of cultivated population has flowed! How many new and powerful states have been founded, in place of the gloomy woods, and their fierce possessors! Theu, the Indian title to our country was first extinguished, though it still remained in full and acknowledged force, to an extensive territory between us and the nearest limits of civilization. Then, a foreign nation, recently at war with ours, was in possession of all the military posts within our limits, as well as its own, upon our northern frontier; where it kept strong garrisons, and maintained an intercourse with the Indian tribes which inflamed their barbarous propensities towards our citizens. And the Indians themselves, having been arrayed on the side of our enemy, in the same war, and having seen their crops destroyed, their orchards tial comforts, and many of the elegancies of life, cut down, and their dwellings given to the flames by our successful soldiery, were unusually prone to vengeance. Then, too, our own government was not able to interpose the ample shield of its estab- an institution would increase our own enjoyment bished power, for the protection of the dissevered of one of the most appropriate and delightful of settlements of its remote interior; for it was tot- human occupations, we gave the notice which has tering with debility, and showed frightful symp- been the occasion of this assembly.

toms of dissolution under the old confederation. Such were some of the repulsive circumstances under which the small band of our adventurous predecessors, in the fall of 1788, and, in this very life, which, by so many and such vigorous branchwhat unshrinking resolution, with what bold hope, did they sustain themselves! The character of their undertaking, in their own estimate, included much privation and personal hazard. These they met with wary prudence and manly firmness .-Continual and unmitigated labor they expected,

and cheerfully encountered. They were often subjected to hunger without food; to sickness without the aid of nurse or physician, and to bloodshed from the savage. But they had great teemed useful and desirable since. And it is proband beneficent objects, and they succeeded. The able that Adam, after he was sent forth from the civil and social good which they intended, is made garden of Eden, to till the ground, and had sought certain. And though they had to struggle much, and to endure much, they also enjoyed much.

No associations among men create stronger ties of friendly regard than those which necessarily nearly the uniform inheritance of his children. exist between the first adventurers into new and dangerous settlements. And the sincerity and constancy of this regard, in respect to real enjoyment, often makes up, and more than makes up, for all the loss of ease, and luxury, and formal courtesy, which are usually found in long established, populous, and wealthy communities. This was eminently the joy of our predecessors. But this was not all their joy. Their spirits were perpetually refreshed by glowing anticipations of the future. They knew the importance of their exertions. They labored, and suffered, in perfect assurance that they were laying the foundation of the great blessings which we enjoy, and of yet greater blessings to come. And like affectionate Fathers, they rejoiced in the foreseen joy of their ture was far advanced. Moses himself, in setting descendants.

And now, if in the land of their hopes, their trials, and their toils, the most useful and creative arts have set up their dominion, and are already exhibiting their most desirable trophies: if Agriculture has placed her axes, her ploughs, and her we can hardly estimate the disregard of ease, and flails into the strongest hands for our advancement, and made the fertility of our plains to fill innumerable granaries: if Manufacture, with her wheels, her lathes, and her spindles, has already peopled the banks of our streams, and is rapidly drawing all the weight of their waters into our service: if Internal Trade, with her hosts of active, clear-sighted, and diligent agents, is filling our lakes with her various and ingenious craft: Then, while with devoted homage, and pions gratitude. we ascribe the praise and glory of these results to our Heavenly Father, let us also often recall, to the most respectful memory, the distinguished men who first opened the great theatre on which mon, the wisest of men is addressed as having a they are displayed.

Holding such views of the character and deserts of those who have gone before us, and desiring the continued advancement of the country which they left us, so exuberant in the bounties of physical nature, and so replete with all the substansome of us have supposed that a Horticultural Society might be rendered one of the means of its further improvement. And, conscious that such

Horticulture is the most ancient of the useful arts. It was the great employment assigned to man by his omniscient Creator, before guilt had invaded his heart, or sorrow had wrinkled his spot, first planted that broad and spreading tree of brow. In the first freshness of the world, as it was called into being, clothed with every ornament es, now adorns and gladdens the land. With of which it was susceptible, when every herb and tree that grew upon it, every bird that flew in its air, every fish that swam in its waters, and every animal that walked upon its earth, was pronounced, by perfect Wisdom, to be "very good,"-then a Garden was the crown of its attractions, and "to dress it, and to keep it," was an employment worthy of its only rational inhabitants.

> An employment suitable to the pure enjoyments of Paradise before the fall, has always been esto regain the favor of his Maker by repentance and submission, still cherished a fond attachment to it. It is certain that a taste for it has been For, in every age, those nations which have been most conspicuous for knowledge, and power, and refinement, have been most remarkable for their love of Horticulture.

> During their Egyptian bondage the Jews were accustomed to an abundance of garden vegetables: for, in the book of Numbers, we find them in the wilderness, complaining for the want of "the cucumbers, and the melons, and the leeks, and the onions, and the garlicks," which they were wont to eat in Egypt. If the Jews, in their servitude, were habituated to the enjoyment of these articles. which have always been among the most prized garden esculents in warm climates, we may reasonably infer that the state of Egyptian Horticulforth the attractions of the land of Canaan, for the purpose of more effectually exciting his nation to obey God, represents it as producing vines, fig trees, and pomegranates, plants of the garden; as well as wheat, barley, oil, and honey. And he directs, that, when they shall have planted all manner of trees, for food, they shall not partake of their fruits until the fifth year, the fruits of the fourth year being devoted to the Lord, and the earlier fruits not being permitted to ripen; doubtless for the benefit of the trees.

> In later times the Jews are represented, in the scriptures, as having delighted themselves with cating in gardens, under howers and shady places. And the most striking images by which they expressed a state of great national security and prosperity, are drawn from a garden, where every one ate and drank, under his own vine and fig tree, with none to molest him. In the Song of Solothousand vineyards, with two hundred persons to keep their fruits; and as dwelling in the gardens. In the first book of Chronicles, those who wrought fine linen, and potters employed by the king, are mentioned as having lodged in his gardens.

To be continued.

Fecundity of Rats .- Rats multiply so prodigiously, that were it not that they are universally a proscribed animal, and receive quarter from neither man nor beast, nor even from one another. it is calculated the world itself could not contain them. From one pair, 1,000,000 may be propagated in two years. Vide Buffon, Querhoent,

From the New York Gardener.

IMPORTANCE OF KITCHEN GARDENS. " As the spring will now soon open, and call us to commence making provision for another winter, it may not be amiss to invite the attention of tance, both in a useful and economical sense. I mean the cultivation of a kitchen garden. There is no need of inviting the attention of such as cultivate a garden, either for ornament or profit; their pleasure or their gain will not permit them face of the ground, and a bank should be thrown to be negligent. But the great mass of citizens up upon each side, to fill the space. Or, if you do certainly deprive themselves of much convenience, saving, and perhaps health, by not possessing a liberal supply of vegetables from their own gardens. To a farmer or mechanic in the country, the expense of cultivation is trifling; the convenience and saving, especially during the long and a half feet long, and sawed an inch and a half winters of our climate, are great.

dissuaded from constant attempts in cultivating a never be a failure of vegetables enough for a family's use, if the following requisites be well regarded :- Richness of soil; due care in the selection of seeds; proper cultivation; and a sufficient variety of vegetables, that if one kind fails, another

may be a substitute.

"It is a general complaint among persons who pay only little attention to their garden, that the seed often fail. This usually happens because two feet long. due care is not taken in discriminating between ripe and unripe seed; between blighted and sound seed. Or in some cases it happens by using old seed instead of fresh. Onion seed is often useless after the first year; and parsnip seed is so delicate that I believe we can place no confidence in its vegetating principle after having been kept a year. Having generally purchased these more delicate seeds annually, of professed seedsmen, I have rarely failed in any planting. The expense is indeed something, but it is overbalanced by the certainty of a growth.

" But our gardens do not generally present variety enough to be profitable and convenient to the owner, throughout the whole year, even if all the planting succeeds. There is frequently no provision for the winter, and many a long month, when the vegetable kingdom is locked in frost, is passed with no variety on our tables, to excite the languid appetite, or satisfy that which is pleased with rotation. But surely it is as easy to store our cellars with the beet, the carrot, the onion, the parsnip, and vegetable oyster, as with the dull monotony of the potato; and however nutritious the potato of other productions of the garden.

"We do not invite the plough boy from the utility of his farm, to the pleasures of a garden; we do not wish him to sacrifice his grain fields to they have grown here a year or two, they should the culture of a tulip bed; but we wish to call his be removed to the plantation as soon as the frost attention to the utility, convenience, and economy is out of the ground in the spring, or in the authat can be found in the cultivation of a substantial kitchen garden, from which his healthful family can draw many of those really innocent luxuries, which a bountiful Providence has, with so lavish a hand, spread around him."

The above remarks from the Albany Ploughboy well deserve your attention. Let them be imform your horticultural text-book.

should be completed. Have you brought home the materials? If your fence is to be made of wood, now make ready the posts; they should be large, if you wish them to stand firm and durable. They must be seven feet long, and placed two the plough boys especially, to a subject of impor- feet into the earth. If they are set only ten feet apart, the girts or rails may be an inch and a half thick, and if they are well framed into the posts, will make a strong inclosure. The lowermost girt must be placed sixteen inches from the surhave stone upon the farm, make a wall three feet high; let the foundation be laid six inches below the surface; and in the centre of this wall put small posts, into which the girts must be framed. The posts for a fence of this sort, should be five thick, six inches wide at the foot, and four at the "Many persons, sensible of the utility, are often top. About a foot and a half from the bottom, make a two inch hole, which should be filled with kitchen garden, because they have experienced a piece of good timber, two feet long. This will some failures in particular plants. But there will greatly strengthen the position of the posts, without weakening the wall. Ahove the wall, two girts, the one eight, and the other six inches wide, will be amply sufficient. Take care that your wall is laid with art, and that the timber is well fitted to it, and I will insure safety to whatever you may plant in the garden. Or, if you fear depredation from hens, let the girts be perforated with inch holes, and place in them turned pickets,

> You will need two gates, one of ten feet wide, to admit the cart, and another of three feet for daily use. This should turn with ease, and must liable to much vexation and loss, from careless-

Your fence finished, select a proper place for the small kind of fruit shrubs, as gooseberries, currants, and raspberries; for although you admit no trees within this inclosure, these useful shrubs must have a place. They should not be planted around the fences, nor through the centre of the garden, as is too commonly the practice, but in a continued plantation, that they may have suitable attention, and yet not obstruct the plough.

Gooseberries require a deep and rich soil. The ground between the rows must be well manured, and kept free from weeds, and you should be careful to plant none but those that are of a good

A good mode of propagating gooseherries, is by cuttings or layers. For cuttings, take shoots of the last years growth, from shrubs that are known to hear choice fruit. Let them be at least ten be, still its utility cannot be hostile to the claims inches long; cut off all the buds, except three or four at the tops, and insert the stem six or eight inches into the earth; tread the ground firmly around, and keep them free from weeds. When tumn, which is, particularly for the gooseberry, the best season.

Currants may be propagated in the same way. They are, however, more hardy, and do not require so rich a soil. They should be placed in rows, six or eight feet apart, and kept free from weeds. Between these rows, you may raise a pressed upon the tablets of your memory, and crop of dwarf or bush beans, (taking care that there are no runners, or vines among them) with- down to one plant,) and cover them about one

Before the end of this month, your inclosures out the least injury to the shrubs, for several years.

There is great choice in currants, as well as in other fruit; select only the large red and white current, for no art will change the original nature of the fruit, although by skilful cultivation, the quality may be improved.

The gooseberry and the currant both claim the farmer's attention, and are much wanted in every family. They furnish a cheap and early sauce, and the latter a wine equal to the best Liebon or Teneriffe.

As you will doubtless wish to plant other trees, and be desirous to know the hest season for that work, I would observe as a general rule, that all kinds of trees or shrubs, should be moved or set in the spring, as soon, at least, as the buds begin to swell. The apple tree, the cherry, and plum, will grow, if set with art, when the leaves begin to open, but not with health and vigor.

ON THE CULTIVATION OF BEETS. By the Editor of the Southern Agriculturist.

(Concluded from page 250.)

The remarks made above respecting the forking of Beets, principally apply to the Long-rooted varieties. The Turnip-rooted (so called from its resemblance to the Turnip, in shape,) sends down a small root in search of food, and like the Turnip forms a bulb near the surface of the ground, there is, therefore, very little to he feared from its forming ill shaped roots, by an improper application of manure. Although we have been successful in beds, yet we prefer planting on ridgelets, which is done by making deep furrows with the spade every twelve or eighteen inches, spreading the manure be effectually secured by a weight, or you will be in the bottom, and forming small ridges above them. There are several reasons in favor of this plan. 1st. Less manure is required, which very often, among our farmers, is a matter of some consideration. 2d. Fresh manure can be applied .-3d. The forking of the roots, is, in some measure, if not altogether ohviated. And 4th. The roots can more readily expand than when sown on the level ground, where, in order that they may enlarge, the earth around them, must be pressed into a smaller space. The principal objection against this plan is, that in time of droughts, the plants suffer more than when on a level surface, but, we think, that the advantages are greater than the disadvantage, and therefore recommend the ridge system, especially if the ground be inclined to clay. I knew a gentleman, who could never raise beets, until he adopted this method, and afterwards he had very fine roots, and found no difficulty. In manuring we have used salt mud alone, with great success, spreading it along in the drills as recommended above; this mud is such as is usually found at the head of salt water creeks, having a little more of vegetable matter than that of the marshes, but fully as salt, being overflowed every tide. We prefer having a compost made of it with stable or other manure, which we think produces roots of as great size, and decidedly of a much finer flavor, than they are, when raised on manure alone, especially where an excess of manure has been used.

About the middle of January, or beginning of February, [March or April in the Northern States] the first crop may be planted; the ground being prepared, commence by dropping two or three seeds every nine inches, (to be afterwards thinned

inch deep. Should the weather be cold they will It does not appear to us that the occasion called as we usually have, a spell of very mild, warm weather, the plants will show themselves in the course of ten or fifteen days. At this early stage, they are very tender, and should there be a frost they may be all killed, they therefore should be protected, if this be likely to occur, by some slight covering. This need not be applied after they have advanced a little in their growth, as they then become extremely hardy. We have seen every leaf, except the heart-leaves on the plants, killed, and the beets, as soon after as the temperature of the weather permitted, again sending out fresh leaves, and these plants afterwards produced very fine and large roots. The young plants should receive an early hoeing and earthing up, for they send up a part of their root above the surface of the ground, when they first come through, which being very tender, is soon injured by the wind twirling the plants around, and the sand blowing against them. If they are examined, they will be found very often unable to support themselves, and resting on the ground the onter parts of the root, entirely destroyed, and nothing but the woody fibres remaining; and these very often reduced to mere threads. We have seen them often completely severed, and the tops with their leaves laying on the ground near the remaining part of the plant. Before we had noticed this, we lost many, and gave the grub worms the credit of destroying them; but, although the worms will destroy some, yet the wind will destroy many more, if they are not protected. This is done by earthing them up so high as to leave merely the heart leaves uncovered; it must not be neglected by those who wish to have regular and well filled beds, and must be attended to early, or there will be little gained by it. The other part of the culture is simple enough; they must be kept clean from grass, and the earth mellow around them. If sown in January, they will, in all probability, be fit for use in May. Any time from the middle of January until May, beets may be sown, but the late crops are not likely to be either so large or productive, owing to the extreme heat, and very often drought, which prevails during that season of the year.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 6, 1829.

HORTICULTURAL SOCIETY.

It is the design of the promoters of this contemplated institution, to invite a general cooperation of their fellow citizens, throughout the State .-Such as are disposed to become members, may signify their intention through the medium of some friend, (if a personal application is inconvenient,) or by letter, postage paid, to Mr J. B. Russell, publisher of the New England Farmer, or to the subscriber, Secretary of the previous meeting.

Boston, March 2d, 1829. ZEB. COOK, Jr.

Fire.—The Green House and work-shop, of Mr Jacob Tidd, of Roxbury, were consumed by fire, about half past one o'clock, of the 24th ult. Mr Tidd lost nearly all his farming tools, but not many valuable plants. It is not known how the fire originated, which first broke out in the shop.-Loss about \$600.

the Essex Agricultural Society has been received. ticle of diet.

lay dormant, but should there be about that time, for the display of so much energy of animadversion as the writer has exhibited; and we are not prepared to second all his sentiments. We will, however, permit his remarks to appear in our

> Woodland on a Farm-An estate without timber may be compared to a house without furniture.

On carrying live Poultry to Market .- An English writer remarks that "death is scarcely a misfortune to an animal which has no previous apprehension of it. But poultry carried in bags or baskets to market has several hours previous suffering, and the burthen and trouble of carrying them thither seems much increased thereby." We believe live poultry is seldom seen in American markets.

Husbandmen and Manufactures .- Flourishing manufactures increase population, not only by the increased number of workmen employed, but also by adding to the number of husbandmen employed in the cultivation of the neighboring land.

Land and Capital .- In a new country it is an object of inquiry, how much land can be cultivated to advantage with a given capital. But as population increases, and land becomes comparatively dear, the question arises, on how small a quantity of land can a given capital be profitably employed? It is in this latter state of a country that agriculture attains its greatest perfection.

Feeding Cattle with Turnips .-- American writers on agriculture have often expressed their opinions that the culture of roots for feeding cattle, was less advisable in this country than in England, because our winters were so severe that they could not be drawn in the winter, and fed out in-the fields where they grow; as they may be in England. But an English cultivator, whose observations are published in the appendix to "Plymley's Survey of Shropshire" says "I think it much more advantageous to carry all the turnips to cattle in stalls than to feed them out on the land, because they furnish much more food and manure.3

Cows fattened easier, and better Laborers than Oren .- The same writer above quoted says " I think cows are much more useful and beneficial than oxen, and that it would be an advantage to the kingdom if few or no oxen were reared. The uses of cattle are to work, milk, and feed. I have seen harren cows work as well as oxen; they require less keep and walk faster. Oxen are of no use in the dairy, and they will not feed [fatten] so fast as cows.

When first I commenced farmer, I followed the example of my predecessor in feeding chiefly oxen; but I soon found that cows fed much faster and on less meat, and for some years past have carefully avoided having any oxen in my stalls.

The projected rail road, between Alhany and Schenectady, is to be commenced early this spring. A route has now been agreed upon, and the surveys completed and accepted.

Strawberry.-The common strawberry in a ripe state makes a most excellent dentifrice, sweetening the breath and preserving the gums. It is said that the celebrated Linnæus cured himself of beginning. Enter at "the little end of the horn," An able article on the Report of a Committee of gout by a persevering use of strawberries as an ar-

WORKING OXEN.

Much has been said and written against the common mode of working oxen with a yoke. This manner of attaching them to their load is said to be the principal cause of their moving with a slow pace. When oxen are attached to a cart, with a stiff, heavy tongue, according to the New England mode, it is often the case that the load is so disposed in the cart that it bears heavily on their necks, and is very oppressive, especially in going down hill. And sometimes in going up hill the tongue of the cart has a tendency to rise, in consequence of the preponderance of the part of the load which is behind the wheels, and the oxen are nearly choked by the bows of their vokes being drawn against their throats.

In France, working oxen are harnessed by the heads in such a manner as to call into action the joint power of the neck and the base of the horn. This method was some years since, introduced into Ireland with complete success; two oxen thus harnessed, according to English accounts, were able to draw with ease, three tons weight.

Mr Cooper (Young's Eastern Tour) uses collars on oxen as on horses, except that they are buckled on with the narrow end open end downward: the chains are fastened to them in the same direction as on a horse harness, the draught is therefore more inclined than with horses, the line of the chains being almost up to their backs; which is necessary from the different shape of horses and oxen. They draw when in harness abreast in pairs; single or in a line, and walk as fast as horses. Mr Bordley says he "saw a wagon in Pennsylvania, drawn by two bulls and two oxen, bridled and geered in harness and collars."

In Plymley's Survey of Shropshire, it is stated that "The ox teams of this county used to consist of ten oxen yoked: now those who use them generally plough with five oxen single in geering. or with four oxen and a horse to lead them. A few persons have used them in wagons," And the same work mentions a team, in which "one ox shafted the wagon, and I believe this team, either in ploughing, or upon the road, was as able as any horse team in the neighborhood,"

The improvements made at Baltimore, in the construction of railway cars, are exceedingly promising. A Mr Knight has invented a carriage by which "a load weighing 1300 lbs. was drawn backwards and forwards, on a level railway with perfect ease by a single thread of sewing cotton. A second experiment was then made in the following manner: ten fifty-sixes were placed in the car, seven gentlemen being placed in it, whose united weight was estimated at 1000 lbs., which, together with that of the car, 200 lbs., made a total of 1760 lbs.; a half pound weight was then placed at the end of the thread, suspended over the pulley, when, to the surprise of all present, the car moved off, unaided by any other power, and passed to the end of the rail with the utmost facility .- Penn. Gaz.

Spend prudently .- What folly lays out in kidskingloves, in ten years, managed by prudence, might fill a small purse. Are not white dollars worth more to a farmer than white hands? If your finances are small, be not ambitious of owning a three story house. A humble cottage is a good and you may see at the other an elegant house large enough for a thrifty farmer,

BARTLETT PEAR.

· This pear weighs about 10 ounces when at full size, shaped like a Bon Chretien, very yellow, and slightly tinged with red on one side; quite juicy, and by many considered a first rate fruit. It is not, however, equal in flavor to the Seckel, or even to the Boston Epergne, but its size and beauty render it greatly admired. It much resembles in flavor and consistence the St Michael, and is said to command a high price at market. It is no doubt a native, and appears to have originated in the vicinity of Boston; and it does not seem a tall strange that many fine new pears should have originated there, as that city, and its environs, has for a long period been inhabited by a great nany gentlemen extremely intelligent on the subject of horticulture, who took much pains, at an early date, to introduce the choicest fruits, and particularly the finest varieties of pears, of the control of the subject of horticulture, who took much pains, at an early date, to introduce the choicest fruits, and particularly the finest varieties of pears, of the subject of horticulture, who took much pains, at an early date, to introduce the choicest fruits, and particularly the finest varieties of pears, of the subject of horticulture, who took much pains. nated in the vicinity of Boston; and it does not which fruit they are skilful connoisseurs.—Prince Strawberry Tree. on Horticulture.

The Paragon of Jokes .- " Pray," said Lutterell to Sam Rogers, the other day, "what is the best joke you ever saw in print?" "Why," said the English Norbury, "it was an advertisement in the Herald from the commissioners of the sinking fund, returning thanks for a donation of six pounds towards paying off the national debt."

The only way for a rich man to be healthy is by exercise and abstinence; to live as if he were poor, which are esteemed the worst parts of poverty .- Sir W. Temple.

Scotch Gooseberry Bushes and Hawthorns. This day received at the New England Farmer Seed Stire, from Greenock, Scotland, 15000 Hawthorn Quicks for Hedges, and 1000 Large Scotch Ginseberry Bushes, in fine order.— Further particulars next week.

CARD. The subscriber returns his thanks to the Committee of Essex Agricultural Society to view farms offered mittee on Lasex Agricultural Society to view farms offered for inspection and premium, (through the medium of the New England Farmer, and would thank the gentlemen Editors to copy this who reprint the report of said Com-mittee contained in the New England Farmer of February 27th,) for their kind notice of what they term his "ex periments," and fur their prudence in not recommending to their brethren that kind of farming calculated for "display," without regard to "cost," and would merely observe it was as tavorable notice as he expected after his treatment at the Society's Cattle Show and Ploughing Match-which treatment prevented his furnishing the statement they say they had not received, as the prejudice statement they say they had not reterven; as the prijourned then manifested was evident to those disinterested: he would however observe that he shall, "the opinion of the Committee to the contrary notwithstanding," CONTINUE he Scotch method of Ferming which he has followed fifteen years by performing his work with horses, &c, though dubbed experimental and for display by said Committee—where he shall be happy to have the farm examined by any one having a taste for agriculture, and even those who can make more disptay in writing a report than in cultivating a field. Indian Hill Farm, West Newbury, (Mass.) March 2.

Mill Privilege, &c, for sale.

For sale in West Cambridge, six miles from Boston, a valuable Mill Privilege, with about one acre and a half of land, with the buildings now standing thereon, consisting of a good dwelling house, two factory buildings very conveniently built, and other out buildings, and would answer well for a fulling mill, (one being in operation now.) or carding factory; and being situated on a good stream of water, would prove a valuable situation for any similar business. It has been heretofore used as a carding lactory, the machines for which are now on the spot, and will be sold if desired, with the buildings. An indisputable title will be given, and payment made easy. Apply to Thomas Russell, West Cambridge, Captain Abner STEARNS, Bedford, or J. B. RUSSELL, New England Farmer Seed Store, 52 North Market street, Boston.—It will be sold at auction, April 1, if not previously disposed March 6

MISCELLANIES.

THE FARMER'S SONG.

Away with grandeur, pomp, and gold : Away with childish ease Give me but strength my plough to hold, And I'll find means to please.

'Tis sweet to toil for those we love; My wife and darling boys, Both tend to make my labor prove The sweetest of my joys.

The humble morsel I procure, When labor makes it sweet, Is eaten with a taste more pure Than meats that monarchs eat.

'Tis mine-yes, 'tis my happy lot, From cares and avarice free, To own but this secladed cot. Sweet friends and liberty.

Thus I no monarch on the throne Can grudge his destioy, Let him his weight of care bemoan, Whilst I am truly free.

When labor wearies and grows dull, I with my dog-and gun, Set forth, the finest game to cull, And thus all sorrows shun.

Now tell me, all ye gouty train, Who have what fortune gives; Is not the cheerful country swain The happiest man that lives,

LAMENT FOR BURNS.

BY T. GRAHAM. Air, Highland Watch.

Ye heath-clad hills, ye sparkling rills, Deep glens and flow'ry plains, To you, no more, your bard shall pour His soul-enchanting strains. Ah! Bonny Doon, no more he'll tune, His infant lays to you, Where genius bright, enthroned in light, Her mantle o'er him threw.

While Freedom's fire flash'd on his lyre To blast the tyrant foul, And glory's rays beam'd o'er his lays To fire the warlike soul; Twas when its strings caught faney's wiogs, To waft each witching strain, With cupid's dart, to ev'ry heart, And fleet o'er ev'ry scene.

But flowing Clyde, thy silver tide May gild thy valleys green, No more again his melting strain He'll pour to Bonny Jean. . Ayr's gentle wave, no more he 'll lave O'er holiest vows of lave, While Mary's charms blosh'd in his arms, And Heaven smiled above.

But nature's lore, still, still shall pour, In strains her minstrel seng, Though with him laid in death's cold shade, His hallow'd lyre unstrong; For dark decay, the deathless lay Thy dull dominion spurns, While time shall roll, 't will charm the soul, And sound the fame of BURNS !

INFLUENCE AND EDUCATION OF FEMALES.

If at any time any improper discourse should he addressed to young ladies, which has a tendeney to indecency, immorality, or irreligion, they should be taught to express a marked disapprobation both in words and countenance. So great is the power of the softer sex in meliorating the characters of men, that if such was their uniform behaviour, I doubt not but that it would much contribute to reform the morals of the age.

Dr Darwin says that young ladies who continue at school to a later age "should be formed into a class and properly instructed in domestic economy, each of them superintending the business of the family a week, or a month, by turns; not only providing for the table and directing the cookery, but they should also be taught other parts of domestic employments, as cutting out linens, and making them up with plain and strong needle-work, either for their own families, or to be given for clothing for necessitous infants and mothers."

The art of economising and rendering all kinds of food as palatable and nourishing as possible, by different modes of cookery, will repay the mistress of a household for the investigation, and should indisputably form a part of the regular instruction of young females. To this, as they advance towards maturity, may profitably be added the knowledge of the value of all the necessary articles consumed in the family, whether for the table or the wardrobe, as well as the quantities of each which are requisite for their respective uses. As theory is of little avail unless exemplified by practice, they should be habituated to fill the department of housekeeper, under the inspection of their mother, not only by purchasing the different courmodities wanted for the use of a family, but like wise by keeping an exact account of the domestic expenses, which will afford opportunities of teaching them a judicious application of money, and giving them distinct ideas, where frugality may be properly exerted, and where greater latitude may be allowed.

In educating a young woman, care should be taken not to raise her expectations above her rank and fortune; for many have paid dearly for having aspired too high; and what would otherwise have rendered them happy, became disgusting through looking up to a superior station in life.

As the late king of Prussia was one day reviewing his troops, he observed a soldier, who had his face much disfigured with scars ;-he walked up to him, and asked him in what public house be got those scars? To which the soldier replied, "Please your Majesty, it was at a place near Machsen,* where your Majesty paid the reckoning." The king was pleased with the reply, and gave the soldier a Lieutenant's commission.

LIBERTY.

Some time since, 15 or 20 negroes were driven through Washington city in chains towards their place of destination. As the drove passed along before the driver through the street, some gentlemen, members of Congress, stood at the gate of nen, nembers of Congress, stood at the gate of see capitol, looking at them. One large negroe alked out from among the others towards the entlemen, stopped a moment raised bis hands, *A town in Silesia, near which the king lost a great battle.

*A town in Silesia, near which the king lost a great battle. the capitol, looking at them. One large negro walked out from among the others towards the gentlemen, stopped a moment, raised bis hands,

shook his chains, then, after a short pause, while his hands were raised towards heaven, began the freeman's song-" Hail Columbia, happy land."

Some time ago, Dean B-, who was a very exemplary and popular clergyman in Dublin, and who interested himself much in public charities, sent a message to Miss Catley, an actress at the Dublin Theatre, requesting her, to give him a night for that purpose, in one of the public gardens. Miss Catley, who found from the variety of her engagements, that she could not comply, pretended to understand him in a different light, and in consequence, wrote him a note, of which the following is a copy.

" Miss Catley presents her compliments to Dean B-, and acquaints him, from the nature of her present connexion, she cannot (agreeable to his request) give the Dean a night. She begs leave at the same time, to acquaint him, should this connexion be dissolved, she does not know any gentleman of the cloth, she would sooner indulge; but hopes that decency will prevent the Dean from fixing on a public garden for the rendezvous."

Requisites .- There are five requisites for a professed drunkard :- a face of Brass-nerves of Steel-lungs of Leather-heart of Stone-and an incombustible Liver.

Farmer Wanted.

A faithful man is wanted to take charge of a small place in Roxbury, comprising a garden, orchard, &c.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

REMARKS ON THE REPORT OF THE COMMITTEE OF THE ESSEX AG-RICULTURAL SOCIETY.

MR EDITOR-I have read in the New England Farmer of this week the report of a Committee of the Essex Agricultural Society, who were appointed to examine the farms in the county, proposed for premiums; and who have here given the result of such examination, I have no per sonal interest whatever in this matter; but as a public paper, I consider it open to remark, and think that it should not pass without notice .- Reports of the committees of all public bodies, should, in my humble opinion, be grave papers, based exclusively on facts; and not vehicles for rhetorical flourishes, for wit, or "what looks like it." 1

The report seems to me, in the first place, very deficient in those exact statements of which it ought to be composed. The Committee speak of the remarkable improvements of some farms, but do not give a sufficiently particular account of what these improvements consist in; and tell of the extraordinary produce of some of the farms, but furnish very few items as to the nature or amount of the crops. These things should be minutely specified by one who proposes his farm for award that premium. We ought not to be satisfied with generalities; we want particulars. Every careful farmer should keep an exact account of his crops, and the amount of labor expended at them; otherwise it is difficult to form a correct judgment of his skill or success. 2

I protest in the next place in the report to a want of delicacy, and a violation of propriety, in the remarks of the Committee concerning the lady of one of the successful competitors, whom they have extravagantly complimented. This paragraph, must, I think, have been penned by some forlorn bachelor, or widower, in the Committee, if there is any such one, who seems to have been awakened to a sense of his melancholy condition. I dare say the lady in question deserves all these encomiums. I have not the pleasure to know her, Be this, however, as it may, Mr Editor, if a committee should visit my farm for the purpose of inspecting it, and should see fit to make my modest and good wife the subject of such fulsome panegyric in the newspapers, I will not say I should feel myself insulted, because I dare say their intentions are well enough; but I should be much hurt, and am persuaded it must be very offensive to a sensitive and diffident woman. Our manners in this respect have already become quite indelicate and ridiculous. What is cheaper than news paper adulation? It is offensive enough to ourselves; but when our wives are to be made its

subjects, and to be talked of in the same report by; at least from individuals, some of whom can with our domestic cattle and swine, it should be have had little practical concern with agriculture spoken of as it deserves, 3

low prejudices, which the report seems to me to been betrayed into too much warmth. I intend exhibit. The Committee speak of visiting a farm no disrespect to the Committee; nor do I come at West Newbury; and after some left-hand com- forward as the advocate of the West Newbury pliments to the tenant, and admitting that the re- farmer, with whom I have no connexion whatsult of the improvements there introduced cannot ever, and no acquaintance than that of having ocbe at present determined, they go on with some casionally vis. ed his farm. I feel, however, that most uncandid and unwarrantable remarks as to I owe an apology to him for thus bringing his gentlemen being at liberty to farm for display and name before the public. But, sir, I thought the to include in their fancies for dogs and horses; covert attack pon this gentleman ungenerous, and then they prate about innovations upon Yen- and do extremely dislike any want of liberality kee husbandry. This is unworthy of them. The and candor towards industrious and intelligent forgentleman who occupies this farm at West New- eigners, who settle among us, and who are cerbury, is a foreigner, recently come among us.-Every caudid man will admit that he is much their methods serve no purpose but to evince the more of a practical than a theoretical farmer; and superiority of our own. We talk as though the thoroughly skilled in the best methods of Scotch meridian sun was shining upon us, when as yet in husbandry. He is a working farmer; and can do regard to agriculture, as well as many other of as much, and I apprehend does as much of every the practical arts, it is scarcely day-dawning; and

bandry of the most improved districts in Scotland; reprobation. and the Scotch farmers are universally acknowledged to be second to none in the world. We against what are termed gentlemen farmers: these have seen this man's skill in sowing and ploughing, and various operations of husbandry with admiration. We believe and his neighbors admia premium, and hy a committee, who undertake to the fact, that there is no farm in the vicinity in all the agricultural improvements, which have where more effective labor has been done by the been effected. I ask, with no small confidence, same number of hands, or a greater produce raised to whom and the farmers of Essex more indebtin proportion to the expense and the facilities, ed than to the late Col. Pickering; and the county which were afforded. Without having ever seen of Worces of then to our present chief magis-indian corn cultivated, he produced as good and trate? Who have done more for the agricultuas well cleaned a crop, the condition of the land ral interests of Virginia than Washington, Tayand the amount of manure used being considered, lor, Jefferson, and Madison? Who for Pennsylas has been grown in the county. We think he vania than Peters, and Mease, and Powel? Who has much to learn in regard to the nature of our for New York than Armstrong, and Featherstonclimate, and other circumstances of the country, haugh, and Buel? Who have done more for the and to adapt his cultivation to them. We believe interests of practical agriculture in Massachusetts that he will be compelled for various reasons to than Lowell, and Quincy, and Welles, and Pomabandon some modes of cultivation and manage- roy, and Prince, and Derby, and Parsons, and ment, which are not suited to our country and Sullivan, and Brooks, and their honored associhabits; such for example as the use of horses in- atcs, in present and past years, in the direction of stead of oxen for farm purposes. Yet his experi- the Mass. Agricultural Society; and many other ence in the one case is entitled to as much consid- disinterested and practical, indefatigable, and puberation as ours in the other. But on none of these lie spirited farmers, whom it might be invidious localities, if we may use the term, could we ex- to mention. These are all, in the proper sense pect to find him informed, when as yet he had of the term, gentlemen farmers, many of them hardly been a year in the country. Still whether men of property, and high political and literary his management succeeds or fails, the experiment standing, who have freely given their time, and is certainly conducted with great skill and labor; labor, and money, to advance the agricultural and in either case will afford as much useful in- welfare of the state. It is to the public spirit and struction. Compared with the experience and im- munificence of such men, that we owe in a great provements of Scotch agriculture (the country of measure all our agricultural institutions and im-Sir John Sinclair, and Robert Brown) we are as provements; but had the matter been left with yet in our infancy; and to hold up to ridicule, our common farmers, there can be little doubt what the Committee choose to term "innovations that in agricultural knowledge and improvement, upon Yankee Husbandry," is illiberal; and shows they would have been now, as is exemplified in either a want of knowledge or judgment. If this the case of the Canadian farmers, where their gentleman had done no more than to give us an fathers were "two hundred years ago." 4 example of an Improved Threshing Machine, he would be entitled to the thanks, and most certainly ought to be spared the sneers of the communi-

3 Ladies, however, are awarded premiums at our cattle shows. A good housewife deserves praise as much as her hus-baudman. See Proverbs, chap. xxxi.

in any of its forms.

I object in the last place to the unworthy and. I hope, Mr Pditor, I shall be excused if I have tainly capable of teaching us something, if even kind of farming labor as any man in the county. that self conceit, which would prejudice us against He has managed his farm according to the hus- any and continued improvements is describing of

I am sick, likewise, Mr Editor, of all sneers are the men among ourselves, and in other countries, who by their liberality, experiments, public spirit, and real knowledge, have taken the lead

ESSEX. Feb. 27, 1829.

Notes by the Editor .- 1 This observation is correct, but we

Notes by the Evitor.—I This observation is correct, but we to not perceive that it has any application to the Report in question, in which we can perceive no altempts at wit.

2 Perhaps we may yet be favored with those "exact statements," the want of which is a topic of complaint. The Committee say that "a particular description of them" (viz. the Farnast Woosether with an account of their producious the present farms) "ogether with an account of their productions the present year, will be found in the statements of the several claimants annexed to this report."

⁴ An excellent culogy on gentlemen farmers. We believe, however, that the writers of the "Report" did not mean to be understood as reflecting or saying anything in disparagement of

FOR THE NEW ENGLAND FARMER.

RURAL ECONOMY.

It is among our youthful reminiscences that having a modicum of money in possession we became fruits, would furnish them. anxious to invest it, and finding one ready to relieve us of the burden and to offer us security in exchange, which we deemed by its outward appearance and bulk to be very cheap, we parted with our money, and at our leisure discovered, we had indeed paid too dear for our whistle.

The practice of buying things because they were cheap has grown up with us, and we are, even at a considerably advanced stage of our the fear of our own example before our eyes.

You would not suppose, Mr Editor, that a man who had shivered through forty winters would be so led into temptation by the example of others while smarting under the twinges of past impruprudence loudly admonishes us to desist.

There are some things, sir, that are not so genbut useful, and do not therefore come under our into cultivation, that they may be made common rule of exceptions. We once became the possessor (and still retain it, and value it as a very convenient article in our household establishment,) of your newly invented patent lamp boiler. "Many a time and off" have we with the aid of a small ance with it, for ten years past. I then visited it The tree in my garden, the scion part which is quantity of high wines, performed for ourselves in the fall, found it loaded with fruit; some mid-grafted five feet from the ground with scions from the culinary act, that would in the ordinary way have cost us half its price in fuel, and we have some blasted, and many small ones; I then conthus been regaled with our stewed oysters, independent of the aid of other hands, the exercise of Having repeatedly heard of its selling well in the the inventive genius of our domestic operator .-We believe that no one who has laid out his as many said it resembled it, in flesh and flavor, money for the lamp boiler has ever thought he I looked at it again five years after, at the same paid too dear for his whistle.

But, Mr Editor, we have often laughed in our of roaming through the shaded walks, and admiring the improvements made by a friend of large tree, though frequently the case in small stant bearer, not blasting in the country. Mr ours, in his extensive, and well stocked grounds, ones. Both times I saw the tree it stood in grass HENRY A: DREWS, of Boston, (whose father made to perceive that with all his determination to avoid the evil that is so besetting-he had too unwittingly become the purchaser of a very considerable quantity of what were sold for grape vines, but which in reality were only layers of one year's preparation, and with which our market was inundated the last year. He had taken great pains to set them out, and great care to preserve them alive. But when I saw them in autumn, nearly one-half of them were dry as even wood, and coarse, indented on the top, with a long stem, not would have ignited as freely as ehop sticks, thinks we to ourself, for we did not like to recall unpleasant recollections, you have paid too dear for your whistle, although he bought them cheap.

We would therefore hereby admonish all and singular, to beware of this besetting sin of buying what they do not want, because it is cheap. And market last fall, at four dollars per bushel. It is owners of fine animals, of publishing likenesses of we especially advise those who are already "in the full tide of successful experiment," as was said by a deceased statesman, as well as those who have just embarked in the pleasing employment sembling the weeping willow, a constant bearer, well known. And to breeders it is a saving of of orchardising to beware how they buy a hundred trees, vines, or shrubs, because they are pear; as Mr John Lewis told me, the above pear tance to judge of the merits of an animal, and cheap, when one-tenth of the quantity properly tree sprang from some common button pear seeds, whether adapted to their wants without leaving selected would be worth a cartload with high planted many years since. The plant of this tree their homes.

sounding names-that if they produce fruit at all, growing more vigorous than the others, and showwill produce such as will set their teeth on edge, ing longer and handsomer leaves, induced him to and cool their regard for the delightful employ- let it remain-it has been in bearing twenty years, ment a well ordered garden, of properly selected be has likewise suckers from this tree, which have CAUTION.

FOR THE NEW ENGLAND FARMER.

NATIVE PEARS.

October 31st, 1828, contains an excellent article on fruits, by the Roxbury Farmer, giving an invinishing information of good and fine fruits, partiecan be stated. All readily acknowledge that John Lowell, and S. G. Perkins, Esgrs, have done to every lover of good fruits, than any two individuals in New England.

LEWIS PEAR. The native pear of Mr John Lewis, in Roxbury. I have had some acquainteluded not to take from it any scions in the spring. market, under the name of Roxbury St Germain. the first time, would apply the second. The tree AARON D. WILLIAMS, in Roxbury : there was a fine young pear tree, grafted from the above menit) fair and large size fruit, also bearing the same the year previous-size and form like the old fashlarge round; color of the skin, dark green and ported variety. sightly, flesh whitish, very melting and juicy, as much so as the St Germain was formerly, resembling it also in taste, but not so highly flavored; comes in eating the middle of November, and continues sound until the middle of February, if ealled the Lewis Pear. The tree is vigorous and handsome; branches long, bending in form, re-

come into bearing. Last fall all his trees hung as full of handsome pears as those of Mr WILLIAMS. The land is now under cultivation.

MINOT PEAR - size middling, very fair, not subject to blast, formed something like the Ambrette, MR EDITOR-The New England Farmer of not indented on the top, stem long, skin vellow, flesh white, buttery and juicy, a pleasant and rather sweetish pear, has been in good repute in tation for every one to contribute his mite, in fur- this vicinity but is now on the decline, since hetter fruit is introduced, sells tolerably well, a pretty earthly pilgrimage, and to do the like foolish thing ularly native varieties. I cheerfully join in this good and constant bearer, comes in eating from for which we reprint and our children, not having request, feeling, however, my inability to do the the middle of October to the middle of November. subject justice. I hope every one will feel the We believe this fruit to be a native of Dorchester, force of the above request, by doing as well as as we have its history from undoubted authority. he can; this being one of the great objects for The parent tree of all in the vicinity (which are establishing the Horticultural Society. Few pos- very numerous) is now growing on the old Minot sess the knowledge and power of expressing ideas furm, (so called) and is one hundred and twentydences. But so it is, and we find, our natural so elegantly, and describing fruits so handsoniely five years old. The late Deacon Pierce, who propensity to indulge in buying what we do not as the Roxbury Farmer. But it does not thence was known as a man of strict veracity, was born want, because it is cheap, as strong as ever, while follow that others should say nothing; plain facts and lived near this farm eighty-five years. He has stated many times, that the owner, Mr MINOT, informed him it was a seedling. Mr Pierce likeerally known, or so generally in use as they would more to make known and disseminate the new wise remarked, there had been no perceptible be if they were known, that are not only cheap varieties of fruits from Europe, and bring them change in the size of the tree, for the preceding sixty-five years. Recently I measured it, and found the diameter sixteen inches. It has a good formed head; and stands in a rich soil and well protected. It has the appearance of an old tree, but no strong marks of decay in body or branches. dling large, and pretty fair, more under middling; the original tree, measures twenty-five inches in diameter and has much more the appearance of decay, than the parent tree. I have never heard the history of this tree doubted, during my twenty years' residence in this town.

... Andrews Pear, -sometimes called Amory or GIBSON PEAR, names of succeeding occupants of time of the year; the same remarks that applied the place, in Court street, Boston, from which this pear has been introduced. This most excellent sleeve when we have been indulged the pleasure was entirely too full; this I consider a great fault, variety is now known, and will be largely cultias I never knew any one undertake thinning a vated for its good properties, as a full and conground, under common cultivation. Last fall I us acquainted with this fruit, informed me, it was was in the highly cultivated vegetable fields of Mr removed from Dorchester, between forty and forty-five years since, from which tree others have been cultivated now bearing fruit. The above tioned tree, in full bearing (about three bushels on tree has been dead, ten years, owing to circumstances connected with its unfavorable situation. We should be highly pleased to discover this, a ioned yellow orange pear, rather longer, not so native fruit, but more probably shall find it an im-S. DOWNER.

DRAWINGS OF HORSES.

MR EDITOR-I am pleased to find that the spread in a dry, cool cellar; sold quick in the practice is becoming more common among the a variety worth cultivating, and should, I think, be such as are celebrated. This plan of sending forth multiplied copies of a correct likeness, has its advantages to the owner by making an animal I have strong reasons for believing this a native much time and trouble, enabling those at a dis-

The New Yorkers have found the advantages of it, and have at considerable expense, published likenesses of Duroch, Eclipse, Henry, and some others. These were painted by Mr Fisher, and are correct. I wish I could say as much of the likenesses of Serab and Barcfoot just published in this city.

of the Agricultural Society, or by what spirit the publishers are actuated, I know not; it would seem, however, not to be a spirit of disseminating correct information, for the prints are neither of them likenesses. The one drawn for Scrab is the picture of a fine horse, but certainly nothing of Scrab except his arm-and resembles Barefoot the most of the two, but is a better likeness of Mr Williams' horse Roman than of either. The picture of Barefoot is decidedly bad, and would confirm one in what the picture of Serab would lead him to suspect, that the painter is not, nor ever can be "One of the Fancy." And why the owners of horses who are receiving twenty-five dollars for their services, should employ this person instead of Mr Fisher I cannot conjecture.

A BREEDER. New Bedford, March 5th, 1829.

FOR THE NEW ENGLAND FARMER.

QUERIES RESPECTING FROZEN FEET IN CATTLE.

MR FESSENDEN-I have been a constant reader of your valuable paper for about eighteen months, and among the many remedies recommended for disorders incident to the buman species, as well as the brute creation, I do not recollect having seen anything respecting the freezing of cattle. I believe that it is not an uncommon circumstance for young cattle, especially yearlings, to freeze their feet and legs in the severest nights we experience in New England. Having had the misfortune to have one of my yearlings freeze its hind legs, just above the footlock joint, and not knowing a suitable remedy, I have made bold, for the first time to solicit information from some of your numerous readers, through the medium of your valuable paper.

A YOUNG FARMER. Rindge, N. H. March 2, 1829.

WOODLANDS—QUERY.

· MR EDITOR-Permit me to inquire, through your valuable paper, what method would be best for bringing into grass for grazing, a lot of land covered with oak trees of a large size, the soil of which is good, though not deep, and inclined to be dry. In consequence of neglect, the grass has been killed out by the leaves remaining on the ground, and as I cannot plough it in consequence of the many roots, I am at a loss to know what course to pursue. If any of your readers will confer upon me the favor of recommending any information upon the subject they may possess, I think it will be of advantage to many, by adding to the beauty and value of woodlands, particularly when in the vicinity of the house.

FOR THE NEW ENGLAND FARMER.

LARGE PEARS.

MR FESSENDEN-In your paper of 13th Feb-

ity, as well for flavor, as for size, but do not speak of its quality for baking or eating.

Speaking of large pears, I think those of Boston can go beyond the imported one, weighing by which the hay was deprived of some of its Palladium, showed me a pear the largest 1 ever tuted, which have created the feverish habit in the But the painter has not done the horses justice. to be twenty-nine onnees—the height and circum-greatly obliged to yourself, or any one else who Whether these are published under the direction ference I do not know. Mr Y. offered me pears professes it, to communicate it through the medium and scions from the tree, which offer was accept- of your paper without delay. Anything favorable ed. I visited the tree, in Oliver street, at the foot done by me shall be communicated in due time of Fort Hill, and found the old pear tree on the for public benefit. decline. This variety I had never seen; the form, skin, and complexion, are very much like our Iron or Winter pear-a constant bearer-rather greener and more free from russet color-Flesh light RUTA BAGA, RAISED ON NEW LAND FOR color, tender, and crisp-flavor a little sweetish, juicy, and pleasant. I should think it would make a first rate baking pear. Mr Young informed me the season of its use was from the 1st of December to the 1st of March. A SUBSCRIBER.

Dorchester, Feb. 24, 1829.

DISEASED SHEEP.

Mr Fessenden-My sheep came to the barn in tolerable good order, considering the wetness of the last season. About the first of February yeaning commenced. The lambs have dropped large, healthy and strong. It was found that all the ewes had large bags for winter season; but many were hard, with empty teats, so that no nourishment was afforded for the young. The sheep, with hard udders, have uniformly disowned the lambs; and in proportion to the softness of the bug, was the fondness of the ewes. These rejected lambs have all died, notwithstanding they were taken to a warm place, and fed with new milch cows' milk.* After death, examination showed the lungs somewhat inflamed, the intestines empty, the stomach more or less full of hard curd, and the bladder in many instances much distended with urine. Several of the lambs owned by their mothers have likewise died from three days to three weeks old, and showed appearances similar to the above. Chalk is placed in their pen, of which many if not all have eaten freely. The flock generally speaking has been healthy, although some old ones have died, and several young sheep are poor. Two young ones were unable to bring forth, and although assistance was given, both died. These sheep have been fed on clover, herdsgrass, and red top, with a suitable quantity of oats and corn to keep them in good condition, with plenty of salt strewed on the hay when put in the barn. When the difficulty was discovered, turnips and potatoes were substituted for oats, and occasionally salt petre has been given. As yet no good effect has been produced by this change of diet. The lambs continue to come and die, if disowned within fortyeight hours. One, fed on milk, in which coals have been quenched, has just been opened, shows no other morbid appearance than the bladder very full of urine. Another, just dropped, I shall feed with chalk and spirits of turpentine. I today give in Indian meal a pint of unleached ashes to 25 sheep, and shall pursue it till satisfied no good effects follow; and then substitute glauber salts. Several owners of sheep in this region have as bad and some worse luck than myself, while some have not yet suffered at all.

* It has been recommended to boil the milk of cows, with ruary, I observe you mention again the large pear which it is intended to feed lambs. Boiled milk, it is said, is more easily digested, and is less apt to cruftle, and cloy the stomach of lambs than milk fiesh from the cow.—EDITOR.

The question now comes, what is the cause of this? I can attribute it to no other than, the superabundant crop of hav, cut in a very wet season. 22 oz. Mr Young, one of the late editors of the good and nourishing qualities; and others substisaw. He had just picked it, and found the weight sheep. But I write for information, and shall be Your ob't servant,

JOHN BARSTOW.

Anson, (Me.) February 26, 1829.

FEEDING CATTLE.

At Dead River, Somerset county, Maine, where there are this winter from 3 to 600 yoke of oxen getting logs, the farmers raise Ruta Baga at the rate of more than 500 bushels to the acre, for feeding stock by cutting, burning and clearing the new land, after which the seed is sown broadcast, and harrowed in. No more trouble is taken until harvesting. The whole expense of growing and harvesting a crop does not exceed ten dollars. A Mr Folsom, who grows 100 tons of hay annually, and from 1500 to 3000 bushels Ruta Baga, informed the writer of this, that he could raise the roots cheaper to feed his stock, in part, than hay although mowing lands in a state of nature can be J. B. obtained for a mere trifle.

BROAD WHEELS.

MR FESSENDEN-On reading in your Farmer of the 27th ult, the remarks of "S." on broad wheels, I had it in my mind to reason with him a little on the subject; but turning to your article of January 2d, to which he alluded, I found the subject so clearly discussed that any further remarks would be totally unavailing.

I would recommend Mr S. to make a fair experiment on the subject, and if he should succeed in making a cone revolve on a plane, and at the same time proceed in a straight line, and that too, without sliding in the least, he will have made a very valuable discovery in mechanics. I am of opinion, however, that he will find it as difficult, as it is to prove that each and every part of a carriage wheel while in motion, proceeds with equal velocity at all times, in the direction of the P. R. carriage.

Newton, March 2.

SUMACH.

In my native town, which is about 20 miles S. S. W. of Boston, the Sumach grows spontaneously on hilly pasture grounds: soil deep yellow loam, (not rich) mixed with large cobbles of granite or senite. It grows from two to two and a half feet high, (I mention this because I do not know the species or variety) it bears large clusters of small red berries which may be collected in large quantities in autumn.

Small plants might be bad for the trouble of digging. I have seen the Sumach in many other places, but cannot give account of the soil so correctly. The small plants are sometimes cut with a seythe and dried for use; but, as far as I can judge, without killing the roots.

If these hints are of any use to your correspondent in Maine, they are at his service. O. P. Newton, March 2.

An Initiatory Discourse, delivered at Geneva, 27th ous and venerable of the heathen sages succes-November, 1828, before an assembly, from which, on that day, was formed the Domestic Horticultural Society of the western parts of the state of New York. By MYRON HOLLEY, Esq.

(Continued from page 260.)

The 7th book of Homer's Odyssey contains a beautiful description of the garden of the good and hospitable king Aleinous, of which the following is Pope's translation:

" Close to the gates a spacious garden lies, From storms defended and inclement skies. Four acres was th' allotted space of ground, Fenced with a green enclosure all around. Tall thriving trees confessed the fruitful mould; The redd'ning apple ripens here to gold. Here the blue fig with luscious juice o'erflows, With deeper red the full pomegranate glows. The branch bere bends beneath the weighty pear, And verdant olives flourish round the year. The balmy spirit of the western gale Eternal breathes on fruit unraught to fail: Each dropping pear, a following pear supplies; On apples, apples, figs on figs arise: The same mild season gives the blooms to blow. The buds to harden, and the fruits to grow. "Here order'd vines, in equal ranks appear, With all th' united labors of the year: Some to unload the fertile branches run; Some dry the black'ning clusters in the sun; Others to tread the liquid harvest join; The groaning presses foam with flonds of wine. Here are the vines in early flower descried. Here grapes discolor'd on the sunny side, And there in autumn's richest purple dyed. Beds of all various herbs, forever green, In beautous order terminate the scene. Two plenteous fountains the whole prospect crowned; This through the garden leads its streams around, Visits each plant and waters all the ground,"

But the hanging gardens of Babylon, if they were not more fruitful than that of Alcinous, were vastly more expensive and more picturesque,-And what makes them more interesting is the spirit of courtesy in which they were constructed. Nebuchadnezzar made them to gratify the taste of his wife, who being by birth a Mede, and accustomed to the view of mountainous regions, did not perfectly enjoy the rural prospects of the level country around her husband's capital. These gardens were four hundred feet square, and consisted of terraces raised one above another to the height of three hundred and fifty feet. terraces were ascended by steps ten feet wide, and supported by massy arches upon arches of solid masonry, the whole being surrounded and strengthened by a wall twenty-two feet thick .-The floor of each terrace was made impervious to water, and covered with a sufficient depth of soil to support the largest trees, and the innumerable shrubs and plants with which it was embellished. And upon the upper terrace was a reservoir, which was filled with water from the river by an ingenious engine, of such dimensions as to supply the moisture required by all the terraces.

Among the Greeks, the city of Athens, more illustrious than any other city upon which the sun has ever shone, for the immortal models of art and genius which she has furnished the human race, was surrounded by gardens and groves .-Without her walls, but near them, were those of the Lyceum, of the Cynosarges, of the Academy, of Epicurus, and of Plato. In the tranquil and and walks, and hedges, and porticos, and summer United States' government. For, during the last

sively received, and imparted, all the lights of aneient philosophy.

The Romans were peculiarly fond of gardens. In their cities the common people used to have representations of them in their windows. And several of their noble families derived their names from their cultivation of certain kinds of garden vegetables; as the Fabii, Lentuli, and Lactucini. So attached to gardens were the lowest populace of Rome, that in the inimitably artful speech of Antony over the body of Cæsar, as presented to us by Shakspeare, the last degree of indignation is excited in their minds against his murderers, by the generous disposition which they were told Cæsar had made of his gardens in his will. Antony assures them, " Moreover he hath left you all his walks, his private arbors, and new planted orchards, on this side Tiber :- he hath left them to you, and to your heirs forever, common pleasures, to walk abroad and recreate yourselves." Upon this they could no longer be restrained, but resolved, at once, to burn the traitors' houses.

The most ancient of the Roman gardens referred to in history, was that of Tarquin the Proud, in which that monster is said to have intimated his intention to destroy the people of Gabii, by striking off the heads of the flowers: from which I think it reasonable to infer, that he did not make the garden. But the most magnificent of the Roman gardens were those of Lucullus, which he made when the power of that empire was greatest, and her wealth and luxury the most conspicnous. In these gardens artificial elevations of earth were made to a surprising height; expen- namental cultivation of its pleasure grounds, or sive buildings were projected into the sea, and the profitable produce of its kitchen and fruit garlarge lakes were excavated upon land. The enormons cost of these works Lucullus was able to defray by the spoils of Asia, in which he had been a most successful commander. Plutarch represents him as having possessed eminent military and civil merits, and as having a profound veneration for Grecian philosophy, in which he was deeply proficient; though that distinguished biographer regarded, as frivolous amusements, his sumptuous villas, his walks, his paintings, his statues, and his other works of art. Lucullus was a literary, accomplished, and opulent epicure, and, at the same time, a sincere patriot. For while, on the one hand, he delighted in all the offerings of the muses, and enjoyed them, in the highest degree. with Cicero and many of their other favorites. whom he was accustomed to entertain at his Tusculan villa, with all the dainties of Roman life; on the other hand he was the most cordial and effieient friend of Cato, in the senate-house, in all his the ambitious designs of Pompey and Cæsar.

In the latter days of Rome, the elegant and polished Pliny was devoted to his gardens; and it is probable that his Tuscan villa exhibited the most tasteful and beautiful, if not the most costly garden of all astiquity. Situated in the midst of a vast natural amphitheatre, at the base of the Appenine mountains, and surrounded with hills covered with lofty and venerable woods, with the river Tiber and all its navigation running through the middle of the prospect, it had every external fect the same agreeable combination. These atbeauty of seenery which art and nature could bestow. And within its fences it was adorned with couraged, will insure extensive and lasting beneall the trees, and shrubs, and flowers, and herbs, fits. They are like to be essentially aided by the

tificial fountains, that were theu acceptable to the most cultivated love of rural refinement.

The taste for gardens, in modern times, has not been less universal, nor less operative. They are frequently mentioned in the history of the earliest monkish establishments, and religious houses, during the dark ages. Italy and France have been long conspicuous for their general and ostentatious Horticulture. They are more celebrated for their cultivation of deliclous fruits, for their ornamental and shady walks, and their various and refreshing artificial fountains of water, than for the excellence of their culinary vegetables.

Holland and Flanders were very early distinguished, as they still are, for their love of plants and flowers, in which they have probably excelled all the other people of Europe. Previous to the sixteenth century exotics were more cultivated there than any where else, and their gardens contained a great variety of rare plants. At that early day they carried on considerable commerce in these articles. They imported plants from the Levant and both the Indies, and exported them to England, France, and Germany. Before the time of Henry the eighth, the London market was supplied with colinary herbs and roots from Holland. And during many reigns afterwards the English kings obtained their gardeners from that country.

The soil of Great Britain was considered unfit for the finest productions of Horticulture till within the last century. It was always unrivalled for the freshness and beauty of its verdure. But it has been known only within the three or four last generations to have paid great attention to the ordens. Since the general introduction of forcing houses, at the beginning of the eighteenth century, her noblemen, and other men of taste and opulence, have been wonderfully successful in the finest arts of cultivation. Now there is said to be more certainty of finding pine apples, of domestic growth, in the London market, every day in the year, than there is either in Jamaica or Calcutta.

The total number of vegetable species, not indigenous, in England, introduced previous to the accession of George the 4th, is said to have been 11,970; of which the first 47 were brought in before and during the reign of Henry 8th; 532 during that of Elizabeth; 578 during the reign of the two Charleses, and Cromwell; 44 in that of James 2d; 298 in that of William and Mary; 230 in that of Anne; 182 in that of George 1st; 1770 in that of George 2d; and 6756 in that of George the 3d.

The civilized nations of the earth are now viemeasures to preserve the commonwealth against ing with each other in Horticultural establishments. And since the discoveries of Linnens, a new and most valuable object has been extensively connected with many of them, which has given them additional claims to intelligent favor: I allude to the promotion of Botanic science. Europe has numerous public and private gardens, in which the splendors of Horticulture are most happily combined with this enchanting pursuit.

In our own country there have been several attempts, by individuals, and by associations, to eftempts are exceedingly laudable, and, if duly enelegant retirement of these scenes, the most virtu- houses, and alcoves, and seats, and basins, and ar- year, we were told by one of its public functionatroduction into our country, from abroad, of plants of every description not already known among us, whether used as food, or for purposes connected with the arts, through the agency of our ministers,

Ornamental gardening, in its broadest range, has at one time or another been made to include almost every class of objects, both in nature and art, from the association of which pleasure could naturally be derived. Milton describes the garden of Eden as containing, "in narrow room, naearth."

But the more restricted and essential idea of a garden, is that of a place where, by the aid of cultivation, vegetable productions may be reared more excellent in kind, and more pleasing in distribution, than the ordinary growth of nature .-Beauty and use are both included, though they taste, and skill, and means in cultivators.

trees, and shrubs, and fruits, and flowers, and esculent vegetables, with the best modes of propagating, nonrishing, arranging, improving, and preserving them. To these objects the manuring, mixing, and working of soils, the construction of fences, walks, terraces, quarters, borders, trellises, arbors, and implements, are every where subsidiary; while, in climates subject to frost, the wall, the hot-bed, and the green-house are valuable and agreeable auxiliaries.

The successful conduct of the business of a garden requires labor, vigilance, and knowledge,-Ever since the sentence of the Most High subjected man to earn his bread in the sweat of his face, labor has been the appointed means of his advancement and happiness. Without it, it is impossible for us to have healthy bodies, or cheerful whose youth has been spent behind the counter, minds. And the worth of all the valuable possessions which we acquire, is measured by the amount of it which they respectively involve. It the hopes of gain and the fears of loss, having at is not wonderful, therefore, that much of it is essential to the most desirable Horticulture. Though city and the anxieties of trade, to the pure air of means, to be in readiness to improve such opporit is not merely gross corporeal labor that is required.

" Strength may wield the ponderous spade, May turn the clod, and wheel the compost home; But elegance, chief grace the garden shows, And most attractive, is the fair result Of thought, the creature of a polish'd mind."

And labor is not more indispensable than vigilance-keen-sighted, unremitted vigilance. Many of the nurshings of the garden are so tender and so exposed to accidents, for months together, that an hour's neglect may lead to cureless ruin, and disappoint hopes long and fondly cherished.

But, without knowledge, labor and vigilance are vain. The accomplished gardener must know the best manner and time of performing a great seek a soil more congenial to the best feelings of possible, they should be supplied from the producmultiplicity of manual operations peculiar to each season of the year, all of which are essential to his success, and the knowledge of which cannot be obtained without much experience and observahis pursuit demands care, and reflection, and sea, bringing with him the rarities of every coun-made in the quality. Particular care should be flowers, of which there are several already under- bis native soil, and prefers that his last rest should unavoidably accumulate in the process of manu-

(To be continued.)

EVERY MAN A FARMER.

The cultivation of the earth is congenial to the of men, during some share of their lives, either do, or have a desire to, become farmers. Besides through life, there are thousands of others who retire from the bustle and anxieties of trade, the vexations of a professional, or the turmoils of a public life, to rural quiet and the undisturbed cultivation of a few acres of land. The merchant. whose prime of life and middle age have passed between the leger and the strong-hox, between length realized a plum, retires from the crowded is near at hand, and it behoves all who have the the country and the peaceful cultivation of a farm, tunity as the season may afford. The making of The lawyer, having acquired wealth and profes- maple sugar is highly important to the interests of sional fame, abandons his causes for a more the people of this state; and it is in our opinion tempting cause, the pursuit of agriculture, or min-treated with too much neglect. Great improvegles with his professional labors the excercise of ments may be made both in regard to quantity the spade and the plough. In like manner the and quality. Immense sums of money are annuphysician and the divine, the curers of physical ally carried out of the state for the purchase of and moral diseases, consult their own health and sugar, which is admitted by most people to be quiet, and find a balm for body and mind, by quite inferior to some of our maple sugar. A snatching a few hours from the ealls of profes- great proportion of this money might be saved sional duty, to apply them to the grateful pursuits in this state, by a suitable improvement of the of tilling the earth. Why should we mention the means in our power to prevent it. Sugar is an statesman and the warrior? They too are inclined article of which every family among us, whether to become farmers; the one leaving the field of rich or poor, must necessarily use more or less, ambition, the other his harvest of laurels, both and it is certainly very desirable, that, so far as man, and end the career of life, like Cincinnatus, tions of our own soil. Large quantities and some at the plough. Even the mariner, the adventur- of a very fine quality are made in this state every ous son of Neptune, whose home has been for year, but it is believed that the country might be many years, professionally and practically, on the made to produce double the amount which is now tion. Every direct and every subsidiary object of deep-who has sailed to all lands and visited every produced, and that great improvements may be knowledge. He must not only know the modes try and the products of every clime-purchases taken to keep the sap from all filth as much as and times of propagating trees, and shrubs, and a home on the land, transplants his exotics into possible, and to cleanse the syrup of such as will

ries, that the President had much at heart the in-|stood, as applicable to many of them ; the proper be in the rural church yard with his kindred, to

less esteemed culinary vegetables, which he will dered at, whether we consider it as implanted in were, in their uncultivated state, of but little claim down for a while by the engrossing pursuits of wealth, the calls of ambition, or the strife of glory, But these being satiated or disappointed, the mind aging flowers, by which the single and most set free, returns to its native desires, and applies scentless blossoms of nature have been swelled its remaining energies to their peaceful gratificathe accomplished gardener should understand the mankind ultimately to the cultivation of the earth. Who, that values his native dignity and independence, would not prefer to be lord of a few acres of emphatically say-"I ask no favors"-it is the farmer. Skilful and honest labor is all that the carth requires, and it yields a due return-no favors dearly bought with the surrender of independence, of bonor, of truth, and of all noble and mannature of mankind; and a very large proportion by feelings; no truckling for office, no fawning for popularity, no lying for gain. No man can say of farming "I have served a faithless master! I have those who, in civilized countries, are bred to the sacrificed honor, and conscience, and independculture of the soil, and make it their sole pursuit ence of mind, and what have I gained?" Among farmers there are no deserted Wolseys, and no Belisarius lives a reproach to agricultural pursuits. The choristers of the field never sing to deceive, the flowers of the mead never bloom to hide a deformity, and nature never smiles to betray .- Berkshire American.

MAPLE SUGAR.

The season for the manufacture of this article

facturing. Sap-tubs should never be appropriated to other uses; but at the close of the sugar season, after being well cleansed, should be kept in a clean place, until another season. Iu this way, maple sugar of the finest quality, may be made, superior to any which is manufactured from cane.

Maple molasses may also be manufactured of a quality much better than we obtain from the south, and it can be afforded with a handsome profit to the manufacturer, at a less price. Any quantity that can be made in this state, if well cleansed and rendered pure, will find a ready market in almost any of our villages, at fifty cents a gallon, which it is thought, will give to the manufacturer more net profit than is generally realized upon sugar.

We do hope that those who have it in their power, will in future exert themselves to increase and improve the manufacture of both sugar and molasses. We know by experience that sugaring is extremely laborious, but it is most certainly a sweet employment, and in a good season it is also very profitable .- Nat. Standard.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 13, 1829.

HORTICULTURAL SOCIETY.

Subscribers are hereby notified that a meeting will be holden at the office of Zebedee Cook, Jr. 71 Congress street, on Tuesday the 17th current, at 12 M. for the purpose of organizing the society, by the adoption of a constitution, and the election of officers.

March 10.

MR CHAMPION'S SALE OF STOCK.

The sale of the stock of this eminent breeder, which was announced in the N. E. Farmer, page 7, present volume, took place at the time appointed. The following account of it, is taken from Evan and Ruffy's Farmer's Journal, (London) September 22, 1828.

"Mr Champion's Sale .- This important sale went off with great spirit. Our agricultural readers will no doubt be glad to know some particulars of the sale, and we have accordingly made the following calculations of the averages of the sale of short horns, for their information.

Brought from	Avcrage.		
20 to 60 gs. each.	£30	ຶ9	
20 to 51 gs. each.	29	2	
	20	3	
22 to 32 gs each.	15	12	
22 to 60 gs. each.	36	15	
10 to 30 gs. each.		18	
	20 to 60 gs. each. 20 to 51 gs. each. 15 to 31 gs. each. 22 to 32 gs. each. 22 to 60 gs. each.	Brought from 20 to 60 gs. each. £30 20 to 51 gs. each. 20 to 53 gs. each. 20 to 32 gs. each. 25 to 60 gs. each. 36	

"The total of the 82 lots of short horns, brought the sum of £2234 18s. 6d. The sales of sheep and horses, were made at what may be called a fair, full market price; and the total of the three days' sale may be estimated at upwards of £6000. There were upwards of 500 individuals present, among whom were Lord Apthorp, Sir Tatton Sykes, Mr Harrison, and other eminent breeders from Ireland, Mr Christopher Mason, Mr Wetherell, Mr Bearles, &c. &c.

Potato Flour .- A Dorsetshire farmer, who has recently made some experiments in the preparation of this article, states as the result, that a bag

lands, 150 bags will be produced from an acre so that 6000 lbs. of flour may be obtained from an acre of land.

Erratum .- On page 258 of our last paper, in the 13th subject of the proposed work on Horticulture, for proportions, read propositions.

Greenwich Flower Garden.

The subscriber has lately received his annual importations of Carden Seeds, Bulbons Flower Roots, &c, in ecus, dunous riower Roots, &c, in excellent preservation, of the growth of 1828, from the well known houses of Messrs Warner, Seamen & Warner, and Mr Charlewood, London, and Mr Van Eeden & Co., Harlæm, Holland, who have guaranteed them good and genuine, and no doubt will give the

farmer, horticulturalist and florist, the same general satisfaction that former importations have done.

Also on hand, a choice collection of greenhouse and hardy herbaceous plants, (many of which are very rare;) rose bushes and other shrubs, in great variety, fruit trees, white mulberry, &c. Plants of artichoke, asparagus, sea kale, early frame potatoes, mustroom spawn, &c, with directions for cultivation. The Hyacinthus, Crocus, Narcissus, &c, are in bloom, and will continue in succession a great part of the year. Catalogues may be had at the garden. Orders left at the garden, the post office, or with Mr Molyneaux, corner of Broadway and Ann street, will be strictly attended to. Gentlemen supplied with experienced Gardeners. DANIEL KENNEY.

Carmine and Varick streets, New York. The nearest route to the Carden, Greenhouses, and Seed Store, is from Broadway, by St Thomas's Church, along Houston street, or along Canal and Varick streets.

Fruit Trees, &c.

N. DAVENPORT has for sale, at his Nursery in Milton, a large collection of Fruit Trees, Grape Vines, Green House Plants, &c. His collection of Peach, Plum, and Almond Trees, he considers not excelled in this vicinity: and the collection of other fruits is good. Orders sent to his Nursery in Milton, or left with J. B. Russell, at the New England Farmer Seed Store, No. 52, North Market street, Boston, where a list of the trees can be seen, will be executed at the customary prices.

A very superior Young Jack, imported from Malta, about 18 months since, in the U.S. 74 gun ship the North Carolina. Said Jack is four years old this month. is over 14 hands high and has not yet attained his growth, He is remarkably beautiful, and has all the life and spirit of a blood horse. He was particularly selected for the owner by the American consul at Maha, from the best breed in the island. Said Jack has stood one year in Connecticut, and proved himself a good foal getter. he is not sold, he will be hired out for the season. I farther information, apply at the office of the New England Farmer, or direct through the post office, post paid, to M. C.

Mill Privilege, &c, for sale.

For sale in West Cambridge, six miles from Boston, a valuable Mill Privilege, with about one acre and a half of land, with the buildings now standing thereon, consisting of a good dwelling house, two factory buildings very conveniently built, and other out buildings, and would answer well for a fulling mill, (one being in operation now,) or carding factory; and being situated on a good stream of water, would prove a valuable situation for any similar business. It has been here ofore used as a carding factory, the machines for which are now on the spot, and will be sold if desired, with the buildings. An indisputable title will be given, and payment made easy. Apply to THOMAS RUSSELL, West Cambridge, Captain ADNER STEARNS, Bedford, or J. B. RUSSELL, New England Farmer Seed Store, 52 North Market street, Boston.—It will be sold at auction, April 1, if not previously disposed March 6

Pressed Culinary Herbs.

of potatoes (240 bls.) will produce 60 lbs. of flour; and that plain puddings made with two-thirds potato flour, and one-third wheat flour, are superior to those made wholly of the latter. On ordinary

Scions of Apple and Pear Trees.

MISCELLANIES.

FOR THE NEW ENGLAND FARMER.

Think not, dear Inez, that I grieve O'er pleasures past, and hopes o'erthrown; Or, heedless and ungenteful, pass The sweets with which my path is strown; For many a sweet still lingers there, In spite of time, disease, and care. And do not think I cavy those Whose brighter lot eclipses mine; For well I know, what brightest shows, Not always most deserves to shine. And well I know it is the heart Where happiness must live-And well I know how small the part External things can give. Think not I mourn in "discontent, That life is not what once it seem'd; That all its goods and ills are blent, And darkness shows, where light had beam'd-It is not so .- Though 't was myself, That led your thought astray; And now, perchance, you will not heed Whate'er the muse may say. I did what might not seem so kind Upon a transient view-I smiled on those not half so leved, And " kept my tears for you." "T is sweet to hearts by sorrow prest, (Who has not sorrow known?) To lean upon a gentle breast, We know is all our own. Our own !- ah no-I did not mean What such a word would prove-I only meant,-'t was sweet to lean, Upon the breast we love.

SELECTED FOR THE NEW ENGLAND FARMER.

CAUSES OF INTEMPERANCE.

MR FESSENDEN-The following extract from " The Yankee" may not be considered inappropriate in your valuable paper.

"It is not enough that our youth have congregated together to encourage temperance. Our very children must do so, or their mothers for them: for who after all, are the chief tempters of posterity? Our women-our mothers-our wives. They mingle the taste of strong liquor with the child's pap ;-their soups and sauces are flavored with it-their puddings and pies. The appetite of the babe gives way, and he is stimulated anew. If he will not take wine openly, as wine, sitting up to the table and throwing off a bumper like a man, he must be cheated into swallowing it-it must be sugared and spiced, and flavored with orange peel-anything to make a drunkard of him.

Hence the danger of preparing a child's appetite for relishing the fiery plagues that are one day or other to eat his heart away."

" Behold, how great a matter a little fire kindleth."

Some years ago, a young gentleman, Mr Lpaid his addresses to the sister of Mr B-, with whom he lived in the habits of intimacy and friendship. And it so happened, that, at the same time Mr B- paid his addresses to the sister of Mr L-At length these attentions ripened into nearer connexions, and the marriages of both the young gentlemen were solemnized at one and the same time and place. While the company were together, the two young men, now brothers, stepped out to

a neighboring house of entertainment, with a view, as they said, to "break a bottle of wine together, and bid farewell to their bachelorship." While taking the wine, a sharp dispute arose between some gentlemen, who happened to be present.-Unfortunately, the two brothers took sides, and as the dispute went on, one gave the other the lie .--From this moment hard words were uttered on both sides, and their passions rose to the highest pitch. A challenge was given by the one, and accepted by the other. No delay was desiredtheir seconds were chosen, and the duel fought immediately. Both fired at the word, and both shots took effect. Both fell, and lived long enough to shake hands and forgive each other-soon after both closed their eyes in death !- The reader is left to conceive of the distress and sorrow of the two young married ladies and their friends, for such cannot be described.

ECONOMY.

" " By fixed and permauent principles of economy estates are

Doctor Wheelock, first President of Dartmouth College, made a visit to England to solicit pecumary aid to enable him to carry into effect, his benevolent object of educating a few children of the wilderness. He received considerable sums from generous individuals, and was advised to call on a certain wealthy gentleman for further assistance. He was received by a servant, and while waiting for the gentleman, he heard him in the adjoining room, sharply upbraiding a female servant, for having thrown a small remnant of a caudle into the fire :- On bearing this, the Doctor said to himself, "I shall get nothing here."-the gentleman, however, soon appeared, and when the object of the Doctor's visit was made known to him-he approved of the plan, and handed him a bill, which the Doctor received without examination, expressed his gratitude and retired. Having arrived at his lodgings, on looking at the bitl, he found, to his astonishment, that it was for 50 pounds-presuming his economical benefactor had made a mistake of 50 for 5, he, as an houest man, returned with the bill to the donor, who assured him, that he had made no mistake-"But," said the gentleman, "it is you, who have made the mistake-the conversation which you overheard, respecting the remnant of the candle, gave you a wrong impression-it is that system of habitual economy, which enables me to contribute liberally to the promotion of benevolent and charitable ob-

Method of finding the Course of the Air when the Wind is Still .- Place a basin of water in a free exposure, throw a red hot einder into it, and observe how the smoke which it produces inclines. Sailors throw a live coal into the sea for the same purpose, and also wet a finger, hold it up in the air, and then by feeling which part becomes (by evaporation) cool, they judge of the direction of the current of air. An instrument on the last principle has been invented by Dr B. M. M. Foster .- Mec. Mag.

The Ellsworth Courier states, that there is in Washington county, Me. a farmer 70 years of age, who carries on the farming business on a large scale, and who, to ascertain when his bodily energies begin to fail, is accustomed to jump over a four feet fence on his premises, several times a year. This is what Shakspeare calls a green old age-frosty, but kindly.

SEEDS WHOLESALE AND RETAIL.

For sale at the Seed Establishment, connected with the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of seeds to be found in New England—of the crops of 1828. The greatest care has been taken to have of the close of the greatest care has been maken to have them raised by our most experienced seed growers, and to have the sorts perfectly genuine. They are offered for sale by the bushel, preud, or paper, on favorable terms. Each package for relail is accompanied with short directions on its manage-'the following enmprise some of our most prominent sorts. Pamphlet catalogues gratis.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

THE ORCHARD.

MR FESSENDEN-It is much to be regretted, or even a small number of valuable apple trees.-And in most instances, where any effort of the

It is said that 75 or 100 years ago, apple trees thrifty appearance. grew almost spontaneously, being properly set out, nothing more was necessary, the work was completed; and in a few years they arrived at maturity and produced plentifully. But the course of things has materially changed. Now we mistry ago my grandfather came into possession of the well thinks of raising a neid or corn without the parm which I now occupy, and finding thereon the manure, as to rear an orchard without labor and cultivation. From the little experience I have had, I find particular care and attention indispenthe outset. I have tried different methods in rearing apple trees for bearers. I have several now in a productive state, which were raised from the seed, but none of them producing apples fit for any other use than to make into eider. Others I have which were produced by setting out small trees, and letting them stand one or two years and then grafting them at the ground. These have grown very well, bearing earlier than those raised from the seed. A third class I have, which were taken from Mr Kenrick's nursery, at Newton, in the spring of 1826, being then of two years growth from the inoculation, and although taken from land in a high state of cultivation, and planted on that of an ordinary quality, have done remarkably well, and appear better and more promising than any others I have growing. Should no calamity befall these trees, they will probably in a few years doubly repay all the labor and expense devoted to them.

I have several others taken last fall from the fine nursery of Dr Fiske, in Worcester, which, nursery already grafted or inoculated. In this branches, leaving only two principal ones with two narrow wheels and prepared for to be washed into

FOR THE NEW ENGLAND FARMER.

TRANSPLANTING AND GRAFTING PEAR TREES.

MR FESSENDEN-I notice in your last number some inquiries by a correspondent, respecting fruit first attended with some additional expense, in pretrees, and in answer to his first inquiry whether a pear tree 25 or 30 years old can be engrafted or inoculated with good success, I beg leave to state, that I have a tree in my garden which I had transplanted thither about seven years ago; and which was then, I should think, about 30 years old-a sound thrifty tree, but of a very ordinary kind of fruit. It was taken up with much care, and after degriving it of a large part of its top, I set it in its

way apples of the best kinds may be produced in or three arms on each; more might have been left, a short lime with comparatively little trouble or but as this was an experiment, in the success of which I had not much faith, perhaps less care was I have stated that the trees which I took from taken about it than would have been proper.-Mr Kenrick's nursery appear better and more However, the grafts succeeded perfectly and grew promising than any others I have growing. Al- very rapidly—the natural shoots were all rubbed with buds taken from the grafts before mentioned, particularly careful in taking up young trees to and out of about twenty buds inserted, scarcely Ireak and injure the roots as little as possible, and one failed, and the following spring, the branches

Having succeeded so perfectly to my satisfac--grafting and budding in the same year. Grafts, will, no doubt, produce fruit sooner than buds, but by budding in the manner I have mentioned, a better formed tree may be produced. I have also "unequivocal evidence" that trees of considerable size and age may be as safely transplanted as those of smaller size, by cutting off the top to correspond with the reduced root.

D. F. Yours respectfully, Charlestown, March 9, 1829.

BROAD WHEELS.

Mr Fessenden-I saw in a late number of your useful paper an article written on the subject of broad wheels, from which I understood that wagons with wheels, the tire of which being of a greater breadth than five inches, were required by cause of this novel circumstance, the enriosity of law, and in general use in one or more of the New

I have long considered the regulation of the breadth of wagon wheels, a subject worthy of legislation, as nothing would, in my opinion, contribute so much to improve the condition of our roads. In our state, Pennsylvania, broad wheels are confined to the turnpikes. I am well convinced that the general adoption, though at paring the roads for their use, and a loss from casting away those at present used, would, on a few years trial, be found to contribute to the advantage, as well as comfort of the inhabitants, of any country, where they were in general use.

I have entertained the opinion, that in the construction of wagons, there might be, in addition to the advantage derived from the width of the wheel, another from the axles being of a different prejent situation in the same position in which it length, so that the wheels would not follow exactfornerly stood, but without much expectation, I ly in the same track, but that the hindmost might judging from their thrifty appearance, will flourish | confess, of its surviving this operation, on account | track about five inches nearer together than the equally as well if the same care and attention be of it age; but the second year it began to show two foremest. The adoption of this plan would paid to them. I am now entirely satisfied that it signs of renewed vigor, and the third or fourth be attended with some expense, but would eventis the most economical and expeditious way of year \ had it engrafted with the seckle pear. I wally be found highly beneficial, as the highways rearing apple trees, to take them directly from the had, is before observed, taken off many of its instead of being cut deep as at present with the gullies, would be kept even, smooth, and compact as if it were by rollers.

I would be very thankful if you would be pleased to communicate by private letter, or through the medium of your paper, a sketch of the law on the subject; with information of the place and time of its origin, and also its effects.

Yours respectfully, J. A. CALDWELL.

Harrisburg, Feb. 16, 1829.

The following is a copy of the act, to which the above has reference.

An Act providing fer the use of Broad Rimmed Wheels.

Sec. 1. Be it enacted by the Senate and House of Representatives in General Court assembled, and by the authority of the same, That from and after two years from the passage of this act, the wheels of every wagen, carriage or vehicle built or rimmed anew, and drawn by two beasts (excepting pleasure carriages) passing upon or over any turnpike or common highway, within this Commonwealth, shall have felloes not less than four inches in width, and if drawn by more than two beasts, the said wagon er other vehicle (excepting as aforesaid) shall have felloes not less than five inches in width: Provided, that the wheels of stage coaches passing as aforesaid, may have felloes only four inches in width.

Sec. 2. Be it further enacted, That the owner or owners, and also the driver of every wagon, carriage, or other vehicle, having wheels contrary to the provisions of this act, who shall drive or suffer the same to be driven, upon or over any turnpike or common highway within this Commonwealth, shall forfeit and pay for each offence, a sum not less than five dollars, nor more than twenty dollars, to the use of the Turnpike Corporation, City, Town, or District liable by law to support the before any Justice of the Peace within and for the county within which the offence shall have been committed, not being a member of the Turnpike Corporation, or an inhabitant of the City, Town, offer for these remarks. or District liable for the support of the Turnpike. or common highway as aforesaid: Provided, however, that the provisions of this act shall not extend, or be applied to either of the counties of Dukes or Nantucket, nor to any carriage passing upon or over any of the roads aforesaid, solely for the purposes of common husbandry. And provided further, That no prosecution shall be sustained under the provisions of this act, which shall not be commenced within ninety days from the commission of the offence, upon the complaint of the Treasurer of the Turnpike Corporation, or one of the Surveyors of Highways within the City, Town, or District liable for the support of the road upon which the offence shall have been committed, to a Justice of the Peace having cognizance of such

Sec. 3. Be it further enacted, That this act shall be published in the months of January and October in each year, for the term of two years, in all the newspapers in which the laws of the Commonwealth are published, and shall also be read at the annual town meetings in March and April, for the same term of years.

Approved by the Governor, March 8, 1828.

To the extreme South, the late storm and subsequent cold, are spoken of as severe.

FOR THE NEW ENGLAND FAREER.

I was gratified to learn by the notice in your paper, that the public would be favored with an abridgment of Duhamel's celebrated Treatise en Fruit Trees, and still more pleased thatit was to be accompanied with additions and remarks adapted to our climate by a very experienced cultiva-

I am not aware that Duhamel's Treatse has ever been translated into our language, no do I know of any abridgment of it, unless it be that of Coxe. It is true that Coxe does not mention Dubainel, yet the arrangement, names and plates of his pears would seem to indicate, that he had the benefit either of Duhamel, or of the Abbè Rezer, who avows, that his Treatise is a simple copy from Duhamel.

Duhamel's work is at this day esteemed the first in France, preeminently the country of fine fruits conjecture. -and the learned members of the London Horticultural Society, superior to national prejudices, assign him the highest rank. Duhamel, united to more science than any other writer on fruits, possessed most minute practical knowledge acquired things which are agreeable to taste produce an during almost as long a period as can be boasted opposite effect to this; more especially where of by the venerable Thomas Andrew Knight.

Permit me to say one word on the opportunities and acquirements of the publisher of the proposed work. I know of no person in this vicinity who has had so much experience or success. For had a favorable opinion of pomace, and of its pre-25 years he has superintended an extensive collec- servation by drying for winter's use. But the tion of fruits with consummate skill. He has al- trouble of curing, and the great difficulty of preways enjoyed the advantage of the first edition of serving it free from must, and acid fermentation Duhamel colored under that enlightened man's own inspection; and few persons have made more by considered. The time too, taken herein would, extensive experiments suggested by their own probably, be better compensated by increasing minds. I should consider such a work, the fruit of so much experience, of great importance to the turnpike, or common highway, upon which the of- publisher will be encouraged by a liberal subscripfence shall have been committed, to be recovered tion, to give Duhamel's figures, at least of the fruits, if not of the foliage and flowers.

My known enthusiasm for the improvement of our horticulture is the only apology which I can JOHN LOWELL.

Roxbury, March 14.

FOR THE NEW ENGLAND FARMER.

APPLES AND POMACE AS FOOD FOR STOCK, &c.

MR FESSENDEN-I have observed in the course of your useful labors, that you have submitted to your readers occasionally, some inquiries, remarks, and experiments on "the convertibility of pomace to some useful purposes." First " of nutrition for animals," secondly as " an article in itself condu cive to the enrichment of soil, or as a component material in the Compost Heap."

On these points some opinions are herein suggested, rather as matters of conjecture than otherwise; not having gone into any accurate analysis, and the result of some experiments on the subject are likewise submitted.

And first, as to nutrition, there can be no doubt that sweet apples are conducive to the fattening of therefore, as far as these prevail, is doubtless nutritious in some degree.

difficult to ascertain as a component part of substances, is yet admitted to be highly productive of nutrition. It is for these the swine so diligently search, as well as the poultry.

But any further than may be derived from the saccharine matter in the seed in pomace, it would seem improbable that much animal nutritive matter could be obtained from a substance so abounding with acidity.

I find in your Journal, under date of October 6th, 1826, that one of your correspondents by turning his hogs into his orchard, thought that he experienced some benefit. So also with his horse. But as there was nothing very precise in his experiments as to other food, nor any means of judging how the sweet apple might have prevailed, there did not seem to be anything decisive on the subject. The sweet apple tree probably does not exceed one in forty. This is, however, mere

The spirit with which fruit abounds, and the fondness of animals for it, as noticed by your correspondent, are not entirely conclusive as to the prevalence of nutritive properties therein ; many acidity prevails. So also others are highly disagreeable, which when often recurred to conduce to great thrift, viz. oil-cake, &c.

The late General Derby, of Londonderry, N. H. could not have been, it is apprehended, sufficientvegetable products of more certain effect.

One or more instances of cattle that have supted a good condition the most of the time about these heaps has been stated in your paper. But those are too indefinite to be wholly relied on .-For, first, the cattle had access to other food, and, secondly, the prevalence of sweet fruit in the pomace would doubtless produce such a result. It is therefore submitted, whether, for these and other reasons that might be urged, the little value which is attributed to this article by our farmers needs correction? Nothing has been said of the pesitive disadvantages herein to stock; although many are full in the helief of its injury; such as swelling the bowels, setting the teeth on edge, exciting an aversion to dry food, &c.

It seems then, that in the application of pomace te animal support, as far as the seeds go, the benefit is apparent-anything farther depends on circomstances of some uncertainty, and that promise, at best, no very essential advantage.

It will be perceived that the whole subject is proposed for discussion by your correspondents .-The considerations, which belong to utility in the enrichment of soil will be next offered.

Dorchester, March, 1829.

Remarks by the Editor .- We conceive the objects of inquiry embraced by the preceding comcattle as well as horses and swine. This is affirm-ed-by many observant farmers. The ponaco, involve are important, and applicable to other articles used as food for animals and plants, besides So also in the seeds of the apple. In these apples and pomace. We hope that "W." will there is much gluten, saccharine matter, il, ar pursue his inquiries, and that both practical and ematic flavor, &c. The latter of which, nough philosophical cultivators will also contribute their

aid in the investigations connected with the topics of his new threshing mill. I believe, that no inwhich he is so ably discussing.

We insert the following in order that both parties may be heard in a controversy, which we hope will be closed with this document .-- EDITOR.

FOR THE NEW ENGLAND FARMER.

SIR-The remarks of "Essex" in your paper of the 13th inst, upon the Report of a Committee of the Essex Agricultural Society, are in a style and of a character, " that should not pass without notice." Taken in connexion with the Card that appeared in your paper of the 7th inst, it is highly probable, at least, that they originated directly or indirectly, from the same source. Believing this to be so, notwithstanding the affectation of apology made by "Essex," I think it a duty the Committee owe themselves and the public, to state some additional facts, in explanation of what has been published. When these facts shall be properly considered, I shall cheerfully submit to the public to determine, whether the Committee are justly charged with making an "ungenerous and covert attack" upon this gentleman and foreigner? or, on the contrary, whether he did not in the first place, attack the Committee and the Society, in a manner altogether unbecoming a gentleman, and entirely without provocation?

So far as the remarks of "Essex" contain rules for forming reports, or strictures upon the style in which reports should be written, I have no disposition to question their correctness. I am willing that the paper criticised should be tried by these rules. The insinuations and misrepresentations of " Essex" on these points are well and satisfactorily answered, in your notes annexed to the re-

But so far as they charge the Committee with being influenced by "unworthy and low prejudices,"-" with a want of knowledge, or judgment,"-with " want of delicacy," or " violations of propriety,"-with "uncandid and unwarrantable remarks," with "prating," with "illiberality," and with "little practical concern with agriculture in any of its forms;"-it is proper to inquire whether or not these charges are well founded .-These accusations relate, almost exclusively, to that part of the Report, which speaks of the In- he did. It is possible, that they did not judge dian Hill Farm. Because the Committee spoke in correctly in this matter; and it is equally possible relation to this farm, as they felt it to be their duty have passed this farm in silence, if they could and the opinion of one, interested (but modest) tion of this valuable material.—Delaware Advertiser. have done so with propriety. But it being genum, they thought it would be shrinking from their would allow "Prejudice to predominate," is not ed the Legislature. the courteous, sensitive, and delicate " Essex."

knowledge in relation to this farm. I regret that which were spoken of in the highest terms of apduty requires this to be done. I regret also the probation by the Committee. As no premium years, from the time of planting such trees. necessity of animadverting upon the conduct of a was offered for work done by horses, the Commitgentleman, whom I have, at all times, been dis- the awarded to this team a gratuity, equal to the posed to treat with respect and civility; and from lewest premium offered. Whether Mr G. is diswhom I have at all times, personally, received a suisfied with the notice that was taken of his horsecorresponding treatment.

dian Hill Farm for premium. The Committee ter visited it in June and in August, as they did other farms ;- and also on the 24th of September, at the admit the fact, that there is no farm in the vicinispecial request of Mr G., to see the first operation ty where a greater produce has been raised in of Delaware.

timation was given by the Committee, or any one in relation to the management of this farm. Mr I am ready to join the issue, and if the testimony G. was informed, both by the form in which the premiums are proposed, and by the Committee personaly, that a detailed account of his operations upon the farm, of the quantity of labor emplayed, of the expenses incurred, of the crops, products stock, &c. &c. upon the farm, would be expectel from him by the Committee. Mr G. promised o furnish the same. At the meeting of the Connsittee on the 29th of Dec. last, to award the their Report.) From the remarks of "Essex" premiums-this statement had not been furnished, himself, it would seem, at least, that some experinor any reason given why it was withheld. The Committee addressed a line to Mr G. soliciting this statement, that the same might be published in connexion with their Report ;-and at the same time informing him, that his farm having been entered for premium, and having been repeatedly visited by the Committee, they could not, consistently with their duty, omit to speak of it. They received an answer addressed to the Secretary of riculture, as he would intimate the Committee the Society, in the words following, viz.

"The letter from the Committee on Farms was duly received, in reply to which, I would observe, past season, were neither worthy of premium, of that for the visit of the Committee I am much obliged-but after the decision of the Committee on Ploughing at the Cattle Show, I determined not to give the result of my farming-fully believing that PREJUDICE WOULD PREDOMINATE."

As Mr G. has repeated in his Card, addressed to the public, that he withheld his statement of the result of his farming, on account of the decision of the Committee on Ploughing, at the Cattle Show, I will briefly state what I believe to be the facts, in relation to this point ;-though I had no voice in it, or knowledge of it, until it was made public by the Committee. There were eight double teams in the ploughing match, of which Mr G. had charge of one, and was himself ploughman. There were four premiums to be awarded. The Committee, five in number, were all practical farmers, with much experience. They did cause others, in their opinion, ploughed better than that they did. We have the opinion of five, comwitness on the other. But whether they did judge erally known in the county, that they had visited correctly or not, how it follows from this, that anthis farm, and that it had been entered for premi- other committee, on a subject entirely different, duty, to omit to say, what they did respecting it. casily understood by the rules of logic to which I Much more might have been truly said, which have been accustomed. It should also be stated, tires of the State of Delaware in General Assembly would probably have been still less acceptable, to that Mr G. had a pair of horses in the ploughing field, which performed their work exceedingly I will state, sir, some facts within my own well, to the admiration of all who saw them, and Mr G. early in the last season entered the In- I an not advised-but presume it must be the lat-

Says "Essex," " we believe, and his neighbors

proportion to the expense, &c." than upon the Indian Hill Farm. Then why withhold a statement of them, a either of these visits, of their opinion of the produce and the expense? On this point of neighbors is to be taken, I have no fear of proving, that the expenses upon this farm the past season would far exceed the gross amount of all its products, estimated at their highest value.

> But sir, I forbear, at this time stating particularly, those things in the management of this farm. which the Committee thought of doubtful expediency ;- (and more than this they have not said in ments have been made, and that some of the plans pursued were of a doubtful character. If " Essex" will condescend to annex his name to his communications, I will engage to examine the subject upon its merits. And though I may not be able to enumerate high sounding names, or wield "rhetorical flourishes" as he does ;-and though I may be as wanting in that practical knowledge of agare ;-still, I believe I can satisfy a candid public, that the operations upon the Indian Hill Farm, the approbation, or of imitation.

That my brethren of the Committee may not labor under the aspersions cast upon them by "Essex," of "want of delicacy, or violations of propriety," of "aiming at wit, or what looks like it," &c. I will simply say that the language of the Report is mine, -(that it was written in haste, in one evening, and perhaps with too little care;) but that the opinions therein expressed were unaniniously approved by the Committee; and that after a reexamination of the same, with the benefit of the mild and civil remarks of "Essex," we do not find occasion to alter what is there stated.

Respectfully yours, &c. JOHN W. PROCTOR.

Danvers, March 16, 1829.

We tender our thanks to our agricultural friend not award a premium to Mr G .- not because he who last week presented us with two specimens did not plough well, as I learn from them, but be- of American silk. These although (as we are informed,) produced from the common mulberry of our forests, are beautiful indeed.

We do hope our agricultural friends generally, will call in and view our specimens of silk. These to speak, offence is taken. The Committee would petent, disinterested witnesses on the one side; well demonstrate the practicability of the cultiva-

Great attention is now paid in Delaware to the culture of silk. We have been favored with a copy of the following resolutions which have pass-

Resolved by the Senate and House of Representamet, That all lands within the limits of this State, which now are, or futurely shall be, actually employed and occupied in the growth of silk, shall be exempt from taxation for the space of ten

Resolved further, That to each and every individual who shall plant and bring to perfection within the limits of the State, two hundred such Mulberry trees, within the space of five years tem-or the omission to take notice of his ox-team, from the first day of May next, there shall be given by the State, a silver medal of the value of five dollars.

WILLIAM HUFFINGTON. Arrest. Clerk of the House of Representatives of the State An Initiatory Discourse, delivered at Geneva, 27th November, 1828, before an assembly, from which, on that day, was formed the Domestic Horticultural Society of the western parts of the state of New York. By Myron Holley, Esq.

(Continued from page 268.)

The productions of the garden are affected, either for evil or for good, in the different stages of their growth, by the most minute and the most magnificent objects in nature, by the bugs, by the worms, by the flies, by the birds, by the clouds, by the air, by the sun. The knowledge of these objects, with all their means of favor or annoyance, and the superadded knowledge of all the other objects and means by which the effects of these, so far as they are good, may be promoted, and so far as they are evil, may be prevented, should be embraced within the scope of his acquirements. The acience of Horticulture, therefore, does not merely admit-it demands, excites, and favors the most extensive and diversified intellectual attainments.

But, it has pleasures to bestow which amply repay all its demands, both upon the body and the

mind.

It gratifies all the senses.

The feeling is gratified, by its smooth walks, its soft banks, the touch of many of its leaves, and fruits, and flowers, and by the refreshing coolness of its shades.

The smell is agreeably excited, from unnumbered sources. From the lowliest pot-herb to the stateliest tree; from the humble violet and mignionette to the splendid tulip and the quecaly rose. a garden is the unrivalled repository of fragrance.

The gratification of the ear, in a garden, is adventitious, not of man's procurement, but nevertheless certain and real. The most tasteful of the animal creation, in their flight, from one end of the earth to the other, discover no spot so alluring to them as a well replenished garden. The birds are fond of its shade, its flowers and its fruit .--Amidst these they love to build their nests, rear their young, and first win them to that element which seems created to be their peculiar field of joy. And if they sometimes commit unwelcome inroads upon the delicacies which we prize, they more than compensate us by their cheerful and continual songs, and by destroying innumerable and more dangerous intruders in the air, in the trees, upon the plants, and on the ground.

The taste finds its choicest regalement in the garden, in its sweet roots, its crisp and tender sallads, its nutritious and acceptable pulse, its pungent and salutary condiments, its fragrant and delicious fruits, with a countless list of other palatable productions, all existing in such inexhaustible variety, that the art of cookery takes more than half its subjects from that overflowing store-

But the eye delights in a garden, as if all its labors, its cares, and its knowledge had been dedicated to that single sense. From every quarter, and border, and arbor; from every bank, and walk, and plant, and shrub, and tree; from every single object, every group of objects, and every combination of groups, spring forms of beauty, fresh, living, well proportioned, graceful beauty, natural though cultivated, innocent though gay.

Horticulture gratifies the higher faculties of our nature, the intellectual taste, the reason, the heart.

pleasure, derived from art, has been so universal power had never been worse applied!

as that taken in gardens." And from the remark we should infer, what the history of every enlightened people will demonstrate, that, on no subject have men exerted themselves more, or the display of taste, than on this. That delicae power of gifted and cultivated minds, which almost intuitively discerns, and nicely enjoys, all the renuine beauties of nature and art, and turns with sudden disgust, from every species of deformity, as always regarded a well stored, well arrangel, and well dressed garden with peculiar satisfaction .-And this is undoubtedly, owing, not solely or chiefly to the numberless and exquisite gratifications of sense which such a garden affords, but also to the pleasing effect which it naturally produces on the imagination, and other faculties of the mind.

All desirable objects which excite the mind without fatiguing it, are the sources of agreeable emotion. And the senses, which we have seen are all brought over to be the advocates of Horticulture by most of the wealth of nature, of which they can appreciate the value, are, in a garden, constantly soliciting the mental faculties. The eye particularly, by its delicate susceptibilities, its great range, and the number of objects which it can embrace at a single glance, is forever exciting the imagination by the most agreeable appearances which it presents, of color and form, each considered singly in all its varieties, and both blended into combinations more diversified and more beautiful than even those of the kaleidoscope. And the imagination yielding to the excitement, calls up the other intellectual powers to partake of her pleasures. Then, the higher joys of taste commence; then, the exalted beauties of order, design, intelligence, are disclosed: then, objects are viewed in reference to their congruity, their contrast, their regularity, their proportion, their simplicity, their variety, their novelty, their beauty, their sublimity, their adaptation to an end, and the value of that end. Each of these views introduces a broad theme of agreeable contemplation. Collectively they comprehend all the charms and glories of the external world; every thing but the moral sense, and the sympathies of the heart. And I shall endeavor to show, that they are of vast importance to the highest improvement and proper enjoyment of these. But, before entering upon that exhibition, which necessarily refers to the most comprehensive and permanent benefits of which man can be made the partaker, permit me to advert to several of the subordinate benefits of Horticulture.

The proper objects, and pleasures, and uses of Horticulture are all beneficial, and are acknowledged to be so, universally. And it may well be thought extraordinary, with this acknowledgment, that societies for its promotion were not earlier established. It is not surprising that they did not exist among the nations of antiquity, because, among them, there was not, in general, indulged to private people sufficient freedom of communication and concerted 'action to permit such institutions Besides, if the inclinations of the common people were ever so much in favor of the fruits and pleasures of gardening, it was impossible for any to ciltivate or to enjoy them extensively, but the great ones of the earth. They were of too costly a 'elish for general participation. Kings, and prices, generals, and senators, applied to them their rower, with emulous devotion. How would the inter-Doctor Aiken has justly remarked, that "no ests of humanity have been promoted if their

But considering the more enlarged diffusion of wealth and freedom, in modern times, it might have been expected that associations, in aid of their rational pleasures, and beneficial uses, would have been sooner commenced and more generally adopted. It is believed that no such association existed in the world before the latter end of the last century. Though if their rise was late, it was honorable. It is certainly creditable to human nature that the first of these institutions proceeded from the exalted and liberal motives originating in the love of science. Botanical societies paved the way for Horticultural societies, and for associations, in which the objects of both were happily united. Soon after the great northern light of the world of natural science shed its benignant beams. with peculiar brilliancy, upon botany, revealing all the recesses of that science to the admiring observation of man, societies were instituted for its promotion. Several of these exist on the continent of Europe, under the patronage of men illustrious for science and philanthropy.

(To be concluded next week.)

DISEASES OF THE TEETH AND GUMS.

Bad teeth are sometimes the effect of (Ist) general bad health; but they are more commonly the effect of local causes. One of the most fruitful sources of diseased teeth is (2d) the alternate effect of heat and cold-breathing cold air, drinking hot tea, eating hot victuals, and taking water into the mouth immediately after. In the West India Islands, where the climate is uniformly warm and the water not cold, the inhabitants are remarkable for their fine teeth, except in the Island of St Croix, where the water issuing from the sides of the mountains is very cold, and of course a great luxury and much used, the inhabitants have bad teeth. (3d) Unskilful dentists frequently occasion the destruction of teeth by filing or in other ways destroying the enamel, but more commonly by the use of acid dentifrice, washes, and powder. These whiten, but wound and create a morbid sensibility in the nerves and corrode the enamel, in both ways insuring their decay. (4th) Biting hard substances is extremely hurtful, not from the mechanical injury done to the bone of the teeth, but from its affecting the fine organization of their vessels and producing internal diseases and decay. (5th) Permitting the teeth and gums to become foul, the accumulated matter growing acrid and corroding the teeth or irritating the nerves. (6th) Remedies applied for the toothach, such as the metalic salts and the essential oils. (7th) One diseased tooth, by internal sympathy, or by the deposition of matter externally, injuring others. (8th) The scurvy : which is occasioned by the irritation of tartar, that is suffered to accumulate on the teeth. (9th) By the gums becoming soft and spongy from not being sufficiently rubbed. (10th) Tartar is produced by the neglect of cleaning the mouth. These are some of the principal causes of diseased teeth. Good teeth contribute to beauty; to health, by enabling us to masticate our food well; and to pleasure, for a person whose mouth is filled with decaying bones, must be disagreeable to himself and others. Avoiding the causes will do much. A few preventive and curative remedies will be mentioned.

I. The mouth ought to be rinsed, and the gums and tongue rubbed with a brush early in the morning, to remove the accumulation of the preceding night. 2. The mouth should in the same manner be washed after meals with water not cold, and

teeth by a tooth pick not made of metal. 3. To ease the pain of a decayed tooth, the best remedy by step. It is our policy rather to seize and profit complete success, viz. Recipe for curing a hunis powdered camphor, introduced into the cavity by the last results of her magnificent and costly ex- dred pounds of Hams or Beef. on the point of a tooth pick, and secured by put- periment in this department. A few years ago, there, ting raw cotton over it. The tooth must be made clean, so that the camphor can come in contact with the diseased nerve, and the camphor must lie so lightly on it as not to produce pain by its pressure. This will relieve the pain, correct the fetor of the decaying tooth, and do no injury to the sound teeth, whereas oil of cloves or cajuput are less certain to give relief, and always do mischief by roughening the other teeth, and favoring the accumulation of tartar. 4. Tartar is produced by the neglect of washing and cleaning the mouth. It might have been more useful, had it been earli-Where teeth are naturally smooth and the gums er attended to. The effect should have been, to sound, mastication alone is often sufficient to pre- prevent the spread of the canal system to some vent the accumulation of tartar; but if from toothach or other cause, the teeth of one side are not its favorable prosecution: and in the place of caused, tartar will collect without the greatest care. nals, substituted Rail Roads, as the last and best This substance injures the teeth by its direct effect trophy of experience. upon them, and by its irritating the gums, and producing scurvy. It may be prevented by washing is advancing. In New York a company of enthe mouth often, or picking the teeth with a pin of gineers had been instructed to survey a line for dry wood. If these are not sufficient, and powders are necessary, beware of those which have a engineers have reported :-- their report has been rough grit, or acids in them. The best tooth accepted by the Board of Directors, and we unpowder is finely levigated charcoal. The best derstand that the work will be commenced early brush to apply it with, is a small stick of the al- in the spring. Massachusetts, too, is determined thea shrub, made into a small broom at the end by biting it between the teeth, but better than this to rub between the teeth is a piece of seasoned oak wood, made pointed and broomed by biting it. If, however, the tartar has been long fixed, and adheres firmly, it will be necessary to remove it by instruments. The point of a penknife will for the most part be sufficient, but the process will be aided by a small sharp hook, which scraping towards the end of the teeth are less liable to injure the gums. 5. The scurvy is cured by removing the tartar, by rubbing the gums with what is called a tooth brush, but which more properly might be called gum brush. The powder of Peruvian bark is excellent to rub into the gums; it should be kept between the cheeks and teeth, and the gums should also be washed with a decoction of it. If the scurvy is bad and has continued long, the whole system becomes taiuted with it. In this case, or if the system is feverish, it will be necessary to take half an ounce of bark, and 60 or 70 drops of elixir vitriol daily. If it is objected that the gums are too tender to permit the use of the brush, this is an evidence that it is needed. A brush and tumbler of water not cold, or suds of old Windsor soap, if assiduously used, will for the most part, keep the gums hard. If, however, the gums show a disposition to become soft and spongy, bark may be used as a preventive.

RAIL ROADS.

The good cause, of Rail Roads, seems to be finding more and more favor in the eyes of the community. We are ourselves among those who never doubted their superiority as a means of intercourse in this country, over canals. And it is pleasing to observe the prejudice which at first was excited against them, giving way to common sense views of the subject. In prosecuting our systems of intercommunication, we have had the housekeepers how to cure their meat; but fear- the salts with a pint of molasses; with this comopportunity of profiting by the experience of other and older nations-particularly of England. But ticular, (the time the meat should remain in the in a tub five or six days; then take them up; rub if we are many degrees behind that nation in the pickle, I am induced to recommend a pickle that on the remainder of the composition, if any be

sary consequence that 'we should follow her step mending to others for a quarter of a century, with as here, Rail Roads on anything of an enlarged scale, were unknown. The canal system and policy were triumphant, and extended to every work of inprovement of a general character. At the present day the thing is widely different. After great experience in canals, and not a little in Rail Roads, the people of England have given sufficient indications of a decided preference for the latter. So far as we are disposed to derive benefit from the experience of other nations, this is a useful fact. sections of our country no ways calculated for

But, as we observed, the cause of Rail Roads a Rail Road from Schenectady to Albany. The not to be idle. She proposes to take up the line of Railway at the Hudson, near the termination of the above mentioned Road and carry it to Boston. Thus opening a continued communication by Railways, between her metropolis and the western parts of the State of New York. And consequently exhibiting herself as a competitor for her share of the trade of that country and the lakes. A part of this line, must of course be undertaken in conjunction with the authorities of New York. At a great meeting of citizens at Faneuil Hall a few days since a resolution was submitted, declaring the expediency of constructing this Road by the commonwealth. - It was carried by a vote of 3158 to 24. Another resolution was submitted to the meeting-dcclaring that if the Legislature should deem it inexpedient to engage in the measure, " the city government be authorised and requested to apply to the Legislature for an act to enable any cities, towns, or bodies corporate, or individuals to subscribe to such portion of said stock as may not be taken by the state, on such terms and conditions as may be deemed expedient."

The vote on the latter resolution was taken and carried by 3055 yeas to 29 nays. The result of these proceedings, and votes, show a unanimity of purpose, at the head quarters, that gives a pretty earnest promise of ultimate success to the proposed undertaking. Convinced as we are that the Railway system is the true one for this country, we rejoice to witness its development wherever the increased demands of society require new facilities of intercourse .- Baltimore Patriot.

DOMESTIC ECONOMY.

On looking over your valuable paper of Wednesday last, my attention was arrested by the observation of a person recommending to farmers and ing it is not definite enough in one important par-

all extraneous matter removed from between the affairs of internal improvement, it is not a neces- I have been in the practice of using and recom-

Take 7 lbs. of coarse salt.

2 lbs. of brown sugar.

2 ozs. of salt petre. 1 oz. of pearlash.

4 gallons of water.

Boil all together, and skim the pickle wellwhen cold put it on the meat.

Hams to remain in pickle eight weeks-Boef four weeks .- Western Farmer.

To Cure Pork .- Cut up the meat the same day the hog is killed, if practicable, and pack it well in a cask, with plenty of hest coarse salt; when the cask is full, have strong pickle that will bear an egg, ready, and immediately put it on the meat, so as to fill up all vacancies and to exclude the air .-U. S. Gazette.

LIVE FENCES.

Messrs, Grant Thorburn & Son,

Gentlemen-I perceive by your advertisement in the last number of the "New York Farmer," that you have imported 75,000 hawthorns for "live fencing," and I cannot deny myself the pleasure of communicating to you, the experiment that I have made with this beautiful, cheap, and valuable fence. About seven years ago I purchased a few thousand from you, and set them out, forming a line of fence of about forty rods. The soil on which they were planted was a mixture of clay and white sand, unfavorable to their rapid growth. They have never been cultivated except to trim them the last season-every plant flourished, and they now form a fence sufficient to turn any cattle, and the cheapest, handsomest, and best fence upon my farm.

I have saved a bushel of the berries and intend to have a nursery of hawthorns.

If our farmers are fully apprised of the preference, in all respects, due to this kind of fencing, you will find a ready sale for all you have imported, and I venture to assert, that every gentleman, who will make an experiment with them, will be highly gratified with the result.

I remain yours very respectfully, JONATHAN FISK. Newburgh, N. Y. Feb. 17, 1829.

A part of the Hawthorns alluded to above. are for sale at the New England Farmer Seed Store, 52 North Market street, Boston, at \$5 per 1000.

From the N. E. Farmer and Mec. Journal.

MR EDITOR-As Bacon is an article of Domestic manufacture, and when good is generally esteemed, and, as most persons have a rule of their own, or, I should rather say, none at all, for the benefit of all, I send you one that I have followed several years with entire satisfaction; and only request brother farmers to give it a fair trial.-For eight hams, take 2 pounds of salt, and five ounces of salt petre, both finely powdered; mix position rub them thoroughly: pack them closely left sprinkle them over with fine salt. In repacking, take care to turn them ;-let them lie five or this Society are not to be hid under a bushel ; what six days; then cover them with a brine that will the capacity, and industry, and perseverance of bear an egg. Let them lie thus covered, a month, and they are fit for smoking. It is thought by some, that corn cobs for burning, give them the best flavor. If the smoke-bouse is good, and proper attention is paid to them, they will smoke abundantly in a few days, and need not be smoked from 3 to 6 months, as it is said Westphalia Hams

It is a source of real gratification to us, that we are enabled to state, that upwards of one nun-DRED and SIXTY have become subscribers to this institution. No extraordinary exertions have been made to induce gentlemen to become members .-The objects of the Society are pretty generally known, and appreciated. That it will have a decided influence upon the horticulture of the State generally, we feel certain; and we presume it will not be deemed invidious, if we say, that its benefits in a practical view, will be felt, and seen, and tasted extensively within, and contiguous to the city.

The talent and industry of those who compose men can accomplish, in aid of the products of the garden, and the field, we believe will be done by the influence and efforts of the members of this Society. There are comprised among its associates, many of our scientific and opulent citizens; and many of our highly respected practical culti-

We hope that none who are desirous of joining the Society will be deterred, by the belief that its ranks are full. There is yet room, and we do not doubt, that before the anniversary meeting in September (the month of fine fruits) its present number will be doubled.

It is desirable that those who wish to become members should signify their intentions to some one of the Society, that they may be proposed at the next stated meeting. The Constitution and Laws of the Society with the names of its officers and members will be published in a few weeks.

WILLIAM PRINCE, Esq. proprietor of the Linnæan Botanic Garden, at Flushing, Long Island, has with a promptitude and liberality that is highly appreciated by the Society, proposed to present for its use, FIFTY TREES of the finest varieties in his Garden, so soon as any one shall be designated to receive them.

An official notice which we trust will be rendered acceptable to Mr Prince, will be made in due

NOTICE.

The Board of Counsellors of the Massachu-SETTS HORTICULTURAL SOCIETY, are hereby notified that their meeting stands adjourned to Tuesday, the 24th current, at 11 o'clock, A. M. then to be holden at the office of ZEBEDEE COOK, Jr, in Congress street. R. L. EMMONS.

Boston, March 18, 1829. Recording Secretary.

For Sale.

A very superior Young Jack, imported from Malta, about 18 months since, in the U.S. 74 gun ship the North Carolina. Said Jack is four years old this month, is over 14 hands high and has not yet attained his growth. He is remarkably beautiful, and has all the life and spirit of a blood horse. He was particularly selected for the owner by the American consul at Malta, from the best breed in the island. Said Jack has stood one year in Connecticut, and proved himself a good foal getter. If he is not sold, he will be hired out for the season. For farther information, apply at the office of the New England Farmer, or direct through the post office, post paid, 2w.

Mill Privilege, &c, for sale.

For sale in West Cambridge, six miles from Boston, a valuable Mill Privilege, with about one acre and a half of land, with the buildings now standing thereon, consisting of a good dwelling house, two factory buildings very conveniently built, and other out buildings, and would answer well for a fulling mill, (one being in operation now,) or carding factory; and being situated on a good stream of water, would prove a valuable situation for any similar business. It has been here ofore used as a earding faetory, the machines for which are now on the spot, and will be sold if desired, with the buildings. An indisputable title will be given, and payment made easy. Apply to THOMAS RUSSELL, West Cambridge, Captain ABNER STEARNS, Redford, or J. B. Russell, New England Farmer Seed Store, 52 North Market street, Bosion.—It will be sold at auction, April 1, if not previously disposed

Pressed Culinary Herbs.

Fressea Cauring Tirros.

For sale at the New England Farmer Seed Store, No. 59, North Market street, Culinary Herbs, dried, pressed, and neatly packed, in parcels, at the followingsprices:—Sweet Marjoram, 50 ets—Summer Savory, 25 ets—Thyme, 35 ets—Sage, 17 ets—Celery, (in buttles for soups, &c.) 25 ets—Balm, 33 ets—Rose Flowers, \$1,100. Rose Flowers, \$1,00.

Scions of Apple and Pear Trees. For sale, at the New England Farmer Seed Store, No. 52 North Market street, Boston, a large collection of Apple and Pear Scions,-among which are the following :-

Apples. Gardener's Sweeting, Nonsuch, Grand Sachem, Cat-head, or Large Summer Russet, Rhode Island Greening,

Roxbury Russet, New York Pippin, Baldwin, Gilliflower. White Shropsavine, or ? Early Harvest, &c, &c.

Pears. Heathcot, St Germain, Rushmure's Bon Creticn, Spice Rousselet, Red Bergamot, Moor Fewl Egg, Jargonelle.

Large Iron, or Pound, Gansel's Bergamot. Brown Buerre, Early Juneting, St Michael's, Broca's Bergamot, Bartlett, &e, &c.

In addition to the above, we are daily procuring fine varieties, from responsible sources, and hope to extend the collection so as to comprise all the esteemed fruits raised in the vicinity of Boston and New York,

The scions are in fine order, and the utmost dependence can be placed upon their genuineness, as they are all cut from bearing trees. entf

Alderney Heifer, Saxony Bucks, and Calves of the Short Horn Breed.

For sale, three full blood Alderney Heifers, two years old, two expected to calve in August next, by a full blood Short Horn Bull-three full blood Saxony Bucks, one, two, and three years old-a full blood Heifer Calf, of the Short Horn Breed, four weeks old-a very fine Bull Calf, 3-4 blood, six weeks old, his dam from an excellent native cow, sired by the well-known imported bull Holderness the sire of this call, a full blood Short Horn Bull—the last calf is thought very superior. For terms and further particulars, inquire at the New England Farmer office.

March 5, 1829.

Fruit Trees.

Messrs WINSHIPS respectfully request Messrs will show the may incline to favor those of the public who may incline to favor them with their orders the ensuing season, for fruit and ornamental trees, fancy shrubbery, herbaceous plants, whether indigenous or ex-

otie, to forward their orders immediately, and they will be executed with every possible despatch. They also have several hundred genuine Isabella Grape Vines, by the hundred or single plant, with the superior European kinds in cultivation in this country. Letters directed to F. & I. Winship, Brighton,

P. S. Asparagus roots from one to four years old. England Farmer Seed Store, 52 North Market street, will be executed at the Nursery prices, and the trees delivered in Boston, free of expense for transportation. Brighton, March 11, 1829.

MISCELLANIES.

SONNET TO THE CAMELLIA JAPONICA.

BY W. ROSCOE, ESQ.

Say, what impels me, pure and spotless flower, To view thee with a secret sympathy? Is there some living spirit shrined in thec? That, as then bloom'st within my humble bower, Endows thee with some strange, mysterious power, Waking high thoughts? As there perchance might be Some angel-form of truth and purity, Whose hallowed presence shared my lonely hour? Yes, lovely flower, 't is not thy virgin glow, Thy petals whiter than descending snow, Nor all the charms thy velvet folds display; 'T is the soft image of some beaming mind, By grace adora'd, by elegance refined, That o'er my heart thus holds its silent sway.

Wonders of a cup of Tea .- A cup of tea, though a small article and a cheap one, is capable of performing wonders. As a mine, beneath the wall of a beleaguered city, only requires the match to blow the inhabitants of earth to the moon, so a cup of tea wants nothing but opportunity to produce the most signal effects; and many a match is begun, advanced, or concluded, under its iuspiring influence. When the "hissing urn throws up a steamy column," fragrant with hyson, powerful with imperial, strong with gunpowder, or black with bohea, it may be considered as a warning of the consequences to be expected from the wonderworking beverage within. But when the cups have received it, when the sugar and cream have softened it; in fine, when rosy lips begin to imbibe the delicious draught, then look for consequences. Father of Ho Whanghi! how does a cup of tea unloose, invigorate, nay, almost ercate, the faculty of speech! Behold a spiritless, silent, of a dense and degraded population, which occasolemn company, sitting in a semicircle, staring at one another, having thrice exhausted that most inexhaustible topic, the weather, and despairing in what manner to introduce it a fourth time-in this sad, this most uncomfortable dilemma, the sight of the tea tray is better than a plank to a drowning man, or the voice of pardon to a condemned criminal. Glance your eye over the company, and see how other eyes begin to sparkle; the solemn gloom disperses like mists before the morning sun, But no sooner have pretty noses began to inhale the fragrance, no sooner have pretty lips began to sip the delicious, tongue-inspiring beverage, than silence is thrust aside, the weather banished from " good society," and tongues (as Virgil says about elm trees that bear apples) begin to be astonished at fruits not their own .- Berk. Am.

Behaviour in Company .- Be cheerful, but not gigglers.

Be serious, but not dull.

Be communicative, but not forward.

Be kind, but not servile.

In every company, support your own and your father's principles by cautious consistency.

Beware of silly, thoughtless speeches; although you may forget them, others will not.

Remember God's eye is in every place, and his ear in every company.

Beware of levity and familiarity with young men: a modest reserve, without affectation, is the only safe path-grace is needful here; ask for it; you know where.

Journeyings .- Cultivate knowledge as you travel.

History, antiquities-in cities, towns, churches, castles, ruins, &c.

Natural history-in plants, earths, stones, minerals, animals, &c.

Picturesque taste-in landscape scenery in all its houndless combinations.

Cultivate good humored contentment in all the little inconveniences incident to inns, roads, weather, &c.

Cultivate a deep and grateful sense of the power, wisdom, and goodness of God, in creation and providence, as successively presented to your notice from place to place.

Keep diaries and memoranda of daily events, places, persons, objects, conversations, sermons, public meetings, beauties, wonders, and mercies, as you travel. Be minute and faithful.

Ask many questions of such as can afford useful information as to what you see.

Write your diary daily ;-delays are very preju-You owe a diary to yourself, to your friends left at home, and to your father, who gives you the pleasure and profit of the journey.

Prayer.-Strive to preserve a praying mind through the day; not only at the usual and stated periods, but every where, and at all times, and in all companies. This is your best preservative against error, weakness, and sin.

Always think yourselves in the midst of temptations; and never more so, than when most pleased with outward objects and intercourse.

Pray and watch, for if the spirit be willing, yet the flesh is deplorably weak.

American Freemen contrasted with the largest class of European population .- There do not exist in America, in the same degree those circumstances sion in the old nations of Europe such an infinite difference of knowledge and ignorance, of wealth the most exuberant and indigence the most horrible. No man in America need be poor if he has a hatchet and arms to use it. The wilderness is to him the same retreat which the world afforded to our first parents. His family, if he has one, is wealth; if he is unincumbered with wife or children, he is the more easily provided for. An immense proportion of the population of the United States consists of agriculturists, who live upon their own property, which is generally of moderate extent, and cultivate it by their own labor.-Such a situation is peculiarly favorable to republican habits. The man, who feels himself really independent,-and so must every American who ean use a spade or an axe,-will please himself with the mere exertion of his free-will, and form a strong contrast to the hollowing, bawling, blusteriug rabble of a city, where a dram of liquor or the money to buy a meal, is sure to purchase the acclamation of thousands, whose situation in the scale of society is too low to permit their thinking of their political right as a thing more valuable than to be bartered against the degree of advantage they may procure, or of licence which they may exercise, by placing it at the disposal of one candidate or another .- Scott's Life of Napoleon.

The Traveller states that during the last year, in Boston, about 400 dwelling houses and stores were built, besides three meeting houses, a splendid hatel, and a number of mechanics and other

SEEDS WHOLESALE AND RETAIL

BOSTON, FRIDAY, MARCH 27, 1829.

No. 36.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

ON STALL FEEDING CATTLE.

MR EDITOR-Most persons are willing to communicate the result of those experiments only, in which they have been successful. Those in which we fail may be made equally useful, as pointing out to others the rocks on which we have been wrecked, and giving fair and seasonable warning of the dangers of the navigation. Under pecuniary loss and disappointment, we ought, at least, to be allowed the consolation and relief of making our mistakes admonitory and beneficial to those, who might be otherwise in danger of suffering from the same causes with ourselves.

I have been curious to know, since the great articles of agricultural produce this year have been as cheap with us in this vicinity as they ordinarily are far back in the country, why we could not stall-feed cattle here to advantage, if it is true that the farmers in the country find it for their advantage to fatten beef by stall feeding for the market? I exchanged a yoke of oxen in low condition in the fall, for a yoke of larger cattle, in such a thriving condition as several good judges pronounced most favorable to success in the experiment.

My own cattle were sold again by the purchaser, in the way of trade for sixty dollars; but he estimated the cash value at fifty-five. I gave in exchange for the cattle to be fatted, ten dollars. which made the cost of the oxen stall-fed, sixtyfive dollars, when their feeding began. This was the first of December, and they were slaughtered | lb. he receives \$27,69. This seems to me a large the 26th of February. They were kept clean; commission, and very disproportionate to the redaily carded, and fed at regular hours with as much care and fidelity as possible. They were eighty-eight days in the stall, being turned out once or twice a day for watering; and the food consumed, and the result, are as subjoined.

73 bushels of turnips, or mangel wurtzel, at 10 cents per bushel.

1024 gts of Indian, or oil meal (at 28 qts to a bushel, deducting the toll,) equal to 364 bushels, at 60 cents per bushel.

654 bushels of potatoes, at 25 cents per bushel,

Hay not ascertained, but estimated for both, at 25 lbs. per day, at 50 cts per 100 lbs. 2200 lbs.

Cost of feed, Value of the oxen when put up,

Weight when killed 1846 lbs. for which the butcher allowed me 5 cts per lb.

Loss on the oxen,

\$29,261 mistake was in using so many vegetables, and that whether, on a large scale, it can be made better. of it, and have often made less. I should have given them only hav and Indian In the spring, lean cattle, as steers and oxen, may peck of meal each per day. The loss then would being kept in good pasture all that time, they will ing? We must first know what an ox requires to

losing concern, as may be seen by a calculation. they cost? An ox, on the 15th of May of mod-

Cost of the oxen, 11,00 Hav,

½ bushel of corn per day, for 88 days, is 44 bushels, at 60 cts,

Proceeds of the sale,

Loss by this feeding,

\$10,10 But it is by no means certain that by this mode of feeding they would have gained as much as by the mode adopted. Of this, however, I am not

102,40

92,30

able to form an opinion. The cattle fed as well

as possible from the beginning. This result, though by no means agreeable, corresponds perfectly with the statement on the same subject, of a "Gentleman of Columbia," in vol. ii. p. 221, of the New York Memoirs of Agriculture, which I should be glad to see republished, in part,

in your useful paper. I have been solicitous, in the next place, to ascertain as near as practicable, what are the ordinary profits of the butcher in such cases. Several have admitted that the advance which they receive is from one to two cents per lb. The butcher, to whom my cattle were sold, an honorable and fair man, said that he should be satisfied with the hides and tallow for his profit. The hides at 5 cents per lb. and the tallow 51, (the ement prices) would bave given him \$18,77 .-Or rating his profits at one cent and a half per sult with the farmer, who loses above 29 dollars, while the butcher gains, probably above 27 dol-

lars, with comparatively little trouble. I leave all remarks in this case to others,-and am, Mr Editor, Yours respectfully,

March 7, 1829.

Remarks by the Editor .- The following is a part of the article alluded to above by our correspondent, and which he would " he glad to see republished," &c. "We all know that selling lean cat-16,314 best, even when they can be sold at all; and the only way to obtain anything like a fair price, is to get them ready for the butcher as early as possithere is generally a demand by those who retail them in the country villages and towns; poor enough to be sure is the meat, but it goes by the name of beef. To keep on hand this kind of supplied, they will seldom pay for their keeping. As an article of agricultural profit, it will never Such is the result of the experiment, conducted do; as a matter of convenience and necessity, we

have been less, but still it would have been a be fat, or at least in good order. Now what have 65.00 erate size, will cost, on an average, \$25; keeping till the 15th of November, will not be less than \$I per month, that is \$6; expense of sending to market, 100 miles distant, \$2,50; interest on the purchase money, including risk, at 10 per cent. is \$2,50 - then your ox has cost \$36. He will not sell at that season for more than \$40-a poor profit indeed of \$4. This article will then seldom answer, unless where land is at a low price, and very distant from market. I have known several trials made, and by attentive experienced farmers, who have, after a year or two given it up.

Let us next examine whether winter stall feeding will do better. If cattle are in very good order, or half fat, the 1st of December, they may be made fit for market in three months, and feeding for that time will cost \$25. If they are in ordinary store order, it will require six months, feeding, which will cost at least \$30. Now it is easy to calculate whether the price you will then obtain for them will pay the first cost, risk, interest, and expenses; if so stall feeding will do, otherwise not. My own experience has taught me that it will not do-others will judge for themselves.

* "When the farmer or grazier undertakes to make the fattening of cattle his business, the first prerequisite is, that he be a judge, and a good one too, of the worth of cattle in all their different stages, of which he judges by the eye, and hand; next he must have at command a capital in cash, to enable him to buy with most advantage; and then he must have provided food in sufficient quantity for whatever mode of feeding be undertakes. Fattening on grass, or in the stall, are the two modes of managing this business; on grass the best way is to buy young cattle, particularly three or four year old steers, in the month of November; to keep them in the yard all winter, fed partly with straw and partly with hav, but so as to have them in good order in the spring; and these cattle should not be of the largest sizes, rather middling, such as will come to about six hundred weight the four quarters when fattened. Such may generally be bought for \$20 or \$25 .tle, either in spring or fall, is a poor business at They must have good pasture for four mouths, for if that fails, the profit is gone. But as we cannot control the seasons, in case a severe drought takes place, the only remedy is a little grain, or rather ble. If they are in good pasture from the middle meal, given daily. Provided they are thus fed, of May to the middle of August, they will sell, as they will be ready for sale by the middle of September, and generally at this time cattle of the above size are in good demand; if kept later, the markets are glutted, and the price always lower.

"The middle of September, such cattle, weighstock for three months longer, that is to the mid- ing 600 lbs. the quarters, will not sell for more dle of November, when the markets are so fully than \$36, or \$6 per 100. They have cost, first \$20, next, winter keeping, hay \$2,50, straw \$2,50, four and an half month's grass \$4,50, interest for ten months on \$20, at 7 per cent. \$1,16-then for aught I see, as fairly as possible. Some of my must make use of it. If then, in a domestic way, the profit is about \$5,-besides the risk. This is neighbors, upon seeing the issue, told me that the this turns to so little profit, let us next examine no great encouragement, yet I can make no more

" In pursuing this subject, we now inquire what meal; --say as much hay as they would eat, and a generally be purchased low, and in six months, is the most economical and profitable winter feed-

in three months, or 100 days, if in good store order when put up. Let this time be allowed. He will eat every twenty-four hours, 14 lbs. of hay, cost 6 cents; half a bushel of potatoes, 121 cents, and eight quarts of Indian meal, 121 cents; being 31 cents a day, or \$31 for the 100 days. This I have verified by many trials; and the interest \$1,75, together making \$32,75, which added to the first cost, \$25, then the ox has cost \$57,75. If the beef is sold at \$8 per cwt, in March, it leaves only \$6,25 profit. There are several other articles of food on which cattle may be fatted; but the above is the most economical that I know .-Oil cake is the quickest to fatten with, and where it can be had, it is advisable to use it instead of Indian meal; the price is about 56 cents per bushel, ground, and the quantity from 4 to 8 quarts per day.

"To fatten an ox on turnips will require two bushels a day, with 10 lbs. of hay. Carrots answer well, but are more expensive still-cabbage the same. From all these we exempt premium cattle, and those made up for show. Sure I am that the feeder never gets paid, unless he is gratified with seeing his oxen dressed up with ribbons, and his name in the papers. It was told me as a fact, that one gentleman from Orange county, who had just sold in New York ten very fine cattle, being asked how much profit he had made by these, as they had been fed eighteen months, answered, he had just made a loss of \$30 a head, although they were sold at a high price. Where then go all the profits, for beef is still at a good price when cut up? The answer is to the butcher, who realises from 25 to 30 per cent. on good cattle."

We doubt very much whether stall feeding cattle can ever be made profitable in the vicinity of large markets; for this plain reason, the articles of produce, which are required for fattening the cattle, would command more money in market than their value when turned into beef by any mode of feeding with which we are acquainted. But when farmers live at such a distance from market that their potatoes, turnigs, and other articles of that kind are of too great bulk and too little proportional value to bear transport to some place of profitable sale, they may advantageously change those articles into beef by fattening cattle with them. Likewise where farmers are in possession of rich pasture grounds, it will often happen that their produce can scarcely be turned to good account in any other way but by its use in fattening cattle. Besides a small farmer even in the immediate neighborhood of a good market may profitably fatten his old oxen without their consuming any considerable quantity of marketable produce. By permitting them to have the first run of his spring pastures, and of his rowen, or aftermath; the first bite at the balks of his corn field; the tops of his garden and field vegetables; the thinnings or extra plants or leaves of Indian corn, turnips, mangel wurtzel, &c. with such additions of Indian meal, green corn, grass cut with the scythe and fed out green, refuse pumpkins and squashes, sweet apples, &c. &c. as prudence may suggest and economy justify, a small farmer may fatten a voke of oxen, or a cow or two, at an expense so trifling as to realize a palpable profit.

fatten him, suppose he will give 800 lbs. of beef, convert them into fat beef. But to buy produce more than a thousand bunches, without any re-It has been already said that he may be made fat to fatten cattle, is like pumping up water to carry a grist mill—the thing may be done, but will cost sirous of trying for similar success in their own more than it will come to.

FOR THE NEW ENGLAND FARMER.

NATIVE GRAPES.

Ma Editor-As new fruits are presenting themselves, and information respecting their qualities desirable, I hope a few remarks, on our native grapes, those varieties suitable for the table, and for wine, will not be ill timed.* We recommend our remarks to those who cultivate fruits in open situations. The Black Hamburg in my garden, does not ripen successfully, once in six years in open ground-the Sweet Water has failed six years in succession-latterly they have done better, but are still a very uncertain fruit. The hardiness and certainty of the native grape crops, urges us strongly, to cultivate them largely. In a few years, I have no doubt, in the country, we shall find the greater proportion of cultivated grapes native sorts. I noticed last fall, that the cultivators of fruits, in the vicinity of Philadelphia, were giving up foreign varieties, owing to their frequent disappointments in good crops, exchanging them for our native varieties, particularly Alexander's, or Schuylkill Muscadelle-their general market price was nineteen cents the pound,

BLAND'S MADEIRA, OF VIRGINIA, OF PALE RED. This variety has been raised last season, on the rich farm of EBEN, SEAVER, Esq. in Roxbury, presented in our market and sold readily for twentyfive cents the pound. Their fine appearance was such, as seven out of eight would have declared them a fine, foreign, table grape. A handsome bunch of the same, was at the time, to be seen at the New England Farmer office. It was only my save to the cultivators of fruits the trouble many positive declaration, that I knew them to be native, that could convince a noted gardener in Boston they were so. This fruit has the credit of standing first as a dessert grape, and is also a superior wine grape. The vine is vigorous, hardy, and a good bearer-bunches large, six or eight inches long, with handsome shoulders or branches, berries good size, claret color, thin skin, very little pulpy, good flavor, juicy, sweet, and lively, a very little of the native taste about them.

ISABELLA-Much has already been said in favor of this variety, which is a valuable acquisition, when we consider its many good qualities, its great yield, (more so than any others known here) vigorous growth, hardy, and certain crops-a good wine grape; many will like it, as a dessert grape, as it is ascertained that by hanging them in a room, they lose the foxy taste attached to them, becoming juicy, and more palatable. No one, I think, could withhold from their gardens in the country, these native varieties, when they are so certain to bear well, requiring no trouble, except keeping them well pruned. No protection is necessary from the cold. Let every one witness, as I did last fall, Messrs WINSHIP's, of Brighton, five years old vine, on which were three hundred fine bunches of grapes. Also in Mr Shaw's fine garden in New York city, a nine years old vine, covering the whole front and top of a piazza, loaded with fine grapes, estimated to be over two thousand bunches. Likewise in Brooklyn, Long Island, a nine years old vine, spreading over a tree with

cent pruning. I should think all would be degrounds; we must, however, remember they grow in proportion, as the soil is good, where they are placed. This variety was only introduced since

CATAWBA-This variety I have not seen, but those whom I consider good judges speak very favorably of it. Mr J. Adlum, one of the greatest cultivators of native grapes, says "I look upon this as one of the best wine grapes in the United States; and I say the very best. It is a very tolerable table grape. Those that ripen in the sun, are of a deep purple color; where they are partially shaded, they are of a lilac color; and where they ripen wholly in the shade, and are perfectly ripe, they are white, rich, sweet, and vinous .-When they are colored, they have somewhat of a musky taste, resembling the Frontignac-they are very great and certain bearers."

ELSINBURG, OF ELSINBOROUGH-This grape Mr Prince describes as follows-a very sweet, juicy fruit, of a blue color, very hardy, and very productive-free from pulp, and musky taste, &c. I have heard it spoken of as a fine grape, and suitable for the table. S. DOWNER.

Dorchester, March 23, 1829.

FOR THE NEW ENGLAND FARMER.

TO THE LOVERS OF GOOD FRUIT.

A synopsis of a work on fruits and fruit trees. which was published in the New England Farmer the week before last, principally drawn from the Treatise of Mons. Duhamel du Monceau, has probably fallen under your view. The motive for publishing this work is two fold-first, a desire to of them are now at in inquiring weekly of periodical writers, what course they ought to pursue in the treatment of their fruit trees, under different circumstances, as well as the management of their fruits; and, secondly, from a desire which we have long felt of remedying in some measure. if possible, an evil which now pervades this country, in regard to the nomenclature of fruits generally, and particularly pears, which have of late years become an object of considerable interest among a large and respectable class of our citi-

Almost every man who has land of his own, on which he wishes to raise fruit trees, is desirous of establishing such sorts in the first instance, as will he permanently acceptable to his family and friends, or profitable as a means of support. It is therefore of much importance to him that he be supplied in the outset with such sorts as will answer one or both of these objects. Hitherto the confusion of names has been so great, and the care of individuals so small, that many gentlemen have been led into great expense, and have experienced great disappointments by inserting grafts and planting trees that have been sent them as one kind of fruit, while they were in fact of a distinct and entirely different sort. The expense, which is to many persons an object of importance, is nothing, however, in comparison with the loss of time which follows before the error is detected. Three or four, and sometimes five or six years pass away before we have ascertained that we have been nourishing and cherishing a being in which we have no interest, and which, as soon as its charac-

Mr Braddick sent two of the pears to Mr Loudon, who prenounces them excellent. This was on the first of March. Braddick says he kept them back as long as he could. He adds his own ideas as to the mode of keeping pears well. "They should be preserved in an equal dry temperature; under the fermenting point from whence they should be brought out just at the time of using them. Acting upon this experience I have prepared a fruit solid dry rock." We would not recommend others to follow this expensive example, but the opinion of a very experienced cultivator as to keeping fruit at a low and unvarying temperature is of great value.

On the 8th of April, 1826, Mr Braddick sent to Mr Loudon three pears of the year before, of course excellent keeping pears, of which the only

notice is as follows.

Surpasse St Germain-large brown and green

J. MURRAY, F. L. S.

An Initiatory Discourse, delivered at Geneva, 27th Society of the western parts of the state of New York. By Myron Holley, Esq.

(Concluded from page 276.)

In 1805 a private association for Horticultural objects was commenced in London, which was incorporated by a royal charter, in 1809. In 1803, in Edinburgh, a Florist Society was instituted, which, in 1809, enlarged its views and took the title of the Caledonian Horticultural Society. At Paisley, in Scotland, a Florist society, was, some time ago, established, of which an eminent writer observes, that "the rearing of beautiful flowers is found to improve the taste for manufacturing elegant patterns of fancy muslin; while the florists of Paisley have been long remarked for the peacefulness of their dispositions, and the sobriety of their manners,"

Several Botanical and Horticultural societies have been commenced in the United States, some of which are rapidly advancing in importance and sential to comfort, as well as those which minister fierce contentions of a stormy world; and inspire respectability. The influence of them collectively, and of their several scientific and public spirited members, individually, has been very perceptible in awakening a general desire for the improved cultivation of gardens and pleasure grounds, and an increasing love of rural pursuits. One of the most useful of these is, the New York Horticultural Society, which was originally formed in 1818, though not incorporated till 1822. The effects of this Society are most agreeably manifested in the superior quantity and quality of culinary vegetables, fruits, and flowers, to be found in the New York market; in the emulation excited among actual cultivators; in the valuable practical publications, upon gardening and planting, which it has encouraged, and in the public discourses of several of its most intelligent and accomplished members. With these societies, I trust, the institutions which we are now assembled to originate, will become an active and useful fellow laborer.

The benefits of such associations are numerous and of great importance,

They encourage profitable industry. In the vicinity of London there are occupied as fruit and kitchen gardens, about 14,000 acres of land, of which the annual produce is sold for more than \$4,000,000. Within six miles of Edinburgh, there are computed to be 500 acres, occupied in the same way, of which the annual produce is worth near 100,000 dollars. For the supply of the New York market with vegetables, fruits, and flowers, land, of which the aggregate annual produce, in the market, is supposed to be near \$400,000 .-The portions of earth thus cultivated, are far more productive than any other equal portions of land in the countries where they are situated. And they give a healthy and virtuous employment to great multitudes of human beings.

They promote important practical knowledge, viously followed, from some of which advanta- who have been able to indulge their taste for ornabe shared by the whole community.

on that day, was formed the Domestic Horticultural and most desirable consequence of this will be, farewell to the garden of Eden. that we shall obtain a complete acquaintance with all our indigenous vegetables. From the east and from the west, from the north and from the south, our native plants will all be gathered. Every swamp, and every valley, every plain, and every mountain, which is surveyed by the American eagle, in his widest flight, will be made tributary, with all its vegetable wealth, to the great interests of science and humanity.

The science of Horticulture is capable of great improvement, even in those countries where it has been most sedulously fostered. Recently, by the application of scientific ingenuity, better apples and pears are said to have been originated in England and Flanders, than any before known .-And those countries, now vastly in advance of us in Horticulture, are making new discoveries and acquisitions from year to year. The finest fruits and plants we now cultivate; those which are esto luxury, are not natives of our country. Our potatoes, peaches, pears, and the better kinds of plums, cherries, and apples, have been all brought to us from abroad. And we are not yet in possession of a tithe of the nutritious and desirable fruits and plants with which the earth is stored .-In relation to all these, inquiry and competition, suggested and aided by the combined intelligence, applause, and other rewards of public associations, will be beneficial. By these means an extensive acquaintance with the most esteemed Horticultural productions, of every country, will be obtained; and the most sagacious and persevering use of all the means necessary for their acquisition, will be adopted. Calling in the aid of men of science, of amateurs, and enlivators, both at home and abroad, such societies may become the fortunate instruments of disseminating, universally, every valuable seed, and plant, and tree, which is borne upon the prolific bosom of the earth.

The tendencies of such associations are all liberal, and philanthropic, and social. By uniting gentlemen of all classes, professions, and opinions in the prosecution of interesting and commendable objects, the amiable and elegant courtesies of life will be extended. Their stated meetings will be finement; and all will go away from them with a keener relish of the beauties of nature, and a more cheerful devotion to rural employments.

there are cultivated several thousand acres of nature, they are calculated to improve the conduct our essential wants, our habitual comforts, and ing, and the gravity of declining, life. How much clamorously, but silently and most attractively, to the pure attachment to home is strengthened, in those reflections which improve the heart. the hearts of children, by uniting their exertions, will soon learn the value of the shady walk, the the world !

They create a new spirit of horticultural and bursting bud, and the fragrant arbor. One of the November, 1823, before an assembly, from which, botanical enterprise. In our country, a necessary most pathetic passages of English poetry, is Eve's

> " Must I thus leave thee, Paradise? thus leave Thee, native soil! these happy walks and shades, Fit hannt of Gods? where I had hope to spend, Qu'et though sad, the respite of that day That must be mortal to us both. O flowers. That never will in other climate grow, My carly visitation, and my last At even, which I bred up with tender hand From the first op'ning bud, and gave ye names ! Who sow shall rear ye to the sun, or rank Your tribes, and water from th' ambrosial fount? Thee, lastly, puptial bower! by me adorn'd. With what to sight or smell was sweet! from thee How shall I part, and whither wander down Into a lower world; to this obscure And wild? How shall we breathe in other air Less pure, accustom'd to immortal fruits?"

To old age the employments of Horticulture are delightful and appropriate. They afford a secure retreat from the noise, turbulence, ingratitude, and screnity and cheerfulness. Cicero, in his letters to Attieus, speaks of them as the best remedy for grief and concern of mind. In a thousand ways a garden serves to keep fresh and elastic the springs and sympathies of life. The heart finds interesting remembrances, and soothing society, in all its objects. That shade is most refreshing, which is afforded by trees of our own planting: that fruit is most delicious, which we have most frequently participated with our friends: those flowers have the brightest bloom, which have been the joy, and the ornament of our wives and children.

Horticulture is favorable to universal charity, to virtuous reflection, and to the highest attainments of which the soul of man is capable. Surrounded with fragrance, and harmony, and beauty, and order, all giving witness to the attributes of their Great Creator, that heart must be dreadfully perverse which is not spontaneously filled with gladness and gratitude for such accumulated blessings. And these sentiments naturally dispose us to regard, with the most cordial complacency, all the works of the same hand.

Of all organized beings, trees, and leaves, and flowers, appear to me to afford the most obvious embellished by taste, intelligence, and festive re-traces of the intelligence and goodness of God .-A very small portion of knowledge and curiosity is sufficient to discern the marks of design in their structure; and still less, to apprehend the tenden-By promoting the knowledge and the love of cy of that design. From the Southern Agriculturist.

An Account and Description of Bishop's Early Dwarf Protific Pea; by MICHAEL FLOY.

The letter given below was written at our request, and accompanied some of the neas ordered out by us. An account of their origin is given in the first volume of the Gardener's Magazine, and from observations made by the Conductor of that work, in subsequent numbers, they are in high repute around London; supposing that they would prove an acquisition here, we have given the aunexed letter .- Editor Southern Agriculturist.

New York, Dec. 27, 1828.

Sin-I send you the quantity of Bishop's Early Dwarf Prolific Pea, ordered by you, being of the same kind as presented by me to the Horticultural Society of this city. Agreeably to your request, I will give you a short account of its origin, peculiar properties, and mode of treatment. In the year 1826, they made their first appearance in the largest leaves, but am careful not to disturb Loudon, having been sent, as I am informed, from some part of Scotland, where they were originally raised by a practical gardener, of the name of Bishop. In the year 1817, so great a reputation had they obtained in the neighborhood of London, that they were readily sold by the nurserymen there at a guinea a pint; and in the spring of that year I received a small portion of them as a present from an eminent horticulturist, who, in the letter accompanying them writes as follows: "These peas are making a great noise here, and knowing they would be highly acceptable to you, I have, with some difficulty, procured you a small quantity: its peculiar excellences appear to be the most wealthy and respectable citizens of that these-its great productiveness, equalling if not surpassing any variety hitherto known; its earliness, and its remarkable dwarf habit, seldom attaining, even in the best soils, the height of twelve inches, which of itself would make it a most valuable acquisition, more especially for small gardens." In addition to what is here stated, I remark from my own experience, that this pea fully realizes the description here given, and the following appears the most judicious method of treating them: they should be planted three, or at any rate highly beneficial, not only to Albany and its vicintwo inches apart in the rows, as from their dwarf- ity, but to the State at large. - Ibid. ishness and spreading habit they do not do so well if sown closer, hence it is obvious there will be a great saving of seed, as a pint of these peas will go as far as two or three quarts of any other, sown in the usual manner. They commence blooming when not three inches high, bear most abundantly, and are very fine eating. If a few were planted weekly, a constant succession of green peas might be obtained all the summer and autumn, as from the habit of their growth they appear better calculated to withstand the heat of an American summer than any variety with which I am acquainted. I have still a few quarts left, which are offered to those desirous of cultivating an excellent vegetable, at one dollar per quart. Persons at a distance, by remitting the cash by letter (post paid) will receive them by any conveyance they may MICHAEL FLOY. designate.

TO JOHN D. LEGARE.

(F A few quarts of this pea have been received at the New England Farmer Seed Store, and are offered for sale at the New York price-\$1 per quart-though we know nothing farther with regard to their character, than what is mentioned above.

From the New York Farmer.

CHEAP METHOD OF FORCING RIIU-BARB.

My rhubarb plants grow on an east border, a few feet from my barn and stable door, separated from the latter by a fence-the soil therefore very rich. In March, or sooner if I please, I place an old flour barrel, having but one head, over each stool or plant, the head uppermost to the extent that I wish to force. I then with a dung fork proceed to cover the barrels and to fill the intermediate spaces with fresh stable dung, to the thickness of a foot or more all round and above the casks. A fermentation soon commences, and the heat thus generated, the atmospheric air being excluded from the casks, soon causes the plant to grow vigorously, and in two or three weeks the barrel becomes literally filled with fine blanched, semitransparent leaf stocks of the rhubarb. I carefully remove the manure, raise the barrel, break off the crown, and then replace the cask and manure for a second crop. I have in this way taken enough from a single plant, in April, for ten or a dozen pies. The leaf stocks thus blanched, require no pealing. They are very brittle and juicy, and require to be merely washed and cut to prepare for cooking. Sea Kale is forced by the same process. J. B.

Albany, Feb. 1829.

ALBANY HORTICULTURAL SOCIETY.

A correspondent writes, that the Society is likely to receive the countenance and patronage of place; and its members are flattering themselves with the hope, that the corporation of the city will consent to appropriate the ground of Washington Square for a Botanic and Horticultural Garden .-This square comprises thirteen acres, and is beautifully situated on the height of ground, half a mile west of the river; and extends in a parallelogram from State to Lydeus streets. Should the anticipations of the members, in obtaining the ground, be realized, the results would, undoubtedly, be

The Cinnamon tree, (Lurus Cinamomum) we learn has been raised in the open air, in France. M. Boursalt made a report to the Horticultural Society of Paris, on the subject. The young plants had been kept in the Conservatory for a short time. They had been sent, at the time of the report, to Toulon, where it was thought the probability of succeeding would be greater.

Siberian Rice.-In Russia, a kind of Rice is used which grows in Siberia, and is more succulent than that of America. It may be useful, and I am desirous of inquiring about it .- Rusticus in

The Manufacture of Sugar from the Beet Root is said to be on the increase, and though the Sugar of the Colonies is always somewhat cheaper in the Netherlands than in France, is said to pay the manufacturer. It is stated, however, that a profit is more certain where the manufacturer is also the grower. A part of the advantage arises from giving the leaves and the refuse of the manufacture of the root to cattle, and from the quantity of manure produced .- Jour. d'Agriculture des Pays-

A simple and effective Remedy for the Sick Headach .- A few days ago my partner was laboring under a very severe sick headach, when a friend called, whose attention has for many years past, been confined altogether to the study of chemistry, in connexion with a prefitable business in which he is engaged. The gentleman, observing my partner indisposed, inquired the cause; and on ascertaining it, immediately offered to cure him by a very easy and pleasant process, in less than an hour. The offer was accepted; half an ounce of citric acid was sent for, which cost only a few pence; three or four small lumps, each the size of a pea, were dissolved in cold water and drunk. The beverage is an agrecable one, very like the taste of lemonade, being, I believe, used in making this pleasant cooling liquor. In less than half an hour the patient was able, without any inconvenience, to attend to his business again as usual, and in another half hour he was well as ever.

Improvement in Lamp Oil .- Those vegetable oils, which can be obtained sufficiently cheap for light, have not, heretofore, been used on account of their glutinous qualities, and the smoke produced in combustion. A recent discovery has been made in freeing it from its glutinous properties, so that it burns as free and clear from smoke and smell, as the best of lights now in use. Among the vegetable productions that may be profitably cultivated for this purpose, are the large white poppy, one bushel of seed yielding two gallons of oil; the American rape, producing fifty bushels of seed to the acre, and five quarts of oil per bushel; the sun flower, growing about five feet high, and very abundant in seed and oil: and the cotton seed, vast quantities of which are known to be raised to the south, and hitherto of little value, but now, by this improvement, may be made to produce an income to the planter.

Exportation of Bones .- Some idea may be formed of the value placed on manures by English tarmers, from the fact that all kinds of bones, exported from this country to Great Britain, afford a great profit. We are not able, at present, to state the quantity that is exported, but presume it must be considerable, as they are brought from a distance up the North River, and shipped at this

There are bone mills in various parts of England, particularly in Derbyshire, where the fartoers are distinguished for their intelligence and enterprise. These mills are "composed," says Loudon, " of ratchet-like iron wheels and rollers, between which the back bones of horses, with their adhering ribs, pass with facility, and are crushed into small pieces."

Lapland Cows .- The cows in most parts of Lapland are all of the same white color, and very little larger than suckling calves in England; but exceedingly beautiful, and yielding milk of so superior a quality, that it becomes almost wholly cream, and that of the most delicious sweetness, while, when even fresh, it is so coagulated, that a spoon will nearly remain upright after it bas been plunged into it .- Imperial Magazine.

Hops .- From the report of E. A. Le Breton, inspector of hops in Albany, made to the Legislature, it appears that during 1828, he inspected 1,263 bales of hops weighing 277,502 lbs., raised in the following counties; Madison, 151,268; Ot4,329; Columbia, 2,616; Monroe, 2,369; Franklin, 2,336; Oneida, 76,366; Saratoga, 990; Chenango, 925; Oswego, 347; Benington, Vt. 527. &c. as is much the practice among our farmers.-The amount of fees is \$277,50. The inspector says the raisers have done their work much better the present season, and the hops have gone into market a much better sample than for years back. The average price of hops has been about 9½ cts. per pound. This low price has partly been occasioned by the large quantity remaining in store, of the previous year's growth, and partly from the depression of the brewing business in Entomology, &c. this state. Alb. Adv.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MARCH 27, 1829.

MASSACHUSETTS HORTICULTURAL SO-CIETY.

The members of the Massachusetts Horti-CULTURAL Society, are hereby requested to pay to the Treasurer of said Society, their fee of admission, being five dollars each, agreeably to a provision of the By-Laws.

CHEEVER NEWHALL, Treasurer, No. 15 South Market Street.

NOTICE

A special meeting of the Massachusetts Hor-TICULTURAL SOCIETY, will be holden at the office of ZEBEDEE COOK, Jr, on Tuesday the seventh day of April next, at 12 o'clock, for the admission of members. R. L. EMMONS.

Recording Secretary.

Mr Loudon, the indefatigable author of the Encyclopedias of Agriculture and Gardening, is preparing a new work, entitled an Encyclopedia of Plants, in one large volume, with 7000 engrav-

Dr Richardson is preparing Notices of the Quadrupeds, Birds, Fishes, and Insects, inhabiting British North America, and the country traversed by the late expeditions under Capt Franklin.

Sir Walter Scott has in press, a new work, entitled Essays on Planting and Gardening.

SCIONS OF NEW FRUIT.

[Extract of a letter to the Editor of the New England Farmer, dated Wrightsville, Pa. The scions, generally, arrived in good order. A part of them have been presented to the Massachusetts Horticultural Society, for gratuitous distribution among its members, and are all disposed of.]

I herewith send you a few grafts from an apple tree which is here called the German Sweet, or Winter Sweet Paradise. Its origin I have not been able to trace. The color of the bark is dark, and unusually smooth, and free from blemish. The young trees from the nursery, although well proportioned as to taper, are generally as straight as fishing rods; and the limbs, as the head begins to form, are disposed to grow like the Lombardy Poplar tree, until their inclination is altered and the head of the tree spread by sustaining a load of fruit. The fruit is about the size and color of a Yellow Newton Pippin (perhaps a very little paler) with a fine blush on one side, the skin smooth .-The taste very agreeably sweet, and the flavor, to me, more like a fine pear than an apple. It ripens late and keeps well. The dried fruit (or snits* as

* Snits, from schneid, to cut, German.

superior in richness to any I have tasted, when stewed and served up at dinner, with pork, bacon, Should they arrive in good order, and, from the description, be a kind you are not already in possession of, I desire, if acceptable, that you give two or three grafts to the Hon. John Lowell, and after belping yourself, if you cultivate fruit, dispose of the rest as you see proper, perhaps, not forgetting Doct. HARRIS, to whom we are likewise already under obligations, for his publications on

To Select Apple Graftings .- Apples containing a large portion of saccharine matter, will make cider, that will preserve the longest. This property strong solution of salt and water; the poorest sort reduced catalogue prices. will keep nearest to the surface. In this manner graftings can be taken from the best sorts.

Mammoth Hog .- A hog, about eighteen months old, which had been fed altogether on stillslop, was killed on the 3d inst. at the distillery of Mr Jacob Weltzhoffer, in Hellam township, and weighed 525 pounds-beat this .- York, Pa. Recorder.

Greenwich Flower Garden.

faction that former importations have done. Also on hand, a choice collection of greenhouse and bardy herbaceous plants, (many of which are very rare;) rose bushes and other shrubs, in great variety, truit trees, white mulberry, &c. Plants of artichoke, asparagus, sea kale, early frame potatoes, mustroom spawn, &c, with directions for cultivation. The Hyacinthus, Crocus, Nar-cissus, &c, are in bloom, and will continue in succession a great part of the year. Catalogues may be had at the garden. Orders left at the garden, the post office, or with Mr Molyneaux, corner of Broadway and Ann street, will he strictly attended to. Gentlemen supplied with expe DANIEL KENNEY, rienced Gardeners.

Carmine and Varick streets, New York. The nearest route to the Garden, Greenhouses, and Seed Store, is from Broadway, by St Thomas's Church, along Houston street, or along Canal and Varick streets. eop8w

Fruit Trees, &c.

Russell, No. 52 North Market Street, Boston, and at the Nursery in Newton.

Bees.

Just published by MARSH & CAPEN, 362, Washing-

ton Street, A PRACTICAL TREATISE ON THE MANAGEMENT OF BEES; and the establishment of a Piarie, with the best method of destroying and preventing the depredations of the BEE MOTH. By JAMES THATCHER, M. D., Fellow of the American Academy of Arts and Sciences, &c.

Extract from the Author's Advertisement.

"The destructive ravages of the BEE MOTH have in many places almost annihilated our Bee establishments, and discouraged all attempts to renewed trials. Not less than one hundred hives have, the past season, been entirely destroyed by that enemy, within a few towns in the county of Plymouth, and in places where a single hive has yielded one hundred pounds of honey. From a particular investigation of this subject, the compiler is now able, with much confidence, to announce, that an effectual preventive of such depredations will be found recorded in this production." Prace 75 cents.

March 27 3t

March 27

Red and White Clover Seed.

For sale at the New England Farmer Seed Store, No. 52 North Market Street, 5000 lbs. Red Clover Seed,

500 lbs. Dutch White Honeysuckle Clover, (imported.) Also, Herd's Grass, Red Top, Orchard Grass, Lucerne Foul Meadow, Hemp and Flax Seed, &c, &c.

MISCELLANTES.

From the N. Y. Enquirer.

THE WOODPECKER.

The pye-bald woodpecker, with sturdy beak, Will, buoyant, pierce the beech in quest of prey, And make the hamlet echo with the stroke. Yet not the healthful trunk will be assail, But one that's girdled, thunder-smote, and dry, Whose vital sap is neutralized and thin, Extracts from rottenness unnumbered worms. Behold you oak, the victim of a blast, It fell when Boreas in a partial rage Condensed his force to lay the giant low; While shrubs, less arrogant, though less renown'd, Escaped th' appalling terrors of the gale. So't is with man, who envies those more high, More palpable to demolition's dart, While he, in insignificance, is safe. flumility 's the sentine! of peace. Look at Jove's tree, now withering at its length; The fallen Polyphemus of the grove, How like a prodigal bankrupt he appears, Crushing the sapling 'neath his ample sides.

SELECTED FOR THE NEW ENGLAND FARMER.

MR EDITOR-If the following selection is worthy a place in your paper, you will please to give it room, and oblige A SUBSCRIBER. Weston, March 3, 1829.

Rules and Maxims for Promoting Matrimonial Happiness .- The likeliest way either to obtain a good husband, or to keep one so, is to be good yourself.

Never use a lover ill whom you design to make your husband, lest he should either upbraid you with it, or return it afterwards; and it you find at any time an inclination to play the tyrant, remember these two lines of truth and justice:

- "Gently shall those be ruled, who gently sway'd,
- " Abject shall those obey, who haughtily were obey'd."

Avoid, both before and after marriage, all thoughts of managing your husbaud. Never endeavor to deceive or impose on his understanding. nor give him uneasiness, (as some do very foolishly, to try his temper)-but treat him always beforehand with sincerity, and afterwards, with affection and respect.

Be not sanguine before marriage, nor promise yourself felicity without alloy; for that is impossible to be attained, in this present state of things. Consider beforehand, that the person you are going to spend your days with, is a man, and not an angel; and if when you come together, you discover anything in his humor or behaviour that is not altogether so agreeable as you expect, pass it over as human frailty; smooth your brow, compose your temper, and try to amend it by cheerfulness and good nature.

Remember always, that whatever misfortunes may happen to either, they are not to be charged to the account of matrimony, but to the accidents and infirmities of human life; a burden which each has engaged to assist the other in supporting, and to which both parties are equally exposed .-Therefore, instead of murmurings, reflections, and disagreements, whereby the weight is rendered abundantly more grievous, readily put your shoulder to the yoke and make it easier for both.

Resolve every morning to be cheerful and good natured that day: and if any accident should

you out of temper with everything besides, and especially with your husband.

Dispute not with him, be the occasion what it will; but much rather deny yourself the trivial satisfaction of having your own will, or gaining the better of an argument, than risk a quarrel, or create a heart burning which it is impossible to know the end of.

Be assured, a woman's power, as well as happiness, has no other foundation but her husband's esteem and love; which consequently, it is her undoubted interest, by all means possible, to preserve and increase. Do you, therefore, study his temper, and command your own; enjoy his satisfaction with him, share and soothe his cares, and with the utmost diligence conceal his infirmities.

Read frequently, and with due attention, the Jargonelle, matrimonial service, and take care, in doing so, not to overlook the word obey.

In your prayers, be sure to add a clause for grace to make a good wife; and at the same time, resolve to do your utmost endeavors towards it.

Always wear your wedding ring, for therein lies more virtue than is usually imagined; if you are ruffled unawares, assaulted with improper thoughts, or tempted in any kind against your duty, cast your eyes upon it, and call to mind who gave it you, where it was received, and what passed at that sulemn time.

Let the tenderness of your conjugal love be expressed with such decency, delicacy, and prudence, as that it may appear plainly and thoroughly distinct from the designing fondness of a harlot.

Have you any concern for your own ease, or for your husband's esteem? Then have a due regard to his income and circumstances, in all your expenses and desires; for if necessity should follow, you run the greatest hazard of being deprived of both.

Let not many days pass together, without a serious examination how you have behaved as a wife; and if, upon reflection, you find yourself guilty of any foibles, or omissions, the best atonement is to be exactly careful of your future con-

Political Fanaticism .- Madame Roland relates a singular instance of party spirit, exhibited during the French revolution. It being the purpose to rouse the fears and spirit of the people, and direct their animosity against the court party, Grangencuve agreed that he himself should be murdered by persons chosen for that purpose, in such a manner that a suspicion of the crime should attach itself to the aristocrats. He went to the place appointed, but Chabot, who was to have shared the same fate, neither appeared himself, nor made the necessary preparations for the assasination of his friend, for which Madame Roland dilates on his poltroonry .- Scott's Life of Napoleon.

" If Brittannia rules the waves," said a qualmish writing-master, going to Margate last week in n storm, "I wish she'd rule 'em straighter."

Kett, in his Flowers of Wit, gives an outrageous specimen of pulpit panning, published in a sermon written and preached in the reign of James I .-"The dial (says the preacher) shows that we must die all; yet, notwithstanding, all houses are turned into alc houses; Paradisc is a pair of dice; our marriages are nerry ages; matrimony is a matter of money; our divines are dry vines; was it so in the divined have of the the matriages are nerry ages. The matrimony is a matter of the the matrix of the ma into alc houses ; Paradisc is a pair of dice ; our happen to break that resolution, suffer it not to put days of Noah ?-Ah no !"-Liverpool Kaleidoscope. per box.

Scions of Apple and Pcar Trees. For sale, at the New England Farmer Seed Store, No. 52 North Market street. Boston, a large collection of Apple and Pear Scions,—among which are the following:—

. Apples. Gardener's Sweeting. Roxbury Russet, Nonsuch. New York Pippin, Baldwin, Grand Sachem, Cat-head, or Large Sum- ? Gilliflower, White Shropsavine, or } mer Russet, Rhode Island Greening, Early Harvest, &c. &e. Pears.

Heathcot. St Germain, Rushmore's Bon Cretien, Spice Rousselet. Red Bergamot, Moor Fowl Egg, &c. &c.

Large Iron, or Pound. Gansel's Bergamot, Brown Buerre, Early Juneting, St Michael's. Broca's Bergamot, Bartlett.

In addition to the above, we are daily procuring fine varieties, from responsible sources, and hope to extend the collection so as to comprise all the esteemed fruits raised in the vicinity of Boston and New York.

The scions are in fine order, and the utmost dependence can be placed upon their genuineness, as they are all cut from bearing trees. eptf

Alderney Heifers, Saxony Bucks, and Calves of the Short Horn Breed.

For sale, three full blood Alderney Heifers, two years old, two expected to calve in August next, by a full blood Short Horn Bull-three full blood Saxony Bucks, one, two, and three years old-a full blood Heifer Calf, of the Short Horn Breed, four weeks old-a very fine Bull Calf, 3-4 blood, six weeks old, his dam from an excellent native caw, sired by the well-known imported bull Holderness the sire of this call, a full blood Short Horn Bull—the last calf is thought very superior. For terms and further particulars, inquire at the New England Farmer office. March 5, 1829.

Fruit Trees.

Messrs WINSHIPS respectfully request those of the public who may incline to favor them with their orders the ensuing season, for fivit and ornamental trees, fancy shrubbery, herbaceous plants, whether indigenous or ex-

otic, to forward their orders immediately, and they will be executed with every possible despatch. They also have several hundred genuine Isabella Grape Vines, by the hundred or single plant, with the superior European kinds in cultivation in this country. Letters directed to F. & I. Winship, Brighton.

P. S. Asparagus roots from one to four years old. England Farmer Seed Store, 52 North Market street, will be executed at the Nursery prices, and the trees delivered in Boston, free of expease for transportation. Brighton, March 11, 1829.

Assorted Seeds for Families. For sale at the New England Farmer Seed Store small boxes of assorted Seeds for Kitchen Gardens. Each box contains a

package of the following Seeds: Early Washington Peas
Dwarf Blue Imperial Peas

ADDITIONAL REMARKS ON THE BARK-LOUSE, OR COCCUS.

MR FESSENDEN-Agreeably to your intimation I have examined the specimens sent you by Mr Bartlett; and offer the following remarks on those

In the paper numbered 3.

These are the insects which have been the subject of some speculation and queries in your Journal, and prove, as I have conjectured, to belong to the genus Coccus, though a distinct species from the oblong one of Perley. The insect itself was new to me, but the figure was familiar, and I have, for some time, been endeavoring to ascertain where I had seen it. At last, in the Transactions of the Royal Academy of Sciences of Stockholm, for IS25, I have discovered a little memoir by the naturalist Dalman, with figures of several new species, one of which greatly resembles that which is before me. Dalman's memoir is, principally, in the Swedish language, and therefore unintelligible to me ; but the scientific part is in Latin, and from that with a reference to his figures, I propose to make some extracts, as tending to illustrate our insect, and proving it to be, at least, congeneric and closely allied, if not identical.

The Swedish insect is called Coccus cryptogamus; the specific name being derived from two Greek words which signify concealed nuptials .-Dalman observed the twigs of a kind of Aspen to be covered with numerous scales some of whith were larger than others; the former were discovered to be the habitations or pupa-cases of the females, and the latter those of the males. "The case (puparium) of the female is of an irregular ovate form, pointed at one end, and dilated at the other, or similar in shape to our oyster-shell. It the shell of the larva at its apex. is of a silky or membranous texture, of a whitish color, with an oval dark speck at the pointed extremity. This dark portion is the cast-skin of the above shows the actual length. former larva. Beneath this habitation the female resides, and from it never emerges;" she is therefore entirely concealed from her mate, a fact which the wings expanded. is equally true in other species, as has been previously intimated. "The female herself is minute. the length of the body. The feet are not discovand surmounted at one end by the oval shell of plain one by reference to the other. the larva. The metamorphosis takes place under

sisted eye, it appears only as a red atom, but it is attained, as in providing for a succession of the furnished with a pair of long whitish wings, long species, the effect is much greater than where the antennæ or horns, 6 legs with appropriate joints, injury is inflicted merely by organs furnished for and 2 filaments or bristles terminating the tail .- | self defence or temporary nourishment. This minute insect perforates the middle of the case covering the female, and thus celebrates its nuptials with its invisible partner." The rest of the history may be gathered from what is known of other species. After impregnation the female deposits her eggs beneath her body, and dies; and the young Cocci, or lice, leave the shelter, under which they were fostered, by the natural crevice at the posterior part of the shell which covers the mother.

It will be distinctly recollected that I do not assert the insect, mentioned by your correspondents of an oval form, wrinkled at the sides, flattened M., Judge Buel, Mr Bartlett, and others, to be the above, of a yellowish red color, with a pair of Coccus cryptogamus of Dalman: further observablack eyes, and a proboscis" apparently one-third tion of the American insect (which is now for the first time known to me, and that only from a few erable. "The proboscis is constantly inserted imperfect and dead specimens of the puparia) must spots, and partially russeted. Flesh melting, white into the bark, and through it the sap, which nour- determine or disprove its identity with the Swedish ishes her, is imbibed. The puparium of the male species. Those gentlemen who are familiar with is of similar color and material with that of the fe- our species, will readily perceive the close resemmale, but much smaller, very narrow, and oblong, blance, and, I hope, will excuse the attempt to ex-

FOR THE NEW ENGLAND PARMER.

SELECTIONS OF NOTICES OF THE NEW VARIETIES OF TABLE PEARS.

(Continued from page 283.)

In the year 1820 the following pears were presented to, tarted, and examined by the Council of the London Horticultural Society, and the following notices inserted in their Transactions, vol. iv.

I. Marie Louise. " This pear (says the Editor) has far exceeded the highest expectations formed of it. Its general form is like that of the St Germain, but tapering less towards the stalk. The skin is of a greenish yellow, deepening when exposed to the sun, or when full ripe to a rich vellow, clouded with light brown russet. Flesh inclining to yellow, perfectly melting, with abundance of sweet juice. It is in favorable situations sometimes five inches long, and three inches wide, weighing 8 ounces. Its period of maturity from the middle of October to the middle of November. It is a new seedling Flemish pear, said to have been raised by the Abbe Duquesne, who also raised the Napoleon.

The description is so minute, that any persons can readily know whether any pear which they may have received for that, be the same or not Persons, who may have fruit under that name, which shall differ essentially from the above, are carnestly requested to give notice of it, and of the differences, and to state from whom they received the trees or grafts. This is the only mode by which the introduction of false names can be prevented. Already great confusion has taken place in Europe as to these pears of recent production, although the eyes of scientific horticulturists have been constantly upon them. Thus for example, cle represents the natural size of the male with the Napoleon has, by some heedless person, been called L' Empereur, and it now appears in some catalogues as two different pears .- J. Lowell.

2. Charles D' Autriche pear-received from Dr Van Mons. This is a large variety, three inches and a half by three inches. Stalk an inch longeye in a confined cavity not deeply sunk. Skin greenish yellow, profusely sprinkled with brown -very juicy, with a rich high flavor, but with little or any perfume; a beautiful and fine fruit. Period of maturity about the middle of November. Mr Knight thinks it will be productive. [Remarks-By russeted is meant a roughness such as is seen in the Russeting apple and the Monsieur Jean .-By perfume, as distinguished from flavor, is meant the peculiar aroma, which is perceived in the Seckle-the Gibson, or Amory-and eminently in the Moor Fowl Egg, or Echasseric.]

3. Tillington. J. A. Knight, Esq. sent specimens of a pear raised from a seed of the antumn ehort with a disposition to fleshiness at its insertion. Skin dull green on the shady side, with a dull brick-dust red where exposed-the whole a good deal russeted. Flesh white, nearly beurre or buttery, with a little grit, [or stoniness] at the core - particularly sweet and rich, though not very juicy. It ripens in the middle of November, but remains a considerable time without spoiling.

In the London Hort. Transactions, vol. v. part i. is a notice of the Hardenpont de Printems, or Beurre Rance as the French call it.

4. Beurre Rance. This is a very superior seedling raised by Mr Hardenpont, of Mons, and called the Hardenpont de printems, (so called because it does not ripen till April-the English name would be "Spring Hardenpont.") Mr Turner of the London Hort. Society says he believes it to be the same which Mr Noisette calls in the "Jardin Fruitier" Beurre d' hyver. [If this conjecture be right we have it in this country under both names -for trees of the Beurre d' hyver have been often imported and sold in Boston, though I believe neither these, nor the Hardenpont de printems, have yet borne. I beg gentlemen who may have the Beurre d' hyver, to give notice when it bears, that we may know whether it is a synonyme of the Hardenpont. Hardenpont is the right name .- J. LOWELL.]

The Hardenpont resembles, says the London Hort, Society, the Colmar in form-but it is larger, and not so blunt at the insertion of the stalk .-The eye is large, very little sunk-stalk longskin green, never becoming yellow, nor partaking of red, sprinkled with many minute brown spots. Flesh greenish white, melting, with a little grit at the core, very juicy, sweet, and high flavored .-Specimens of this very excellent pear were received from Mr Parmentier of Enghien. The tree bears well as a standard, and the fruit keeps well till March and April. [Probably this pear will be the most valuable of all. There is a beautifully colored figure of it in the above cited work. It is exceedingly like the St Germain to my eye .-J. L.]

5. In the London Hort. Transactions, vol v. part ii. notice is taken of a pear called the Bezy Vaet pear. [We would remark here that the prefix Bezy is very common to French pears, and it may be useful to our readers to know that it signifies "wilding," or wild pear-thus the Chaumontelle is called Bezy de Chaumontelle, meaning the wilding of Chaumontelle.] "The Bezy Vaet pear is one of the numerous new Flemish varieties, the general cultivation of which will add materially to our stock of winter pears. The Bezy Vaet resembles a very large Swan's Egg pear, both in form and color, but the skin is smoother. The flesh is yellowish, perfectly melting, with abundance of rich sweet juice, and most agreeably perfumed. Mr Parmentier states that in Flanders it bears freely as a standard, and that the fruit keeps till March and April. It is a great acquisition to our gardens."

This is the language of the Council of the London Hort. Society after trying the pear. I do not know that it has reached our country .- J. L.]

6. Colmar Epineuse-or (translated) Thorny Colmar. This is another of the new Flemish pears. It is a free bearer as a standard though it does not attain a large size. It is of the Colmar to drop their lambs the first of January, and they form, though rather more pointed at the insertion | did well that month. The winter is a wrong time of the stalk. The skin is greenish yellow, much of year for lambs to come. If they are not under

sweet, and extremely rich-it keeps well till December and January, and probably still later. 7. Delices Hardenpont, another new Flemish

seedling. This name imports the " Delight of Hardenpont." It requires a wall to bring it to perfection, but to which its excellence well entitles it. [It may do well as a standard here .- J. L.] Under favorable circumstances it attains to three or four inches in length and two or three in breadth. The skin is bright yellow intermixed with green, and sprinkled with many green spots -flesh very white, melting, juicy, and sweet, but with very little perfume-ripens in November and December .- London Hort. Transactions, vol. v.

[When this selection shall have been completed I shall send you some admirable remarks from this number, on the subject of the names of fruits, to which the attention of all cultivators is invited .-Nothing can equal the licentious and heedless abuse of the names of fruits which has heretofore existed in this country, but we are beginning to reform. If it were only a matter of curious accuracy, or a mere love of order which leads us to wish a reform in our names, we might be justly ridiculed, but it is of the last importance to horticulture. I have waited ten years for the bearing of a pear tree, and at last found myself deceived, because forsooth it pleased formerly the New York cultivators to call the St Michael, the Vergalieu .--J. L.]

8. Beurre Capiomont, or Capiaumont-first raised by M. Capiaumont of Mons. It is as large as a St Germain, pyramidal tapering very much towards the stalk, which is long and slender-skin smooth, light cinnamon color with a rich gold color showing through it-in some specimens the skin is darker and rougher-the flesh is white, perfectly melting, with a rich sugared juice. We tion in the foregoing, which you deem worth pubhave not observed that it has any perfume, but it vishing, it is at your service. is a high flavored and valuable fruit. It has not kept with us beyond the end of November.

[The Capiaumont has repeatedly borne with me. It fully answers the above description, but in the two last hot summers it has not kept beyond the 1st of October. I will say here once for all, that I apprehend that both the winter and autumnal pears will ripen with us from 6 to 8 weeks earlier, than the same varieties do in England, Flanders, or even in Paris .- J. L.1

To be continued.

REARING LAMBS. Mr. Fessenden-I would, with pleasure, give your correspondent, Mr. Barstow, of Maine, mentioned in your paper of the 13th just. [page 267 of the current volume of the New England Farmer,] any information in my power, respecting sheep; but, as I have had but few years experience, and get my information from books, and verbal inquiry, I would have my suggestions taken with caution. I do not think that there has any injury come to his sheep from the hav of last year's growth, nor that it is the cause of the lambs' dying, which were dropped in February, which has been the worst month in the late winter for lambs. But I should presume, from his own account, that he has been, and is now, injuring them by nursing. Yet I sympathise with him, for I too have a hundred ewes, which, contrary to my intention, began

cover, the lambs will be crowded in cold nights. and smothered by the old ones.

I think that sheep which do not begin to drop their lambs until the last of March, may be kept through the winter in health and good order, upon such hay as he describes, with, or without vegetables; a little corn may be given at yeaning, just to cause the milk to spring; but I have always heard it considered as heating and inflammatory, so much as to cause the common sheep to shed their wool, when given freely. A few oats are good, given occasionally, from the middle of April to the middle of May, to correct the scouring which the young grass occasions; the effects of which may be seen in their dirty breeches.

Instead of tar, turpentine, rosin, or spirits of turpentine, in mid winter, and towards spring, when they are looking for some green thing, and finding none, I give my sheep elder boughs, which they feed on with sufficient avidity for medicinal purposes, and thus, I think, very much promote their health and appetite. If any of the above things are absolutely necessary, though I do not know for what particular complaint they are in any case recommended, I should prefer the rosin in powder, as that may correct the cough, which often prevails among the old and poor sheep; and I know it to be a remedy for the heaves, by giving to a horse a table spoonful, with the same quantity of nitre, finely powdered, and given once a day in his mess. I have several times stopped the disease, when coming on, in three successive

But I should be cautious how I used boiled milk for young lambs, as recommended in an editorial note : as it is considered, in our neighborhood, as certain death to a calf within 24, and generally in 12 hours.* If there is any informa-

Yours respectfully, Bridgeport, March 17, 1829.

* Note by the Editor .- Boiled milk, however, is more easily digested in the human stomach, than raw milk, and reasoning from analogy, one would suppose that the same thing would take place with respect to brute animals. We have, moreover, the authority of Deane's N. E. Farmer, in favor of the opinion suggested. In that work it is asserted, [page 55, Wells & Lilly's Ed.],

" If skimmed milk is given to calves, it should be boiled, and suffered to stand till it cools to the temperature of that just given by the cow. It is better boiled than warmed only."

FOR THE NEW ENGLAND FARMER.

I take the liberty to send to you, for the inspection and gratification of the curious, two large glass bottles, and five smaller ones, containing as fol-

No. I. A large piece of honey comb, with about fifty dead bees on it, in the centre of which is the Queen Bee*-all in a good state of preservation.

* Mr Rufus Howe has for sale swarms of Bees, also Honey in white comb-and will have for sale the blossom Honey, in covered with russet—flesh yellowish, melting, cover, they will die of exposure; and when under while comb, twenty days after the apple tree buds appear.

The swarm, from which this collection of bees the plum curculio) and stinging and poisoning preservation.

summer, and again drying.

No. 3 Contains three Drones, or male bees, three working bees, and a full sized apple tree borer, all in a good state of preservation. The borer was taken the moment of eating through the bark of the apple tree, after three years annoyance to it.

No. 4 Contains a number of Queen bee cells, detached from the old comb, not in a good state of preservation, as they also moulded last sum-

No. 5 Contains a number of the Bee Millers, not in a very good state of preservation, moulding in the summer likewise.

No. 6 Contains some earth with a number of excrescences or warts of the plum tree. In these warts are the maggots which produce the bug called "Curculio" that destroys the plum fruit, and has made its appearance, the glass having been put in a sunny place; and after remaining a day in sight, has secreted itself in the dirt, there to turn to a chrysalis state. The grub resembled fined to ourselves. somewhat the female or wingless canker worm grub, but in size, less. I presume more are in the warts, and in a few days, the bug curculio will be produced from the chrysalis.+

No. 7 Contains five moth worms, such as destroy the comb in the hive. I have taken out two there perished.

I intended to have sent some pear tree borers, (if I may so call them) but they have eaten through a good cork that confined them in a bottle, and consequently made their escape. Last September I took from two pear trees, the above borers, from under the bark of the body of the tree; the trees had been very thrifty and healthy, but were then reduced to one branch each, the others havspots, in size, from half a cent to a dollar; by and they are easily found. I should think I destroved fifty, besides eight or ten I preserved in a bottle. They are a little longer than a barley corn, but not quite so large round; full of little for the year; and we still believe that the produce, bristles, which extend from the body, and a black in proportion to the lahor employed and the facilhead. When I extracted these from the tree, I observed three or four on the outside, lowering themselves down by their web, and presume they were going into the ground, (for I can now find those, who have had more favorable opportunities none in the trees,) there to change to a chrysalis state, and next summer appear in a bug shape (as

was taken, starved to death; came late in the again the branches with their eggs. When the season, and the unfavorableness of the weather, branches are stung the bark turns red, cuts and which was unusually wet, did not enable them to looks something like liver - a red water runs from its benefits will be felt for some time to come. On make a sufficient supply of food, for their own it. The sooner it is cut off and burnt the better, the other hand, the tenant is to be credited not as we are then sure none will escape. When the No. 2 Contains a Queen bee, a Working bee, body of the tree is diseased, the sooner also, that and a Drone, or Male bee, not in a good state of is dug up, and served in the same manner the betpreservation, on account of their moulding last ter. It appears to me the only way to destroy this insect, is to destroy their eggs in the tree .-My reluctance to dig up my trees, before they were so much affected, has proved much to my disadvantage.t

> If the above observations, will assist to put a stop to these great depredators of our pear trees,it will be a great satisfaction to the writer of this ar-

Dorehester, March 30, 1829.

FOR THE NEW ENGLAND FARMER.

Mr Editor-We have no inclination to engage in a newspaper controversy; but in our own defence we beg to make one or two remarks on the communication of Mr J. W. P. in your last Farmer. The remarks on the Report of the E.Ag.Soc'y, were written neither at the suggestion, nor with the branches; one of the grabs in this collection the privity of the tenant of the Indian Ilill Farm; nor with any intentional disrespect to the Committee; but from a sense of wrong, which Mr P.'s defence has not lessened. Nor is this feeling con-

We know but little of the proceedings at the Essex Cattle Show. We are ready to believe that the Committee designed on that occasion to act with judgment and impartiality; and it is difficult in such a thankless office to avoid complaint, or ever to satisfy a disappointed competitor. In the quarts of such this season from one hive. What decision, upon farms, Mr G. having entered his few bees were left, were drove in the corner and farm for premium was justly liable to censure in not complying with the conditions prescribed and furnishing an exact account of the labor and produce. The Committee were bound to notice the farm and state the facts in the case, which had come to their knowledge, whether they made for or against the competitor. But beyond this we hold they had no right to suggest anything against this individual's private character, by insinuating that such a fondness for dogs and horses on his ing been sawed off on account of their being stung part as must lead to a foolish and wasteful expenand dying. These borers are found in round diture; an inference in respect to him, though it might be unintentional on the part of the Commitwhite washing the tree, the stain comes through, tee, which would be likely to be made on every one, who read the report.

In common with the Committee we should be happy to see the result with respect to this farm ities offered, has not been surpassed by any farm in the county. In this, however, we may be mistaken; and we rely much on the judgment of of observation than we pretend to. But then in: comparing the expense with the produce, certainly it would not be fair to charge to the current year all that has been expended for stock, utensils, These make a part of the capital stock of a farm. On the side of expense is to be placed, not the cost of these articles, but the interest of their cost, with a proper

‡ Pear trees which are very thrifty and have smooth branches, are the choice of the bug. The first tree that was attacked in my garden, was near a mauure heap. I have not seen a pasture, or slow growing pear tree attacked yet.

allowance for loss, or injury, or deterioration. Nor is the full cost of the manure purchased to be placed to the expense of the present year, since merely with the amount of produce raised, but likewise with the permanent improvements, such as walls built, hedges formed, trees planted, threshing mill erected, &c. &c. together with some allowance for the better condition of the estate.-We should be glad to see this account fairly stated. and we believe that the result would be creditable to the tenant. This, bowever, is matter of judgment merely, in which we have no disposition to set up our own opinion in opposition to the judgment of the Committee.

We cannot but hope that the exact statements of the different claimants for preminms, as to produce and management of their farms, will be forthcoming. The public will be benefited by such statements; the more particular the better.

Our remarks on the general character of reports, and the attempts at wit in them, had no reference to this case, but to the reports of a neighboring county, on swine, &c., which were indeed very amusing, but we think out of place. We assure you, Mr Editor, that in regard to the Essex report, we are indeed not guilty even of suspecting that there was any wit in it. Like other wise men, upon review, we firmly adhere to our opinions, and beg leave with all due "mildness and courtesy" to subscribe ourselves,

Respectfully yours, ESSEX.

SITUATIONS FOR BOYS.

MR EDITOR-It frequently happens, in my intercourse with the poor, as a minister at large in this city, that parents apply to me for places for their children, and especially for their boys, for whom they are not able to provide food and clothing at home. And as I should be particularly glad to send these children into the country, I will beg the favor of you, either by publishing this note in your paper, or in any other way which you may think to be better, to give notice that, if a farmer or a mechanic in the country, is disposed to take a boy from the city, to be brought up either in his shop, or on a farm, I shall be ready to give him any assistance which is in my power in obtaining one, who may at once meet his own wishes; and by taking whom into his family, he may perform an important act of christian charity. Respectfully,

JOSEPH TUCKERMAN.

CASTOR OIL.

Dr D. A. Reese, of Monticello, Geo. made about 600 bottles of Castor Oil last year, notwithstanding the dry season. The best Castor Oil now used is made in this country. Several years since this medicine was a very nauscous one; it not unfrequently caused the throats of patients to smart, by reason of its rancidity. It is now sold destitute of every unpleasant smell, and as transparent as water. Old associations still cause many persons to shudder at its name: yet we hear of some who regard the flavor of it as similar to that of walnuts, and one in particular declares that he could relish it on bread .- Bost. Pat.

Apples grown on dwarf trees, are brought to the fruit market of Paris in December.

[†] The warts should be destroyed before this time, in June and July would be best. Be careful to go far enough below the excrescences, not to leave a black spot in the sap wood. It would be still better to jar the tree a little, and thea the punctured plums would fail; then take the fallen ones and burnet. If you have near neighbors recommend the same to them. The maggot leaves the fallen plums in less than twenty-forwhouse and ones into the ground, and there changes to the forwhouse and ones into the ground, and there changes to the theun. The magger leaves the rained plums in less man (wenty-four hours, and goes into the ground, and there changes to the chrysalls state. Some varieties of plum trees the curculio avoids; I presume the gum does not suit them; fruit is their first choice, as plums, apricots, &c. By following these rules you can keep them under, if not externinate them.

LARGE PEAR.

MR FESSENDEN-I observed in your paper, No. 34, page 267, an article signed A Susscriber, stating that the author did not know if the pear, mentioned in a New York journal, also in yours of the 9th of January last, was an eating or a baking pear. Not being much acquainted with the English language, I thought that when I said it was of an excellent quality, as well for its size as for its flavor, which were the words of a member of the Committee of the Royal Horticultural Society of Paris, who sent me six trees of this kind, that I should be understood that it was for eating; as it is not the custom in France to use the word flavor, when speaking of the baking pear.

I did not wish to profit by the error made in the circumference, the height, and the weight of the pear, by saying that I have received the kind of pear, mentioned in your paper of the 9th of January; but not being fond of puffing, I thought proper to correct this error and give the real dimensions of this large pear.

With much esteem,

Respectfully yours, ANDRE PARMENTIER.

DISEASED BEET ROOTS.

MR EDITOR-Last April I planted Mangel Wurtzel, and some blood beets, about the middle of April. They came up well and appeared promising until the middle of June, when the under leaves began to wither. As I supposed some insect preyed upon the small roots, I put lime on a part and harrowed it in, but it answered no purpose; as those without the lime grew as well as those which had it. I planted some about the 12th of May, that shared the same fate. There were a few leaves on the top that kept alive : but I had not more than oue third the quantity that I raised on the same ground the year before; and what I raised began to rot in January. If some of your correspondents will point out the disease, and a remedy, it will confer a favor on

CANINE MADNESS.

MR FESSENDEN-If you think this paper will be useful to the public, you may insert it in your ning he returned, apparently without disease, exvaluable repository of information.

The writer has never seen a case of hydrophobia in the human species-a disease the most frightful of all maladies; almost invariably ending in distressing death. The few cases of canine madness in domestic animals, which have come and he received it as usual. I then offered him double to what it was in health. Although natuunder his observation, warrant the following re-

The disease originates in the canine family, and is communicated to other animals by inoculation. The mad animal has a strong disposition to bite, and the poisonous slaver, being brought into con- him closely. On the 25th in the forenoon, I found looks of desperation and vengeance. In this situtact with the wound, is absorbed, and produces, his eyelids swollen, and his eyes inflamed-drank sooner or later, the disease, which, like other diseases, is progressive.

is sufficient time, and the symptoms are sufficiently marked, to ascertain the nature of the disease, and confine the animal; but, unfortunately, this stage is generally overlooked, perhaps for the want of information.

The symptoms in the first stage, are, sluggishness, thirst, swelling about the eyes, especially the eyelids, the eyes inflamed, a refusal of food, an apparent soreness in the jaws, dulness in executing the commands of his master, a disposition to be alone, a propensity to ramble, frequently starting up from his slumbers and changing his place, without any apparent cause. These symptoms continue for a longer or shorter time, and the second stage commences, in which, the dog is of all animals the most dangerous. He now leaves his home for the last time, becomes fierce beyond description, his eyes have a greenish hue, he fearlessly seizes every animal in his way, slavers much, and sometimes with heavy breathing, hastens from place to place, snapping at, or biting and poisoning every creature in his power; and so continues to do, (unless he should be killed) until his strength be exhausted; and then secks some obscure place and dies. The duration of this stage is, probably, different in different subjects.

Every owner of a dog should have a knowledge of the symptoms of the disease; and carefully watch his dog; and in case, that any of the symptoms of the first stage should appear, he ought, immediately, either to kill, or confine the animal.

The following case of Natural Canine Madness will corroborate many of the foregoing positions.

In the year 1813, I lost a valuable dog by the disease. He was of a smallish size; and whatever is desirable in a dog as to usefulness, was to be found in him-a faithful sentinel, both by night and day, possessing a large share of good nature and pleasautry: hence, he was a favorite with the family, to which he was strongly attached, especially to his master. He had performed upon him, in his youth, a well known operation, which effectually prevented a disposition for rambling; and of course, he rarely went from home, except with his master. Such was his attachment to his master, and to his master's property, that an article left in the field, or elsewhere, and committed to his charge, he was wont to guard; and any person, out of my family, would meet with some difficulty in taking it from him. These remarks seem necessary, as they have some relation to the facts in the case.

On September the 24th, iu the afternoon, I wanted my dog, but he was not to be found,-this circumstance being singular, immediately led to suspicions of the disease. However, before evecept dulness. I was led to believe, (erroneously however,) from the assurance of others, that, a "dog laboring under the disease would refuse water, and that as long as he would drink, there was no danger." I immediately offered him drink, food, which he refused. On my urging him to eat, he would take a small piece and then drop it. His jaws appeared to be sore. From his taking water so freely and without apparent difficulty, I concluded not yet to confine him; but to watch water freely, but refused food. He was in a sluggish state, slept the greatest part of the forenoon There are two stages. In the first stage, there in the door yard, now and then starting up and slumbered during the last stage, or that he received

looking about, as though be had heard something at a distance, but seeing nothing, would lie down again, frequently shifting his place. But notwithstanding our vigilance, he, in the afternoon, eloped, and I could not hear of him. At that time my suspicions gained strength; and I prepared a stable, 10 by 6 feet, for his reception, placing therein a plenty of food and water. He did not return, as in the day before, nor have I any reason to think that he returned in the night following .-The 26th being Sunday, on going to church with my family, I requested my young man to keep diligent watch for the return of the dog, and that if he should come home to confine him. We had not proceeded one-fourth of a mile, before we met the dog. He was much pleased to see us, and it was with some difficulty that we kept him from soiling our clothes. He was very wet, having travelled through wet grass, or waded in the water. The appearance of his eyes and eyelids were the same. After two or three minutes he left me, and made his course directly for home .--Presuming that my young man would secure him. I attended at church. But, to my surprise, on my return, I found that the dog had not been home. Inquiry was made, but it was fruitless. Just at evening, I had occasion to walk about a mile to a friend's house. Having proceeded about half the distance, I again saw my dog coming towards me, in a very slow trot. I did not appear to notice him-he passed me, without his usual expressions of attention, went a small distance, then took my path and followed me, making some of his usual signs of gladness. It being near a wood, and as he had been fond of game, I repeatedly tried to send him into the forest, as usual, but he would not obey my commands, or he would just enter the brush and return. I then flattered him, but he did not regard it as he was accustomed. He followed me to the house, and, not wishing that he should go in with me, I laid down my hat, and gave him the charge of it, as usual, when I wished him to guard anything. I immediately finished my errand and returned to the door, expecting to find my dog waiting as he was accustomed to do. I found my hat; but, the dog was gone. I hastened home; but the dog was not to be found. Night came on and prevented further search .--However, on the 27th, about 8 o' clock, A. M. he returned for the last time. The symptoms were the same, perhaps increased. He received water, but refused food. I think, at that time, his attachment to the family had become nearly extinct; yet, with a little flattering, he was induced to go into the place prepared for him. He soon became very uneasy and peevish; and in the afternoon all the symptoms of the second stage appeared. His eyes put on a greenish appearance, and his countenance was inexpressibly ferocious. To him, his master and a stranger were alike. He was in a rage, all the time, when any person was near; snapping, biting, and tearing to pieces, whatever came within his reach. His strength seemed rally clumsy, he was then all spring and activity. There were spaces between the boards, through which he could see, and it was astonishing, how steadfastly he would fix his eyes on a person, standing near, and watch him for a long time, with ation he continued till the evening of the 29th, during which he occasionally took water with greediness. I have no cause to believe that he

Vol. VII .- No. 37.

any food after the commencement of the disease. In the morning of the 30th he was much exhaust- itous lands are very often made in the direction of no answers have appeared, this same young ed, not able to walk, and his breathing, laborious. the descent, instead of making them transversely I then took some water in a vessel, and fearlessly entered the stable, on which he made some feeble signs of gladness. He was in a sitting posture, supporting himself on his fore legs. I stood be- heavy rains. Corn and potatoes, ought, therefore him and poured the water in a small stream, fore, to be planted and kept in transversal lines, holding up the vessel; and instantly he was seized following the same principle. with excrutiating convulsions, which in a very few minutes, ended his life.

On a slight examination of the body, the highest marks of inflammation were discovered upon lands, which are to be planted in the spring throughout the system.

I have been thus particular, presuming that the case would afford useful hints to those, who are fond of, and keep these animals. Although the dog may be useful to many; being the only animal, known to us, which will leave his own species and associate with man; and in some instances a useful protector, both of property and life; yet, every dog is liable to this disease, terrific beyond expression in its effects: therefore, all possible care should be taken in season to prevent the disease from spreading, which will not be done, unless the owner have some knowledge of the symptoms, which mark it.

This is not considered a medical paper; yet, it may be useful to state, that should any creature be bitten by any animal laboring under the canine disease-the first step to be pursued, is, thoroughly to wash the wound and parts adjacent, with warm water, and wipe them clean, with a view to remove all the poison that may adhere upon, or about the wound-then cut out, or destroy the part to the bottom of the wound with some strong caustie, and dress it with mercurial ointment .-This practice should not be neglected, should the wound be made two or three days before it is discovered; as it is thought that the virus is not readily absorbed; but, the sooner it is done, the better.

Mansfield, Feb. 26, 1829.

OBSERVATIONS ON SOME SUBJECTS OF CULTIVATION IN LONG ISLAND.

DEEP PLOUGHING.

MR FESSENDEN-Having observed that in difonly; and to begin by ploughing one inch deeper years, until the influence of the atmosphere, manuring, and other subsequent ploughings should which is a very cheap manure. have mixed the soils together. This gentleman told me since, that he had succeeded beyond his expectations. His corn was visibly larger and Horticultural and Botanic Garden, stronger than that of the other side, which was ploughed in the ancient manner. I do not doubt but that his example will have much influence; so that the ploughings will be bye and bye from 8 to 10 inches deep; and be done by gradually deepening one inch each year. The ground thus gradually ploughed would preserve some moisture, very beneficial in dry summers; the soll having been able to concentrate a much greater degree of humidity; and in wet seasons, the ground being more porous, the water would not remain on the surface and rot the roots of the crops.

I have taken notice that the furrows of decliv- cultivation, were inserted in your paper. As or crossways, in such a manner as to preserve as much of the soil and manure as possible on the top, and prevent them from coming down by

MANURE.

The manures which are brought beforehand are, most generally, spread out on the ground without being heaped together. The more manure is spread the more the atmosphere and rains take from it its nutritive parts. Manure may be heaped together in the form of a cone, which should be covered with ground; or if the ground is frozen too hard, the heaps could be covered with mats, very easily made by tying straw between small poles, six or eight feet long, which being put away afterwards, in a dry place will be good for another year. In this manner none of the fertilizing salts can escape. But speaking of this interesting matter, I must say that I am astonished that no composts are made, which are the means of trebling the mass of manures, without occasioning any other expense than that of mixing earth with the manure by layers one above another, and by adding all kinds of vegetables. the dung to dry and be spoiled by the scratching of fowls in the yard, it should be successively carried when it comes out of the stables on the fields. where it is to be used for the fall or spring. For this purpose a small corner might be left, where country. it could be deposited. It would be convenient, if possible to make a few heaps of earth, and have them ready for mixing with the manures.* It will and even writing paper, as ever was made from be objected that this would be an increase of la- any rags in the world, and much better than can bor, but it will be repaid an hundred fold.

PLOUGHING IN GREEN CROPS.

Next year I shall be able to give the result of some experiments made by Jonathan Thomson, Esq. Collector of the New York Custom House, who, on his large farm at Islip, L. I. at my request, had the goodness last year to have sown and ploughed in, three successive crops of buck- what a difference in paper made from this materiferent places the ploughings were not of a suf- wheat in blossom. He has great hopes of success al, and the rugged stuff made from hemp, or old ficient depth, I spoke about it to a gentleman, in this experiment, the soil being entirely changed, ropes! What a difference between paper made owner of large estates, at Bedford, Long Island; and seeming to contain a quantity of rich mould, from corn stalks, and white brown stuff, which and asked him to try the experiment on one acre and all that which is necessary for having a fine crop this year. I hope that the example will be than before; for if it was ploughed very deep at followed in places at some distance from large The "TREATISE ON COBBETT'S CORN," is, as you once the ground would become sterile for some towns. This sowing three times repeated, only are aware, published and sold, bound in boards; took nine bushels of buck wheat seed per acre, and all that have been sold of late, have had boards

QUERIES RESPECTING FOOD FOR STOCK.

Mr Fessenden-A few weeks since, several queries from a young shepherd, in regard to root

* Layers of new dung one foot thick, and those of earth from 3 to 4 inches. If made of old manure dung one foot thick and to 10 to 4 inches. If made of old manure dung one foot thick and so arth 6 or 7 inches. The heaps should be made in circular or square forms, and some earth put around them to preven the access of the atmosphere to the layers of manure.

shepherd is led to believe either that the cultivation is found unprofitable, or that no one has practised it so far as to be able to furnish answers; or that the queries were not sufficiently definite, or not worthy the notice of the owners of flocks of sheep. On the supposition that one of the two last may be the cause of the silence, I beg leave to substitute the following.

let. What quantity is a fair average product to the acre of mangel wurtzel, ruta baga, carrots, and potatoes, and what the expense of cultivating an acre of eithor of the above roots?

2. How many bushels of either of the above roots are equal to a ton of good hay for feeding stock of any kind?

3. Are either of the above cheaper for feeding stock in part than hay, valuing it at \$6 per ton?

NEW ENGLAND FARMER.

BOSTON, FRIDAY, APRIL 3, 1829.

COBBETT'S CORN.

A friend has obliged us with a copy of Cobbett's Weekly Political Register, of Jan. 10th, 1829 .-This, according to Mr Cobbett's statement, was printed on paper made from the husks of Indian corn, raised by him in England. It has been heretofore supposed that the temperature of the climleaves of grass, sods, &c.; and instead of leaving ate of Great Britain would not admit of the cultivation of this plant; but it seems that Mr Cobbett's success in its cultivation has been complete; and that he has found it well adapted to uses to which it has rarely if at all been applied in this

Mr Cobbett says " I am certain that the husks of this corn will make as beautiful printing paper, possibly be made from any other thing than very fine linen rags. Of the brown paper, or rather olive colored paper made from the stalks of the corn, a specimeu of that you have, as a wrapper to the bunch of corn which I have now the honor to send to you. Compare it, sir, with anything of the kind you have ever seen before. You will find it as easy to write on as any white paper is; grocers and others make use of, and which is so easy to tear, while it cannot be written on at all. with this olive corn paper for a covering, and very handsome you will find it to be; and I send you a second book, in order that you may have this further proof before your eyes, of the estimable value of the corn plant."

The writer then asserts that Mr Rowland Hill. of Chillworth, first suggested the thought of making paper out of the husks of corn; and that it was owing to his enterprise that the specimens were produced; and continues, "Reflect, sir, on the vast importance of producing on our own land the materials for such an immeose branch of manufacture! In a very few years all the paper used

corn plant. All the stained paper, where toughness is so necessary and rarely now to be found; indeed paper of all sorts, for nothing can be so cheap and nothing can be better.

Indian corn is not altogether a novelty. Dr Willich's Domestie Encyclopedia states that "from fects. the leafy stalk of this fruit, according to Planeus, Italian mill, near Rimini. Schaeffer made an experiment with the whole plant, and obtained a greyish paper; but, after steeping the pulp four days in lime water, the sheets acquired a greenish

" Dr Mease saw a book, printed at Regensburg, in Germany, in 1771, upon paper from a variety of substances, and among others, there was one leaf made from the Indian corn, or maize busks."

SUBSTANCES WHICH MAY BE MANU-FACTURED INTO PAPER.

The following are some of the different substances belonging to the vegetable kingdom, which have been employed in the manufacture of paper.

The pith of the various species of Thistle have been employed in Germany. The stalks were stripped of their cuticle, bruised, and the inner spongy substance extracted and worked in the mill. Hemp. Dr Halde asserts that the inhabitants of Nangha, in Japan, macerate hemp in lime water. beat it, and then immediately prepare their paper. Guettard asserts that the shaws, and other refuse from the stalks of hemp, may be made into a good and strong packing paper. Hop vines .- Dr Schaeffer plunged them for fifteen minutes in boiling water, then separated the rind from the woody substance, cut the latter into small pieces and sent it to the engine. After being worked eight hours they became fibrous, pulpy, and were fit to be formed into paper: on adding rags the sheets assumed a whitish appearance; but without them had a brownish shade, and were uniformly of a firm consistence. The dry down of the Catstail; wooly catkins of the White Poplar; the Straws of Flax; the stalks of the Sunflower; the straw of it in abundance. If any of your correspondents Barley, and other kinds of grain have been used in Europe for making paper. The National Gazette likewise informs that "we have three specimens of yellow paper made, respectively of oat straw, blue grass, and rye straw. Its texture is firm, and on the whole it appears to be superior to the common wrapping paper."

FOR THE NEW ENGLAND FARMER.

DISEASED SHEEP.

MR FESSENDEN-In your paper of last week, I noticed Mr Barstow's account of his diseased sheep, and hasten to suggest to him, what I think the cause of the misfortune. From the brief statement he has made of the case, I have no doubt in my mind, that the feverish habit in his sheep, has heen created by the bad quality of his hay, or rather to the "plenty of salt strewed upon the hay when put into the barn." Sheep, sooner than other domestic animals, will become sickly, when fed entirely upon hay, too much impregnated with salt. They delight, and thrive well, when permitted to go often to the salt trough, but when any considerable quantity is added to their constant food, they become emaciated, and have all the symptoms which he describes his flock to la-

the barn is a great mistake, a great deviation from nature, and never attended with any salutary advantage. When the quantity is small, not more than a quart or two upon a ton, it may not be in-The manufacture of paper from the husks of jurious; but when larger quantities are used, it never fails, more or less to show its poisonous ef-

In the same way sea salt is said to be an excelthe most beautiful post paper is prepared in an lent manure for vegetables, when administered in small doses, but is absolute destruction to the largest trees, or plants of every kind, when used too plentifully.

If then, I am not mistaken as to the cause of this disease, Mr Barstow will relieve his sheep, by immediately feeding them with fresh hay, turnips, potatoes, and as much green browse as possible. The tops of the Lombardy poplar I think preferable to any other. By this treatment he may probably preserve the residue of his flock, until fresh grass can complete the cure-for he may rest assured that nitre, spirits of turpentine, or unleached ashes, will produce no good effect-and until they can be supplied with healthy food, his sheep will want their usual health; and if many of them do not lose their wool before shearing, he may think himself very fortunate.

Mr Editor, I think it no small part of the advantage which attends your useful paper, that through its medium, we can with so much facility, ask and receive advice-and I would make use of this opportunity to state a little misfortune of mine.

GIRKIN CUCUMBERS.

For several years past I have attempted to grow the Girkin cucumber, with very little success. have bought the seed from the best Seedsman in New York. It was heavy and looked well, yet not one in twenty germinated. Last year I planted seed of my own raising; it was saved, I thought, in the best manner, and planted after the Solstice, with the utmost care, yet I had not a single plant.

I deem this fruit superior to any other for pickling, and should be glad to know how to produce will be so kind as to inform how to do so, shall think it a great favor conferred upon yours, &c. S. REYNOLDS.

Minaville, March 20th 1829.

Remarks by the Editor .- It will be observed that Mr Barstow states that his sheep had been "fed on clover, herdsgrass, and red top, with a suitable quantity of oats and corn to keep them in good condition; with plenty of salt strewed on the hay when put in the barn." It is not improbable that salt in excess may injure sheep, and cattle, as well as mankind, for whom too much salt provision is accounted unwholesome, especially in winter .-Dr T. Cooper, in an article, written for the last Philadelphia edition of Willich's Domestic Encyclopedia, states, that "a quarter of an ounce of salt per day to sheep, and one ounce per day to cows and oxen, is an allowance ample enough."

With regard to the Girkin Cucumber, we would observe that it should either be started in a bot bed, or planted in a warm situation, the last of June, or beginning of July. It is a native of a warm climate, and should be dealt with accord-

RUSSELL, No. 52 North Market Street, Boston, and at the Nursery in Newton.

Bees.

March 27

Just published by MARSH & CAPEN, 362, Washing ton Street.

A PRACTICAL TREATISE ON THE MANAGEMENT OF BEES; and the establishment of a Piarie, with the bes method of destroying and preventing the depredations of the BEE MOTH. By JAMES THATCHER, M. D., Fellow of the American Academy of Arts and Sciences, &c.

Extract from the Author's Advertisement.

"The destructive ravages of the BEE Moth have in many places almost annihilated our Bee establishments, and discouraged all attempts to renewed trials. Not less than one hundred hives have, the past season, been en-tirely destroyed by that enemy, within a few towns in the county of Plymouth, and in places where a single hive has yielded one hundred pounds of honey. From a particular investigation of this subject, the compiler is now able, with much confidence, to announce, that an effectual preventive of such depredations will be found recorded in this production." Price 75 cents. March 27

Red and White Clover Seed.

For sale at the New England Farmer Seed Store, No. 52 North Market Street, 5000 lbs. Red Clover Seed.

500 lbs. Dutch White Honeysuckle Clover, (imported.) Also, Herd's Grass, Red Top, Orchard Grass, Lucerne, oul Meadow, Hemp and Flax Seed, &c, &c. March 27

The Seeds vended at this establishment, are put up on a her the Secus vended at this constrainment, are put up on a new plan this year, each package being accompanied with short directions on its management, and packed in the neatest style.—Traders are requested to call and examine for themepif

For Sale,

In the southeasterly part of old Marlborough, a valuable Farm, containing about 120 acres, consisting of every kind of land that is desirable to the enterprising farmer, a large portion of which is of the first quality, having a constant stream of water running through it; and the land is so situated that a number of acres are capable of irrigation. On the premises is an unpight two store House, with four rooms on the floor, in good repair; a large Barn, 80 by 30, and in common seasons is filled with a large narm, 50 by 30, and in common seasons is filled with good hay. There are also so in the farm, good Orchards, a part of which are in their prime; together with an abundance of Wood, the best of white oak, fit for wheelwrights use, or for slip timber. There are few farms capable of more improve-ment, or which can be carried on at less expense. The place will be sold at a fair price, with or without the steck and utenisls, at the election of the prehaser. The payments made early and accommodating, and possession may be had on delivery at the deed. For further particulars, please inquire of WILLIAM DRAFER, Esq. of Mathorough, of BENDAMIN WELD of the barry, or OSAMELE H. WELD, on the premises,

MISCELLANIES.

The Tempests of New England .- In 1717 ocourred a tempest which has been distinguished in history and tradition, as the great snow, by way of eminence. The winter has been mild and open labors, and in the diffusion of the gospel among until the commencement of February. On the 18th of that month a violent storm commenced, and continued, with short intervals, nearly a week. The north-east wind in fierce gusts drove the descending snow into piles, obliterating the traces of roads, and covering the fences, and in some places, even the buildings. The Boston News Letter of February 25, 1717, has the following paragraphs :- " Besides several snows we had a great one on Monday the 18th current, and on Wednesday the 20th, it began to snow about noon, and continued snowing till Friday the 22d, so that the snow lies in some parts of the streets about six feet high."-" Saturday last was a clear sunshine, not a cloud to be seen till towards evening, and the Lord's day, the 24th, a deep snow. The extremity of the weather has hindered all the three posts coming in; neither can they be expected till the roads, now impassable with a mighty snow upon the ground, are beaten." A letter from John Winthrop, in New London, to Dr Cotton Mather, contains a few particulars relating to "the prodigious storms of snow in the doleful winter past." The sea was disturbed with unusual commotion, and shells were thrown far upon the sands. Porpoises and other tenants of the deep throughd to the land, and in the quaint language of the writer, " the harbor and river seemed to be full of them, but none of them came on shore, but kept a play day among the disturbed waves." The snow flakes came in starlike spangles, having six little rays. Multitudes of animals perished in the drifts. "We lost," says he, "at the island and farms, above eleven hundred sheep, besides some cattle and horses, interred in the snow. And it was very strange, that twenty-eight days after the storm. the tenants at Fisher's island pulled out the ruins of one hundred sheep, out of one snow bank in a valley, where the snow had drifted over them sixteen feet, found two of them alive in the drift, which had lain on them all that time, and kept themselves alive by eating the wool off the others, that lay dead by them. As soon as they were taken out of the drift, they shed their own fleeces, and are now alive and fat." The wild animals of the forest were forced from the upland parts of the country to resort to the sea side for subsistence, and came forth from their dens by night to

make ravages among the survivors of the flocks. At the period of the visitation of this memorable storm, there were few idle writers to note down every occurrence, and no Editors in distress for paragraphs to fasten upon every circumstance, and transmit records to posterity. Except the brief notices from the only Gazette of the day, no printed accounts have been preserved. . The traditions of the past generations dimmed by the lapse of a century, as they are transmitted by those aged persons who heard the descriptions given by their accestors, represent its violence as exceeding all modern parallels. Separate facts have been preserved in interleaved almanacs, diaries, and private correspondence, which confirm their relation.

The funeral of Mr Brattle, minister of Cambridge, was solemnized on the 20th of February, and the principal magistrates, elders, and ministers ter.

of Boston and its vicinity, assembled to honor his memory, were detained several days before their return was possible. (His. Coll. vii. 58.)

Mr Treat, of Eastham, a clergyman who had passed nearly half a century in active ministerial the Indians, died soon after the storm. The snow was piled to such height that it was impossible to beat a path over it. The funeral was delayed until a passage was dug through; and after some days the remains of the holy man were borne to their resting place, through the vaulted arch, by the natives reclaimed from the forest by his pious

Judge Sewall entered in his diary, quoted in Holmes' Annals: "February 22 .- It was terribly surprising to me to see the extraordinary banks of snow on the side of the way over against us."

Several snows fell after this date. The immense body which had accumulated, during February and March, on its dissolution swelled the streams with great floods. The rivers then rolled through an uncultivated wilderness, where the busy hand of improvement had not yet spread the structures of art to be washed by their injury. Nat. Egis.

How to be a Lady's Man .- When you call on a family, should there be any children in the room, be sure you get one of them on your knee-two little ones would be better if procurable, because you might say to the mother whilst you dandled her offspring, 'Oh! such a pair were never seen, &c.'-If you can contrive to rub the child's dirty shoes against your white trousers, so as to leave a legible mark, it will do you much good-because the mother will say, 'Oh, Mr !-the child is spoiling your clothes;' you can then easily reply 'my dear madam, make no apologies, I am devotedly attached to children; nothing gains the heart of a mother so much as attention paid to her children; therefore coax the child as much as you can to play with your epaulette (if you have the honor to be in the army)-fortune may so far favor you as to induce the young one to pull one of the buttons off ;-that circumstance alone would insure you invitations during the winter. If the child be ever so ugly, remark that it reminds you (and sigh at the same time) of a 'lovely' little sister of your's, now alas! no more; after that observation you may 'book' yourself for a score of parties. But should the 'dear little innocent' be really pretty, and the mamma quite the reverse, you can still do some good by saying 'good God! madam, how greatly the child resembles you;' a congreve rocket discharged against a breast work could not have more effect than this remark of your's will have in the breast of the lady; she will tell her husband that you are a 'fine young man, and that she is convinced you have an excellent heart and disposition, by what she saw of your affection for children; so, although you may like children as 'the devil does holy water,' a little policy, and a few attentions well timed, will insure a flattering reception in every family; and you will then gain the first step in the profession of 'a lady's man!' FLORESTAN.

A pair of oxen belonging to Messrs Oliver & Levi Cowls, of Amherst, were weighed a few days since, and their joint weight found to be 4171 pounds. They were worked until May last, and were not fed with meal until the present win-

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

CULTIVATION OF HEMP.

of it as you think proper.

Hemp requires a deep and rich soil. Any atmanure, and a fertilizing course of husbandry, will result only in disappointment. Nor can it long be continued upon the same piece of ground, without soil, with an annual sprinkling of manure, at the or twice with his foot, in order to kick off the my own neighborhood. rate of eight or ten loads to the acre, it may be dirt, then I olding the whole loose in his hands, continued for a succession of years, without any lets the roots drop on the ground for the purpose material diminution in the value of the crop.

much in the same manner as for flax. It must be to lay the butts straight and true. This will greatploughed and harrowed sufficiently to break the ly facilitate the labor of binding. clods, and to render the soil fine and mellow. different soils require different degrees of labor to the same effect as upon mown grass. It discolproduce this effect, it must be left to the judgment ors it and injures its quality. It must therefore of the cultivator to determine when his ground is he suffered to lie upon the ground no longer than in a proper state to receive the seed. I can safe- it is necessary for its preservation. As soon as it ly say, that few farmers err, in ploughing and har- is sufficiently dried, which, in warm and drying rowing too much.

The time for sowing is about the 10th of May. A few days earlier or later will make no difference. It must not be so early as to expose the tender plant to severe frosts, and if sown late in May, it will produce a light crop-the stalks will have a thin coat.

The quantity of seed varies with the strength and condition of the ground. Two hushels is the usual quantity sown upon an acre-and this is generally sufficient. Some have used more, and upon very strong land have gone as high as three bushels. But I believe that few of our farmers have found their account in using a greater quantity than that first named. When it exceeds that quantity, the land must not only be strong, but it must be reduced to a very fine tilth. Otherwise, when it comes to grow, there will be a great deal of under-brush; that is, short, spindling, coatless stalks, of no value, and which will only be in the way, at the time of pulling. The seed is sown broad cast, and bushed or harrowed in, like flax.

No further attention to the crop is required until the season of pulling and cutting. Although the latter mode of gathering is attended with less former, as the most profitable. This commences about the 10th of August. The time of pulling is determined by the appearance of the hemp .-There are two kinds of home in every field, dis. water a little too long, or if, after it is drawn from whether it has lain in the water long enough, by

male. The latter produces the seed, the former nance of damp weather to prevent its drying, it the blossom and the farina. The male hemp has would be rotted too much, and the fibre would be but few and slender branches. When this has materially injured, if not destroyed. But when turned white, or a pale yellow, has shed its leaves, the hemp is immersed later in the season, after Ma J. B. Russell -I embrace the first moment and the faring has chiefly fallen off, then it is time the weather and water have become cool, there is of leisure, to give you, in compliance with your re- to pull it. The female hemp has more and strong- no risk in suffering it to remain in the water a quest, an account of the method pursued by our or branches, and continues fresh and green until short time longer than is necessary. It is also farmers, in the cultivation of hemp. It has been the seed is ripe. It is common to leave patches, supposed that when the hemp is rotted in hot raised in my neighborhood for more than twenty or narrow strips, where the seed hemp is most weather, there will be a greater proportion of tow years. It is considered as a sure crop; and at abundant, until the seed has ripened, which will -and after it is drawn from the water, the bands the prices which it has borne for a few years past, he about a month after the time of pulling; in must be opened and the hemp spread, in order affords a reasonable remuneration to the cultiva- which case, the economical farmer will pull out that it may dry quickly. It is also a busy season tor. In the account which I shall give, there will the male hemp as far as it is practicable; for the with the farme, and he can attend to it at a later probably be nothing new or instructive to those al. fibres of the hemp, that stands in the field until period, with less interruption to other branches of ready acquainted with the process. If you think the seed is ripe, are always stiff and harsh, and it will be useful to others, you will make such use will bring less in the market, than that which has been pulled at the prener se. son.

The pulling is a heavy jo's. One-fourth of an is necessary except to guard against breaking the of making that end of his handful even. And in The ground must be prepared for the seed, spreading his hemp on the ground, he is careful

Rain upon the hemp after it is pulled produce weather, will be after two days sun, it must be bound up in small bundles or sheaves. A little rve straw is the cheapest and best thing for bands. Let the band he put on towards the top of the bundle, and then shoved down to about the middle, otherwise it will be difficult to bind close enough to hold together, through all the subsequent handlings. Set up 15 or 20 bundles together, well braced at the roots to admit a free circulation of air, and to prevent it from blowing over, and let it remain in this situation, until it is ently to put into a stack or under covcured a may be done, in good weather, after two or three days. In the construction of the stack, great pains must be taken, lest the rain should find a passage into it. It is safest to put it under cover, either under sheds about the barn, or by erecting one for the purpose.

It may be asked, why not transport it to the place of rotting and immerse it in the water, immediately after it is pulled, or as soon as it is dry, and save the trouble of securing it from the weather? I am not prepared to say that this cannot be done with safety, under vigilant care and attention. It is believed, however, that it would be exlabor, our farmers almost universally adopt the posed to greater hazard of loss, than at a later period. At the time of pulling, the weather is hot, and the water warm. Putrefaction proceeds with

tinguished by the names of the male and the fer the water there should be a long rain, or a continhusbandry. These are the reasons which have induced our farthers to postpone the rotting till the latter part of Ogtober. - As I have never tried any experiments in reference to this part of the protempt to raise it upon a light soil, or upon land acre is considered as a day's work, though expert cess, and indeed have had but little experience in worn out and exhausted, until it is recruited by liands will pull a third of an acre. No precaution the culture of hemp on my own farm, I will not give an opinion whether their reasons are well stalks. The laborer gathers a few stalks in his founded or not. I have not undertaken to point hands and pulls them up, and having repeated out the best nethod, in relation to any part of the an annual supply of mannre. But upon a good this three or four times, he strikes the roots once process, but only to describe the course pursued in

It has sometimes been made a question whether running or stagnant water was to be preferred. The latter is more generally used in England .-The former has been universally applied here. A place is selected near the margin of some brook or small stream, which will afford a basin in which the henry can be deposited, and where, by erecting a dam across the stream, the hemp can be covered with water.

In the first place, the dam is built of a sufficient height to secure the requisite supply of water, leaving a gate way in the natural course of the stream, and the top of the gate a little lower than the height of the dam, to let off the surplus water, After the dam is completed, shut the gate and try the dam, in order to ascertain whether it is water tight, and will stand against the pressure produced by raising the pond. If it proves sufficient, then let off the water and put in the hemp. A space of two or three feet should he left between the hemp and the dam, so that if a leak should be discovered, there may be room to stop it. This precaution may be unnecessary in an old and long tried dam, but should not be omitted in a new one. Put down a layer of hemp, laying the bundles compactly, then a second course on the first, in a transverse direction, and so on successively, until the whole crop is deposited in the bed, or as much as the basin will receive. Weights, consisting of long and heavy timber, or plank, or slabs with stones upon them, must then be laid across the hed to prevent it from floating. Having deposited the homp and secured it from rising, the gateway may be closed and the water raised upon the hemp. It will be observed that the level of the hemp must be lower than the top of the gateway, so that the whole body may be immersed in water, and continued so, until it is rotted.

The length of time necessary to complete the rotting process depends much on the weather, and great rapidity. If the hemp should remain in the the temperature of water. It may be ascertained

ratted. So also, if while it lies in the water, the roots will twist off easily. Hemp put into the water the last week in October, will generally require about three weeks. When put in later, I have known it lie seven weeks. If put into stagis enough.

When the hemp is rotted, open the gateway and drain off the pond. The hemp must then be removed to a piece of grass land—the bundles laid upon the ground singly, and, after two or three days, turned over. When partially dried, it is carried and set up, inclining, against a fence, where it remains until it is fit for the brake. It may then be carried to the building or shed where it is to be dressed; or the brake may be carried to the hemp, as is generally the case here, and after it is broken, it is removed to the barn for the finishing process-or if the weather is not too severe, it may be dressed where it is broken.

A cheap vehicle or sled, for the removal of the hamp from the pond, may be made of two pieces of slit work, about 9 feet in length, with three cross beams of the same material. The stakes, driven closely through each beam and runner, will serve the double purpose of holding the sled together, and keeping the hemp from falling off .-No tongue will be necessary. It may be drawn with chains. If however the grass ground is at may be necessary.

In dressing, two brakes are used. The first, coarser than a common flax brake, the second, as fine as a flax brake at the head, with one additional bar in each jaw. If the hemp is well rotted and faithfully broke, but little remains for the swingling board. A man, accustomed to the business, will brake and dress from 50 to 75 lbs.

The labor required to prepare a crop of hemp for market, is not inconsiderable. But it will be observed, that but a small portion of the lahor comes at a season, when the farmer is most busily occupied in gathering and securing his other crops. The pulling comes on soon after the hay and grain are secured. The rotting does not commence till after Indian harvest, and the winter grain is sown. The dressing is wholly done in cold weather, when the farmer has little occupation besides that of taking care of his stock and providing fuel. Every considerable farmer who has land suitable for hemp, might raise a few acres, without greatly interfering with his ordinary course of husbandry.

The average crop is six or seven hundred to the acre. I have raised nine or ten-but this was an unusual crop. The land was strong, and in very fine tilth. The hemp grew to a great height and was very uniform throughout the piece. The price of hemp in market, has varied, of late years, from \$10 to \$12,50 a hundred. Scarce any crop of field culture can be put upon the land, which will produce so great a result.

It is not uncommon for the farmer to let out his land upon shares. In that case, the usual terms are, that the owner of the land prepares the ground, and furnishes one half the seed. The ocin, and returns to the owner one-half of the seed, early potatoes, which appears to me an extraordi- requisite?

it. If the seed cracks easily, and the rind, or harl one instance, I have received, for the use of my readily separates from the wood, it is sufficiently land, more than forty-five dollars an acre, clear profit. The moiety of the seed returned to me, was amply sufficient to pay my part of the seed furnished, and the labor of preparing the ground.

The hemp grown in this neighborhood, when well dressed, commands the highest price of the nant water, soon after it is pulled, five or six days best Russia bemp, and is as readily purchased by the manufacturers of cordage. Our farmers sometimes mistake their own interest, by neglecting to hatchel out the tow, through fear of too much diminishing the weight. An experiment was made in 1824, by direction of the Commissioners of the Navy, to try its strength in comparison with the Russian. "Two ropes, each 21 inches in circumserence, one made of hemp grown in this town, broke with 3209 lhs. The other made of clean St Petersburg, broke with 3118 lbs." mention this fact for the purpose of satisfying the doubting, if any such there are, that our soil and climate are as well adapted to the cultivation of this article, as those of Russia, and that no one need be deterred from entering upon its cultivation, under any apprehensions, that his crop, if rightly managed and well prepared, will be of inferior value.

At a time when the supply of the ordinary products of the farm, exceeds the demand, and consequently the price is so low, as almost to discourage agricultural enterprise, it deserves the consideration of farmers in different parts of the any considerable distance from the pond, wheels country, whether their interest does not require them to turn a part of their land, and to apply a portion of their labor, to the cultivation of hemp. The annual import from Russia, does not probably fall short of half a million of dollars. This amount might, in a short time, be brought to market, from er classes, and is a regular article of sale for that oor own soil. In addition to this, we annually import in duck, and other manufactures of hemp, exclusive of cordage, to the amount of more than a million and a half of dollars. These manufactures might be carried on in our own country, as well as those of cotton or woollen goods. The present rate of duty on imported hemp is \$45 a ton, which is sufficient to afford adequate protection, to the extent of the demand. If the continuance of this duty should not come within the rule prescribed by our present chief Magistrate, which "requires that the great interest of agriculture, commerce, and manufactures should be equally favored," it may perhaps come within his exception to the rule, of giving "peculiar encouragement to any products of either of them, that may be found essential to our nation indepen-I am yours, & SAM, LATHROP.

DEGENERATION OF POTATOES BY IN-TERMIXTURE.

MR EDITOR-I expressed a strong conviction in a late number of your Journal, that there was not the slightest foundation for the opinion that tion) relative to the cultivation of Mustard, (Sinapotatoes degenerated by juxta-position, or being pis.) Answers to the following questions through planted even in the same hills. I remarked that I had never seen it suggested in a European work. I would now ask leave to state, that in Loudon's Magazine, No. xi. is the following paragraph in cupant furnishes the other half of the seed, and a communication to Londou. "I observed in Cobperforms all the labor, after the seed is harrowed bett's American Gardener an assertion respecting

taking out one of the bundles, drying and braking and one half the hemp, prepared for market. In nary one. He says that if you have got the true 'You must take care that no other sort grow with or near it, for potatoes of this kind mix the breed more readily than any thing else, though they have no bloom'!! Will you be kind enough to tell me through the medium of your Magazine, whether the statement of Cobbett be really correct?"

To this Loudon briefly answers-" Not correct."

We have then Mr Loudon's testimony (and better authority cannot be found,) and testimony of the querist who thought the operation extraordinary, in corroboration of my opinion. Let me add, my experience applied precisely to early potatoes, which have been planted promiscuously for many years without deterioration or change.

I will now, make a remark which I have frequently made to you, Mr Editor, in conversation, that I know of no guide more unsafe than Cobbett's American Gardener. Not that it is destitute of merit-not that it does not possess some of the best traits of Cobbett's works, but it has many mistakes, and partakes of the defects of Cobbett's writings as well as of their beauties.

FOR THE NEW ENGLAND FARMER.

NUT TREES.

Sir-It seems astonishing that two such valuable fruit trees are so little cultivaled as the Spanish Chesnut and the Madeira Nut, or English Walnut. The former produces very large fruit of excellent quality, in the greatest abundance, and in the South of France, Spain, Portugal, and Italy, it forms a most valuable article of food for the poorpurpose. It is but seldom this fruit finds its way to our markets from Europe, but a plentiful supply might easily be furnished by planting orchards of this tree, the same as we do with the appleor by planting them along avenues and highways, and there is no doubt they would as well repay the proprietor as an orchard of any other kind.

The Madeira nut may be planted in the same manner, and would yield also an ample remuneration, as the nuts are sold, when green, for a dollar the hundred, for pickling; and when ripe, are in HORTUS. great request for the table.

Trees of the Spanish Chesnut, with large eatable fruit, can be delivered at the New England Farmer Seed Store, Boston, at from 50 to 75 cts each, or \$40 per 100-with the addition of the cost of freight from New York, which is but trifling. The Madeira nut at the same price.

FOR THE NEW ENGLAND FARMER.

MUSTARD.

MR FESSENDEN-I wish to make inquiry through the medium of the New England Farmer, (of any gentleman who may possess the informathe New England Farmer, as soon as convenient, would be very gratefully received.

1. What soil is best adapted to its culture? 2. Its preparation and time of sowing-quanti-

ty of seed per acre, if sown in drills?

3. What attention to weeding and hoeing is

the time necessary to harvest?

WEB WORM ON FRUIT TREES.

Mr Fessenden-Your repeated exhortations to the orchardist to attend to the clearing their fruit trees from that disgusting and destroying insect the caterpillar, I believe have not been without effect; but there is another insect, perhaps of the same genus, and equally noxious, which among the various communications on the arboreous insects, I do not recollect to have seen described, or noticed by any one. It is here (without reference to entomological science,) designated as the Web worm. It is about the size, and in some measure resembles the Canker worm, in appearance, but uot in its habits or origin. It does not make its where it is with difficulty approached; and there pillar it never leaves its nest in quest of forage .-If left undisturbed, it does not often extend its which it devours the foliage, and what I believe depredate seldom vegetates again. Whether this is owing to something poisonous in themselves, or to the season when they strip the branch of its leaves, I am ignorant. I think I recollect but one instance, of seeing any branch, on which they had built their nest, vegetating again; and that threw out some feeble leaves, but has never blossomed or bore fruit.

The object of this communication is not to inquire what is to be done, for it is obvious it only remains to amputate the limb and burn it, But if any of your correspondents know, or can discover hardly worth publishing, and some worse than the Procreator of this worm, so that we can attack circle of more than 300 feet in circumference, nothing. Among the last, I think may be num- it in embryo, he may facilitate our means of ex- covering 7,500 square feet of surface-Con. Mir.

sect is indispensably necessary to lead to some method of preventing their depredations, or of effecting their destruction.

Plymouth, April 2, 1829.

NEW TABLE PEAR.

We acknowledge the receipt of a package of scions from LOVETT PETERS, Esq. of Westboro', Ms. who gives the following account of their character, in a note to the publisher of the New England Farmer. "This is considered a native fruit, and is called the Lyscom apple, from the person who raised it-is very large, striped, flesh white, spicy taste, fit for the table in October, and I think second to none for excellence." The scions have all been gratuitously distributed.

BURNS.

In looking over the Alleghany Democrat, of the 29th December, I discovered a small paragraph on burns, stating that the immediate application of the simple article of wheat floor to the part affected was discovered by Dr Michael Ward, of Manchester, England, to be a speedy and effectual cure. I bore it in mind, that the first opportunity offered I would test the virtue of the remedy .-On last evening, my little daughter, about 11 years old, was unfortunately badly scalded on one leg and foot, by the oversetting of a small vessel of sealding water. I immediately applied a handful of wheat flour, to the scalded part, and wrapped it up with a cloth; the child was in great agony and pain; in about 20 minutes she began to be a little eased of pain; I then removed the first application of flour, and as directed by Dr Ward, covered the affected part twice more, at intervals of about 15 minutes, by sprinkling on by a flour dradger. The pain was entirely removed in half an hour; the patient slept sound all night, and, as she expressed herself, she did not recollect she was burned, until she went to rise in the morning. My reasons for stating these facts are, that I wish every family to know this speedy and effectual cure, as in every house the remedy is at hand, and much misery may be prevented by its use. - Pittsburg Gaz.

The last number of the North American Review contains articles on the following subjects-The New Theory of the Earth-College Education-Ancient and Modern History-Pollok's Course of Time-Civilization and Conversion of the Indians-Political Economy-Ilistory of the Louisiana Treaty-Pelham-Webster's Dictionary-American Annuals-Elementary Instruction -Clerical Manners and Habits-Massachusetts Rail Road. FOR THE NEW ENGLAND FARMER.

OAT GRASS.

MR Entron-Allow me, through the medium of your paper, to submit, for the consideration of my brother farmers, a few remarks on the culture of the Tall Meadow Oat Grass, (Avena elatior.) I have not been able to discover its origin. It differs from the Meadow Oat Grass, Avena pratensis, mentioned by Sinclair, and other English writers. Of this fact I am satisfied from an inspection of the Avena pratensis exhibited in Sinclair's celebrated work upon grasses, (Hortus Gramineus Woburnensis, page 312) as well as from the description therein given of the same. The latter grass, is, no doubt, a native of England. And some of the English writers describe it as rather coarse, and possessing nutritive qualities in a less degree than some others. The resemblance of the English Meadow Oat, (Avena pratensis) to the Tall Meadow Oat, (Avena elatior) cultivated in this country, may be considered perhaps as the cause, why the indifferent qualities of the former have been ascribed to the latter by some writers on the subject in this country. From the circumstance of its having been first introduced among the German farmers of Pennsylvania, I am inclined to believe, with Justin Ely, of West Springfield, that the Tall Meadow Oat Grass, cultivated in this country, is of German origin. I am confident it is not contained in the list of grasses described by Sinclair, and doubt if it was known in England when he wrote.

The attempts which have been made in this part of the country to cultivate the Tall Meadow Oat Grass, I suspect have not been upon a scale sufficiently large, nor under circumstances which furnished a fair test of its qualities. As far as I have been able to learn, the experiments in this vicinity have been made upon small patches of rich and highly manured soil, thinly sown, and suffered to stand in the field for some weeks after flowering, for the purpose of ripening the seed. The produce has therefore been what might under such circumstances, have been expected, rather coarse and "strawlike." With similar treatment the result would have been the same, every farmer must be aware, with any of our common grasses.

I have cultivated this grass for seven years past, mostly upon a thin soil, lightly manured, in fields of from one to four acres, and am fully satisfied of its excellent qualities, either as a hay crop or for grazing. I was induced to make the trial from an account of it, given by Col. Taylor, of Virginia, a very distinguished practical as well as scientific farmer. After fifteen years experience, Col. T. states in a communication to the Virginia Agricultural Society-" It is the hardiest grass I have ever seen, and bears drought, and frost, and heat, and cold, better than any I have ever tried. It keeps possession of the land in spite of severe grazing. It furnishes better grazing early in the spring, late in the fall, in drought, and in winter, than any grass known to me."-"Alone, cut before the seed ripens, its hay is as nutritive and pleasant to stock of all kinds as any I have ever used."

cattle prefer this hay to all others, but some horses If it will, is it by planting the seed or by cuttings? do not like it green. If suffered to grow old before being cut, it will become strawlike."

for grazing. From its early flowering it is pecugrown, commonly about the first of June.

of red clover, and 2 of white clover seed to the acre. The soil was thin and had been exhausted by long cropping. I intended it for pasturing, but in the spring it looked so promising, I concluded wait six or seven years for their growth. to mow it the first season. On the 3d of June, 1828, it was cut, and gave me two tons, to the acre, of the finest and best hav, either for cattle or horses, I have ever had in my barn.

When sown in the spring either alone or with a grain crop, of barley or rye, it should be liarrowed and rolled in, and not less than three bushdoes not suffer by a sudden exposure of the ground to the sun, by taking off the crop of grain in the hottest weather. It is peculiarly well adapted for grazing on poor and exhausted lands, as well as upon those of a richer quality. It comes forward in the spring as soon as the frost leaves the ground. at least a fortnight earlier than our common grasses, and through the dryest weather of the summer exhibits a green and inviting appearance. bushels of well cleaned seed.

Respectfully yours, E. P. Lexington, April, 1829.

FOR THE NEW ENGLAND FARMER

THORN BUSHES; TOBACCO; CABBAGES. AND FRUIT TREES.

MR FESSENDEN-I have a small farm of about 75 acres; and all my fence is of wood, and going to decay very fast. Indeed the repair of my fences yearly amounts to more than 6 per cent. on the whole produce of my land. I have, perhaps, about stone enough to make what fence I should want for the whole farm, but they lie scattered through a fine young wood lot, and cannot be come at but by digging and blowing, which would, I think, spoil my wood lot. In this state of affairs I had concluded to sell out, and go to the land of promise in the western country. With these notions in my head, about two years ago I took a pretty long ramble in the state of New York, spent money enough to have repaired my fences for one year, -- satisfied myself that by prudence and industry I might be full as happy, if fences: not quite as rich here as in the western countrycame home and sat down more contented-subscribed for your valuable paper, and have read it as I think, to much advantage to my farm and to myself.

Dr Muhlenburg of Pennsylvania, says "This you, nothing doubting. Will you, or some of middle of May, (with us the first of June) and I believe throughout the country, and on every var inreads of cattle. Mr Tibbets, of Renssellaer Coun-

rises to the height of from 5 to 7 feet. Horned riety of soil, will answer for hedge or live fence? At what time should they be cut? Or if by seeds, at what time sown? What distance should they The character given of this grass by the above be set apart in the rows, and what distance the writers is fully sustained by the experience I have rows? Is the manner of treatment the same as had, both as it relates to its qualities as hay, or with the English hawthorn? Or any other information would be thankfully received. liarly well suited to be sown with red clover. It have in this part of the country, large tracts of is fit to be cut just at the time the clover is full land, where stone for fence cannot easily be procured, and timber has become too valuable to make In the spring of 1827, I sowed with barley a fence of. If we can procure from our own forfield of four acres, and put on 21 bushels of oat ests a good live fence, we may hope in time, some grass seed, (3 would have been better) 5 pounds of our farmers will make the experiment. But I fear it will be a long time before we shall have good fences here, on our pine lands, if we must pay money (though but little) for the cuttings, and

I have been very much troubled for some years, with lice on my cabbages and turnips. By the advice of an old gentleman, last season, I set out a few tobacco plants among my cabbages and turnips, say the plants about one rod apart. I had no lice in my garden that I could find. The tobacco grew well, and were fine plants. Had I els of seed to the acre. It vegetates freely and known how to cure it, I think I could have raised my own tobacco, which costs me about five dollars per year. I find nothing in your paper about curing tobacco, and my neighbors are as ignorant as I am. Now, sir, if you will give us such directions about raising and curing tobacco, as to enable us to furnish our own from our own farms, we shall be much obliged to you, and I will promise to lay out seventy-five per cent. of such saving in books of agriculture, at the New England It yields an abundance of seeds. I took the last Farmer office. Quere, would a few tobacco plants season from 3 of an acre (sown in the fall of set among our melon and squash vines prevent 1824) of ground, in tolerably good heart, over 20 the bugs from destroying them? What would be the effect on the vermin, which destroy our young fruit trees, to plant tobacco at their roots, and leave it on the ground all winter, or by cutting it up and curing it (if we know how to do it cheap) and spreading it round the tree in the spring, or any other season of the year.

MERRIMACK RIVER.

March 21, 1829.

Remarks by the Editor .- We will make a few observations on the foregoing queries and suggestions of our correspondent; premising, however, that we shall not attempt fully to satisfy all his inquiries, nor fully to investigate all the subjects which he proposes for discussion. And first with regard to Hedges. We do not believe that live fences will be found useful except in a thickly populated part of the country, where stone cannot easily be obtained, and timber is scarce and dear; or, perhaps, in some instances, to inclose gardens and barricade them against human as well as brute animals. The following are some of the disadvantages, which attend the cultivation of live

Live fences take from cultivation all the land on which they grow, and when at maturity send their roots in search of nourishment on each side of the row at least five or six feet; exhausting the soil and shading that part of the crop, which is near I see, sir, in your paper, that my brother farm- them. Live fences generally require dead fences, ers when they want advice or information go to such as posts and rails, what is called Virginia fence, or something of the sort for several years. grass is of all others, the earliest, latest, and best your correspondents, be so good as to inform to protect the young hedge plants while growing for green fodder or hay. It blossoms about the whether our common thorn bush, that grows wild, to sufficient maturity to form a barrier against the

should be kept free from weeds and grass for at as they appear. least the three first years, otherwise they become quire from six to ten years."

The expense of such protecting fences, may, however, be avoided by not suffering cattle, hogs, ing a live fence within a dead fence already standing on the premises.

Another disadvantage attending thorn fences is, that they are liable to be destroyed by the apple tree borer, and are annoyed, we believe, by the caterpillar. Breaches in hedge fence, made by these or by other means, can only be repaired by a dead fence, or by setting other plants, which are many years in acquiring the requisite growth and strength to stand without protection. Moreover the young plants never thrive well between the old ones. We believe, likewise, that there are very few hedges, which present an adequate barrier against swine. Another very strong objection against live fences is that they cannot be the flesh is perfectly melting, juicy, and sweet .moved. This may be important, not only in con- Specimens from the garden of John Ludlow, Esq. sequence of the changes in form and disposition of did not keep beyond the last of October, but some lots, &c. which the owner might wish to make during his life, but after his death it may become till the end of November. Mr Parmentier, in some necessary to divide the farm among his heirs, and manuscript notes says that it will continue in eatin that case a live fence prevents or renders very ing from January till the beginning of May .- Londifficult the partition, which circumstances may don Hort. Trans. vol. v. part iv. require. A consideration of these objections to hedges has made us almost a convert to the opinion of Dr Cooper, who, in the last Philadelphia ing the extreme difficulty of preventing confusion edition of Willich's Domestic Encyclopedia, says, in names even of recent fruits, the origin of which parisel." ty, N. Y. says "It is indispensable, that plants put afforded. Let the suckers, which shoot out from pear has been given. We now add, that it has the high character before given of it. In the The ripeness of tobacco may be known by small former notice it was said to resemble the Chan-

9. The Forelle. This is the same as the pear called here the Florelic. It was probably a slip of stick, and thus suspending them across a pole, at named Forelle (or Trout) from its bright color, logues under its translated name, Poire truite, for little damp, strip them off, pack them in casks, more oval. Skin bright yellow, very deep red on dish ring, giving to the whole fruit a remarkably beautiful appearance. The flesh quite melting, without grit-juicy and very sweet bot without perfume. It ripens in November and will probably keep longer. It is not a pear of the first class, although possessing very considerable excellence, but its extraordinary beauty will always recommend it for the dessert.

10. Riche Depouille. It resembles the St Germain in shape and size—it is well rounded at the eve, which is somewhat prominent, and tapers considerably towards the stalk, which is rather thick, and about an inch and an half long. The skin is of a clear citron (or lemon) yellow, with a slight tinge of scarlet on the exposed side, a little mottled with russet, and the whole rough like the skin of an orange. The flesh is white, melting, not perfuned, but sweet and very pleasant. [Time of ripening not noticed. I have not heard of this pear in this country.]

11. Passe Colmar-raised by M. Hardenpont of Mons. Dr Van Mons also calls it "Fondante de pering towards the stalk. Skin pale green, slightly marked with red on the exposed side, and sprinkled with minute green spots. Flesh yellow-There are, however, no doubt, situations and Dr Van Mons, the Colmar Deschamps, having ish, melting, though not buttery, very juicy, and extremely sweet. It keeps well to the end of December, and even later.

12. The Passe Colmar gris de Precel-(that is the Grey Passe Colmar of Precel.) This pear was raised by M. Precel, of Enghien. It is larger than the Colmar, and more irregular in shape. The skin is dull yellow, with a tinge of brown red on the exposed side, and is spotted with a few patches of brown. The flesh is white, of the texture of the Colmar, and juicy, extremely sweet, and agreeably perfumed. I have not tasted it,

13. Beurre Diel-raised by Mons. Van Mons, and named in honor of Dr Diel, author of a celebrated work on Pomology, or Fruits. It is as large as a fine Summer Good Christian, and resembles it in shape. Skin is smooth-flesh white and melting, with a rich sweet juice-ripens in November, but will keep through the whole of December.

14. Urbaniste-raised by Count Coloma, and has been fruited by Mr Braddick and Mr Knight. the size, in order that good thick leaves may be La Bonne Malinoise. Some account of this Egg shaped-very even in form-eye a little sunk

vellow, profusely spotted with greenish spots, and having small patches of thin russet dispersed over its whole surface, but more abundantly round the eye and stalk. Flesh is white near the outside, but deepens to a reddish vellow next the core, but without perfume. The specimens we have received have not kept beyond October.

(To be continued.)

NEW ENGLAND FARMER.

BOSTON, FRIDAY, APRIL 10, 1829.

NOTICE.

Mr J. B. Russell, the publisher of the New England Farmer, has been appointed general Agent for the Massachusetts Horticultural Society. Any trees or scions of superior fruits, seeds of rare and fine vegetables or ornamental plants, drawings of fruits, books for their library, and donations intended for the Society, may be consigned to his care. Scions of valuable fruits, and seeds of rare vegetables, thus presented, will be distributed gratuitously among the members. And it may be that the gratuitous distribution of all such articles will be limited to its members, as those who support such an institution must be the first to enjoy its benefits.

The expenses of membership are two dollars per annum, in addition to the admission fee of five dollars.

DR THACHER'S TREATISE ON THE MANAGEMENT OF BEES.

The generality of mankind do not appear to be sufficiently aware of the importance of the HONEY BEE to the interests, health, convenience and comfort of mankind. Wax and honey, either in simple substance, or in their numerous and useful compounds are so nearly indispensable that they will be obtained by civilized people, though the cost were ever so disproportionate to what ought to be their standard value. If, in consequence of our indolence, ignorance, or inattention, we do not keep and properly manage Bees in the United States, we must, or, at any rate, we shall, pay a very considerable tribute to foreign countries, for the produce of these industrious and valuable insects.

The profit derived from the cultivation of Bees is little less than clear gain to the community, and to the individuals who raise them. The insects consume scarcely anything except that fragrance which would otherwise be "wasted on the desert air." But very little capital is necessary to enable any person to set up the business of an Apiarian or Bee Manager. The chief requisite is knowledge, or that kind of information, which will enable every person of common capacity to direct and take advantage of the instincts and endowments of the little artists. This information it appears to us, may well be acquired from Dr Thacher's

Time was when almost every farmer in New England kept Bees. Now they are almost as rare as roses in January. An enemy has arisen and has nearly expelled the "little friends" of the cul-

-stalk about an incl. long, inserted in a cavity of Bee Moth, Phalena (Tinea) Cereanea, according but moderate depth-skin pale green, inclining to to Dr HARRIS. Dr THACHER has devoted a chapter to the "Best method of destroying or pre-venting the depredations of the Bee Moth." This chapter alone, we should suppose to be worth ten times the cost of the book to all, who have or propose to possess bees. We shall not quote the which is large and possesses a small quantity of chapter, nor any part of its contents, lest we should grit. It is quite melting, juicy, and very sweet, infringe on the copy right of the publishers, or lessen the inducements to purchase the treatise.

> Dr Thatcher, in this work on Bees, has given proof, in addition to that exhibited by his " Orchardist," that he has a rare talent at conveying useful information on scientific topics. His arrangement is methodical, his selections judicious, and his original information clearly expressed. He does not indulge in useless details, but is sufficiently copious and circumstantial to be perspicuous, at the same time so concise as not to be tedious. We hope his Treatise may be extensively circulated; and if so, we think it will save more money to New England than the price of all the agricultural books, which were ever printed in the United States.

The Garget .- A correspondent of the Vermont Watchman states that an experienced farmer having told him that tar, put upon the ridge between suggested as an inducement to join the Society, the horns of cows, and on the nose, would cure the garget—he has tried it on many cows, and personally, by the proprietor. The following comprises has never known it fail of a cure.

Orders directed to Samuel Hyde, Newton, will be promptly attended to. Trees will be delivered in Boston free of expense for transportation. Catalogues furnished graits by J. B. Russell, No. 52 North Market Street, Boston, and at the Nursery in Newton. 4t

March 27

Bees.

Just published by MARSH & CAPEN, 362, Washington Street.

A PRACTICAL TREATISE ON THE MANAGEMENT OF BEES; and the establishment of an apiary, with the best method of destroying and preventing the depredations of the BEE MOTH. By JAMES THACHER, M. D., Fellow of the American Academy of Arts and Sciences, &c.

Extract from the Author's Advertisement.

"The destructive ravages of the BEE MOTH have in many places almost annihilated our Bee establishments, and discouraged all attempts to renewed trials. Not less than one hundred hives have, the past season, been entirely destroyed by that enemy, within a lew towns in the county of Plymouth, and in places where a single hive has yielded one hundred pounds of honey. From a particular investigation of this subject, the compiler is now able, with much confidence, to announce, that an effectual preventive of such depredations will be found recorded in this production." Price 75 cents.

March 27

Red and White Clover Seed.

For sale at the New England Farmer Seed Store, No. 52 North Market Street,

5000 lbs. Red Clover Seed,

March 27

500 lbs. Dutch White Honeysuckle Clover, (imported.) Also, Herd's Grass, Red Top, Orchard Grass, Lucerne, Foul Meadow, Hemp and Flax Seed, &c, &c.

Seeds for Country Dealers.

Needs for Country Dealers.

Traders in the country, who may wish to keep an assortment of Garden Seeds for sole, are informed they can be formished at the New England Farmer office, No. 32 North Machanitat, Boston, with Boxes containing a complete assortment of the seeds mostly osed in a kitchen garden, on as favorable terms at they can be purchased in this country, neatly done up in soall papers, at 6 and 12 center self—warranted to be of the growth of 1828, and of the purest quality. Organizata, Plower SERDS will be added on the sance terms, when ordered, as well as Peas, Bears, Early Whith Swelt Corn, &c., of different sorts.

MISCELLANIES.

The Winters of New England .- 1741. The winter of this year was bitter, and its severity widely felt. The following paragraphs from the Pennsylvania Gazette, will show the distress which was experienced even in the regions now visited gently by the winter's cold. " Philadelphia. March, 1741. Our accounts from all parts of the country are filled with complaints of the severity of the winter, no one remembering the like. The cattle are dying daily for want of fodder: many deer are found dead in the woods, and some come tamely to the plantations and feed on hay with other creatures." "New York, Feb. 3, 1741. By our accounts from the country, the people here are in so great want of fodder for their cattle, in several places, that four cows are given to have one delivered in May, and that the cold has been so severe, that even deer, squirrels, and birds have been frozen to death, and great quantities of sheep have perished, and this day wood has been sold for 40 shillings per cord."

1764. The snow fell in great quantities during February and March. It is within the recollection of some of our ancient inhabitants that during the month of April, oxen and sleds heavily loaded with the materials for the Old South Meeting House, in this town, passed upon the surface of the snow, frozen into a thick crust, over the places where fences were buried in the drifts, without obstruction.

1772. The Boston Gazette states, that the winter had been more severe than had been known for many years. Great storms of wind and snow came until April.

commenced in November, and continued storms accompanied with violent winds from the N. East, occurred during December. About the first of January, a period of steady and severe cold commenced. During forty days even on the south and sunny side of buildings in warm situations there were no indications of thaw. The light and dry snow drifted and eddied with incessant motion on the wind. Paths, if opened, were immediately filled, and communication was almost enthis town, contains the following notice "Worcester, Jan. 6. For twenty years past the travelling has not been known to be worse than at present. The mails due last week have not yet arrived. We week." "Jan. 13. A gentleman who arrived were carried on small sleds .- National Egis. here yesterday from Boston, which place he left Friday last, (Jan. 7,) informs us that the storm was very severe there, and that between this and the capital, not less than 80 teams were stopped." "Jan. 20. Travelling has not been so much obstructed by the snow for forty years past. Except the great post road from Boston to Hartford, all are filled, and no passing without snowshoes." "Jan. 27. Wood is now sold in this town at the rate of sixty dollars the cord, owing to the roads being filled with snow. A poor man belonging to a towa near Providence, began to remove his family, consisting of his wife and nine children, to a place called New Providence, about a hundred miles from this place, the day before the beginning of the late storm; he had got only as far as Mendon, where he was obliged to remain three weeks, and having expended all his have offered premiums to the members, for the

from Mendon to this place remaining impassable for cattle, a number of men on snow shoes assembled and dragged his sled, on which were his wife and family, and the few effects he was possessed of, as far as Grafton; from that place sixty-one men belonging there, brought them in the same manner to this town; some of the charitable inhabitants set on foot a subscription for their relief, and in about two hours collected £150, and having procured a team, on Monday last, they continued their journey. So singular a circumstance is not remembered in this part of the country."

On the 27th of February, Mr Thomas, the printer of the Spy, " returns his sincere thanks to those gentlemen in this, and a few of the neighboring towns, who have continued to take his papers during the late tedious weather; as the roads Jargonelle, in many parts of the county, still remain impassable on horseback, and too many of his customers think it tedious to come for them, unless they could ride, it has reduced the late impressions of this paper to such small numbers, that the cost of printing them has been three or four times as much as the printer has asked for them when printed .-This only, and not a want of interesting intelligence occasions the appearance of half a sheet, and obliges the printer to suspend the publication of this paper until Thursday, the week after next."

In the MSS of Mr French, cited in Abbot's History of Andover, it is stated the snow was four and a half feet deep, in the woods, on a level .-The roads were so filled as to be impassable for a long time, except with the aid of snow shoes .-Fences, and low buildings were buried beneath deep drifts, and the inhabitants of contiguous 1780. The snows of this memorable winter houses communicated with each other through arched passages, hollowed under the drifts. After the surface was frozen, instances are stated where the dead were taken from the chamber windows to be carried to the grave. The sufferings of the inhabitants were great. The scanty supply of fuel for many days could only be brought on hand sleds, and the stumps of trees which were cut even with the surface of the snows, on their dissolution stood many feet above the earth. A row of shade trees which ornamented the north end of the tirely interrupted. The Spy, then published in street in this town, were destroyed to supply the necessities of the people. The streams were so much choked as not to flow in their usual channels, the rivulets disappeared under the drifts, and great distress was felt for water. All travelling therefore give our readers but half a sheet this was for a long time on snow shoes, and burthens

> Dr Herschell .- In order to show the steady perseverance which enabled Herschell to attain the celebrity he enjoyed, Mr Davies, the lecturer at the Manchester Mechanical Institution, related an anecdote which he said had been communicated to him by a gentleman who was acquainted with the distinguished astronomer: in the early part of his astronomical career, he had been engaged for several weeks in grinding a glass lens for one of his telescopes, and was so unfortunate as to break it when it was nearly completed; but, instead of being irritated or disheartened by the accident, he merely observed, in his broken English, "Vell, 1 must make anoder," to which task he applied himself without delay.

The council of the Albany Horticultural Society money, was drove to great necessity. The road best and earliest fruits, vegetables, and flowers.

Scions of Apple and Pear Trees. For sale, at the New England Farmer Seed Store, No. 52 North Market street, Boston, a large collection of Apple and Pear Scions,-among which are the following:

Apples. Gardener's Sweeting. Roxbury Russet, Nonsuch, New York Pippin, Baldwin, Grand Sachem. Cat-head, or Large Sum-Gilliflower, White Shropsavine, or ? Rhode Island Greening, Early Harvest, &c, &c. Pears.

Heathcot, St Germain, Rushmore's Bon Cretien. Spice Rousselet, Red Bergamot, Moor Fowl Egg,

Large Iron, or Pound, Gansel's Bergamot, Brown Buerre. Early Juneting, St Michael's, Broca's Bergamot, Bartlett. &c, &c.

In addition to the above, we are daily procuring fine varieties, from responsible sources, and hope to extend the collection so as to comprise all the esteemed fruits raised in the vicinity of Boston and New York.

The scions are in fine order, and the utmost depen-

dence can be placed upon their genuineness, as they are all cut from bearing trees. eptf

Fruit Trees.

Messrs WINSHIPS respectfully request Messrs WINSHIPS respectfully request those of the public who may incline to favor them with their orders the ensuing season, for fruit and ornamental trees, fancy shrubbery, herbaceous plants, whether indigenous or ex-

otic, to forward their orders immediately, and they will be executed with every possible despatch. They also have several hundred genuine Isabella Grape Vines, by the hundred or single plant, with the superior European kinds in cultivation in this country. Letters directed to F. & I. Winship, Brighton.

P. S. Asparagus roots from one to four years old. All orders left with J. B. RUSSELL, at the New England Farmer Seed Store, 52 North Market street, will be executed at the Nursery prices, and the trees delivered in Boston, free of expense for transportation. Brighton, March 11, 1829.

Assorted Seeds for Families. For sale at the New England Farmer Seed Store small boxes of assorted Seeds for Kitchen Gardens. Each box contains a

package of the following Sceds: Early Washington Pens Dwarf Blue Imperial Pens Late Marrowfat Pens Long Dutch Parsaip

Early Mohawk Dwarf string Pine-apple Melon China Dwarf string and shell Nasturtium Beans

Beans Lima, or Saba Pole Beans Long Blood Beet Early Turnip-rooted Beet Early York Cabbage Large late Drumhead Cabbage White Turnip Radish Cape Savoy Cabbage Red Dutch Cabbage (for pickting) Early Horn Carrot

Long Orange Carrot White Solid Celery Curled Cress Early Cucumber Early Silesia Lettuce Large Cabbage Leituce Long Green Turkey Cucumber Long, or Round Watermelon

Large White Onion Large Red Onion Curled Parsley
Flat Squash Pepper
Early Scarlet Short-top Radish Salsafy Early Bush Squash

Early White Dutch Turnip White Flat Turnip Yellow Stone Turnip Winter Crook-neck Squash. POT HERB SEEDS. Thyme-Sage-Marjorum.

The above list, it will be seen, comprises all the common vegetables, besides several new varieties of recent introduction, and uncommon excellence. Every kind is warranted of the very first quality, as to freshness and purity. Each box contains directions for the management of the different sorts. Price \$3 per box.

Pressed Culinary Herbs.

For sale at the New Eogland Farmer Seed Store, No. 52, North Market street, Culinary Herbs, dried, pressed, and neatly packed, in parcels, at the following prices: —Sweet Marjoram, 50 ets—Summer Savory, 25 ets—Thyme, 33 ets—Sage, 17 ets—Celery, (in bottles for soups, &c.) 25 ets—Balm, 33 ets—Rose Flowers, §1,00.

Published every Friday, at \$3 per anoun, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.
Printed for J. B. Russell, by I. R. Butts—by whom all descriptions of Printing can be executed to meet the wishes

of customers. Orders for printing received by J. B. Russell, at the Agricultural Warehouse No 52 North Market Street

NEW ENGLARD FARMER.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

NOTICES OF THE NEW PEARS.

(SELECTED FROM FOREIGN WORKS.)

(Continued from page 302.)

London Hort. Transactions, vol. vi. part iii. Bryan Edwards' pear. Capt. Peter Rainier sent specimens of a seedling pear of considerable excellence. It resembles the Easter Bergamot in shape and color, but is melting with a little grit at the core. It ripens in the beginning of November, is rich, sweet, and pleasantly perfumed, and is an excellent bearer. It was found growing wild in the neighborhood of Southampton, by the late Bryan Edwards, Esq. (author of the History of Jamaica.) It has been named Bryan Edwards' Pear. The original tree is hardy, and produces a gathered before it is ripe. [This tree I believe has not reached this country.—J. Lowell.]

Tindall's Swan's Egg. Messrs. G. & W. Tin-

dall, of Beverly, Yorkshire, sent specimens to the Egg, which succeeds well in that neighborhood [a cold northern one.] It is larger, and browner than the common Swan's Egg, and equal to it in flavor. It keeps well till the end of January, and

us.-J. L.] London Hort, Transactions, vol. vii. part i.

Duchesse D'Angouleme. [So named from the daly surviving child of the late Louis XVI. and his unhappy queen, Marie Antoinette, and their companion in the Temple.] This pear was sent some years since by M. Noisette, from Paris, and since from Jersey. It is of a roundish oblong figure, tapering towards the stalk, with an extremely uneven knobby surface. Both the eye and stalk are ter three one-balf by three .- J. L.] deeply sunk in an irregular cavity, the stalk being about one-fifth the length of the fruit, which gencrally measures about 3 inches and an half each new pear as yet noticed in the Annales d' Hortiway, but sometimes acquires a much greater size. The colored figure now before me is larger than middling pound pear, and must have weighed from its first name, Poire de Monsieur Le Cure, be-12 to 16 ounces,-J. L. The skin is pale vellow, copiously, and regularly spotted with broad russet |cultivation.] marks. The flesh is yellow, quite melting, and most agreeably perfumed. This is not only a variety of the first excellence, but it is perfectly distinct from all other pears. Its unusually knobby and uneven surface, and the broad distinct brown spots of the skin are peculiar to itself. It is generally in perfection during November and Decem-

of this delicious variety has been already given in seen it 8 or 9 inches long! [I must doubt it.-J. former articles, but at that time too little was L.] Clear red on the sunny side, greenish yellow on known of its merits: subsequent experience has the shady side; excellent towards the carnival [i.e. which fails from the tassels, and there will not be shown that it deserves to be placed at the head of in early spring and keeping till Paques. [i. e. a kernel of grain on the cob. Fecundate or dust all the pears now in cultivation. Numerous specification are carly in April.] It is a great bearer, and it with the pollen of a dozen kinds, and you will mens were received which were ripe in October, rarely fails, but the fruit varies exceedingly in size find all these kinds upon the ripened ear. A field and others which were in perfection at the end of in different years,"

October. [The surface resembles a rough warty

lemon very exactly .- J. L.]

November, but those ripened in less favorable sumcourse keeps longer. It is on this ground that I Paris-figured in the New Duhamel, edited by predicted, that none of the new fruits will keep as Poiteau and Turpin, and in the Jardin Fruitier of long in our climate, as in the more cool countries Noisette. Bose thought the samples sent of the of Europe.—J. L.]

The fruit of the D'Aremberg is strictly turbinate, [like a top or conical] on an average three inches and an half long, and two inches and three-fourths wide, at the broadest part, stalk one inch in length-towards the stalk the figure is slightly contracted. The skin is of a pale delicate green, slightly dotted with russet and becomes occasionally deep yellow at maturity, but it is then past its best. Flesh whitish, firm, very juicy, dissolves in crop even in an unfavorable season. It should be the mouth, wholly destitute of grit-it is sweet, rich, and so peculiarly high flavored, that I know no pear which can be compared with it in that respect.

As this pear possesses merit of such a high de-London Hort. Society, of a new variety of Swan's gree, it is very important that no variety should be confounded with it, and yet I fear this will be found to have happened to a considerable extent .-In the 5th volume of the London Hort. Transactions, among the Flemish pears described by Mr sometimes later. [This pear has never been int- Parmentier, is one called the Gloux Morceaux, ported I believe, but seems to promise well for which is extremely similar to the D'Aremberg, and which I believe has been sent into cultivation under that name. It may, however, be distinguished by its greater size, greater irregularity of outline, its later period of ripening, and though a pear of great excellence, by its firmer, more gritty, and less highly flavored flesh. [Figures are given of both, and the Gloux Morceaux is nearly double the size of the D'Aremberg-the former being four sown in the nursery must have been all taken from inches long and three one-half broad, and the lat- the same parent tree: and this tree must have blos-

This concludes the new pears in the London Hort. Transactions, down to 1827. The only culture de Le Soc. d' Hortic. de Paris, is in the tome premier 3ª livraison, and is called Poire de that of any table pear known. It is as large as a Monsieur. [So called by way of abbreviation of cause a country priest found it, and brought it into

" Poire de Mons'eur. This is a very large an ! beautiful variety, and the following is the account sent to the Society of Paris by a cultivator. It latter are the anthers, which contain the farina, was found in the woods. The original tree is still pollen, or semen, the contact of which with the living. It has been multiplied exceedingly on ac- pistil, or female organ, is essential to the produccount of its excellent properties. Here our peasants still entertain the silly prejudice that you must ber, but this year, 1826, it did not keep beyond graft on the second or third day of the moon, because illustration of the importance and influence of the you must wait as many years for the fruit as the moon had days of age when the graft was inserted !! Beurre d' Arenberg. The history of the origin The fruit is pear shaped, very beautiful. I have female the silk, a fibre of which extends to every

Such was the Country Centleman's accountmers, will keep till February. [I pause here, and but the Hort Society of Paris remark, that M. request readers to examine carefully this sugges. Bose, to whom the pear was referred for examintion. In less favorable summers, the fruit keeps ation, thought it only a St Lezin, a pear cultivated longer in England. So it is here, in cold sum-for time immemorial, in Anjou, and introduced mers, the fruit is gathered less mature, and of within forty or fifty years into the gardens near pretended, or supposed new pear, more colored and more brantiful, but Noisette and Poiteau both agreed with him that it was the St Lezin. Further, the grafts of the new pear have since borne in Paris, and the Society are confirmed in the opinion that it is an old fruit.

[I beg readers to examine this case, and they will be convinced that it is very foolish to be hasty in giving new names, and calling fruits native or natural ones, till they have been thoroughly compared with every old variety.

We hope some gentleman will import from Paris, both the Poire de Monsieur and the St Lezin. They are both new to us, and merit cultivation for their beauty and long keeping.

The promise made to the public has been fulfilled, and I hope advantage will be derived from J. LOWELL.

FOR THE NEW ENGLAND PARMER.

FRUITS, &c.

MR EDITOR-" A Farmer," in your number of March 20, states that his grandfather, seventy years ago, planted out an orchard of natural fruit, from a nursery on his farm, all the trees of which produced uppies exactly of the same kind; and be asks for the cause of this novel circumstance.

There is one, and only one, philo-ophical way of accounting for it, that I know of: The seeds somed in an isolated situation. remote from any other blossoming tree of the apple kind. An apple, pear, peach, or plum seed, grown remote from any tree of its species, will produce fruit like the parent tree, and of no other kind.

Plants, like animals, have sexual organs, necessary and destined to propagate their species. In the fruits above named, and in most other plants, the male and female organs exist in the same flower, or on the same plant. The female (the pistil) is in the centre of the blossom, surrounded by the male (stamens.) Upon the points of the tion of seed. These organs are conspicuous in the common lily of the meadow; and a familiar pollen on the progeny, may be cited in the maize. In this grain the male organs are the tassels, the kernel on the cob. Cover this silk so as to prevent the contact of the pollen, or yellow dust of maize, planted with one variety of seed, pro-

duces its kind pure; planted with a plurality of till March. Among the best varieties of its season, kinds, it will be strangely intermixed in the product. So with the apple; only the pollen of this has been grown. is more subtle, and is conveyed from one flower to another, and from one tree to another, on the wings and bodies of insects which are constantly roaming in pursuit of food. A seed can have but licious .- Loudon. one mother, but it may have twenty fathers. Hence the care necessary in raising pure garden seeds, to keep each variety of a species separate and remote. And hence the cause that double flowers, called by naturalists monsters, so seldom produce seeds: the male frequently, and often the female organs, are converted into petals, or flower leaves, and cease to perform their natural functions.

This beautiful economy in the vegetable kingdoin excited the observation and admiration of Linnæus, was the theme of Darwin's song, and has been rendered subservient to our control, to our comfort, and luxury, by the indefatigable Knight, and other horticulturists of Europe. This last named gentleman was the first to give repeated demonstrations of the correctness of the theory, by practical results; and his example has been followed by horticulturists, florists, and seedsmen.

We are indebted to the labors of Mr Knight, in artificially crossing two known varieties, for some of the choicest productions of the garden and orchard. And that your readers may avail themselves of an early opportunity of profiting by his useful labors, I subjoin a brief description of several varieties, thus artificially produced, now growing in my grounds.

similar in color to a very fine Golden Pippin .-Ripens in Oct., and keeps till February. From a seed of the Orange Pippin, fertilized by the pollen of the Golden Pippin. The specific gravity of its juice 1079, the same as that of the famous Styre cider apple. Obtained the premium in 1802.

- 2. Downton Pippin. One of the most valuable apples for the table and press, Mr Knight remarks, that has yet existed. I do not know any apple, says Salisbury, which can be brought to the market at any given price, with so much advantage to the cultivator. The tree is healthy, bardy, and handsome. Its fruit, in form, color, and flavor, resembles the Golden Pippin-ripens in Nov. and keeps till March. Sp. gravity 1080. Obtained the premium in 1804.
- 3. Yellow Siberian. From a seed of the Loan Pearmain and the farina of the Siberian Crab. Considered very valuable for cider, the specific gravity of the must being 1085 (water being 1000.) The tree is hardy, and said to be a great bearer. Exhibited in 1805, and obtained the premium.
- 4. Siberian Harvey. From the seed of the Siberian crab and the farina of the Golden Harvey. The juice of this apple is the heaviest known, being stated by Salisbury at 1091. Ripens the middle of October.
- 5. Faxley apple. From the same parents as the preceding. A healthy, handsome tree, and when loaded with fruit, which it bears most exuberantly, is on the authority of Mr Knight, singularly rich and beautiful. Sp. gr. 1080. This and the preceding are considered superior for the press, by Mr Knight, to any apple that has been hitherto cultivated. They were both exhibited first, and obtained premiums, in 1807.

and considered one of the handsomest fruits which

7. Elton Cherry, from the Groffian and White Heart. Tree luxuriant, and a good bearerhardy. Fruit large, soft, sweet, juicy, and de-

8. Black Eagle Cherry, From the Groffian and Mayduke. Tree luxuriant, hardy, and a good jury, by immersion in spirits of wine, or boiling bearer. Fruit dark red, firm, sweet, high flavored, and ripens in July .- Ib.

9. Waterloo Cherry, from the Groffian and Mayduke. Fruit deep red, large, conical, firm, sweet, and high flavored. Ripens in July .- Ib.

10. Downton Strawberry. I have grown this fruit two years that measured 43 inches in cir- ing. cumference.

us to need a description.

It may not be improper to remark, that the weight of the juice of an apple, newly expressed, indicates its richness in saccharine matter, and its subsequent strength after fermentation: the heaviest must producing the strongest liquor.

Albany, April 6.

The Bezy Vaet pear, mentioned by Mr Lowell, plan. in our paper of April 23, page 290 of the current volume, was received by Mr Buel, of Albany, we understand, from the London Horticultural Society, in the spring of 1825, and has been extensively propagated in his nursery. The same gentleman has all the others noted in that article, from the same source, except the Tillington. Orders 1. Grange apple. A fruit of great beauty, and for any trees from Mr Buel's nursery will be received at the N. E. Farmer office .- ED.

FOR THE NEW ENGLAND FARMER.

INSECTS.

Mr Fessenden-I perceive that your correspondents are occasionally sending you specimens of insects, and that apologies are frequently made for their bad state of preservation. Would it not be well to publish a few observations on the mode of preserving insects? The season for their reappearance is about commencing, and a little care and attention may so preserve these tormentors and benefactors of man, that the distinguished naturalist, to whom you so often successfully apply, will be able to investigate them with less difficulty and with greater satisfaction. Allow me here to express my earnest wish that Dr Harris will soon resume his "Contributions to Entomology," and that you will be able to find room for his interesting remarks, and for his descriptions of new species.

The following observations, or directions, are chiefly selected from the Introduction to Entomology, by Messrs Kirby & Spence.

Several kinds of instruments are described as useful to the collectors of insects. A strong knife to raise the bark or penetrate the wood of treesa stick to beat the branches, in order to dislodge caterpillars, &c .- a bag-net, of gauze, muslin, or fine canvas, to catch flying insects, and a net of a different construction to fish insects out of ponds, &c. But it is not necessary to be provided with certain instruments, either for capturing insects, used to say that a man would never make a natu-

an expert collector of insects, who on occasion cannot fish with his hand, use his hat, or an old letter to beat his game into, or in the absence of boxes, or bottles, contrive to secure his captives in small pieces of paper twisted up.

As to the most effectual mode of destroying insects, when caught,-hard ones, such as Coleoptera, Hemiptera, &c., may be destroyed without inwater. The immersion in spirits of wine is the best method, because it not only effectually kills the insects, and they may be put together into it while you are collecting, without danger of their devouring each other, but you may let your insects remain in it without injury till the next morn-

When you wish to take the insects you have 11. Knight's peas are too well known among immersed in spirits out of the phial, you must strain its contents through a piece of muslin, return the spirit into it for future use, and spread the insects separately upon blotting paper, to absorb the moisture remaining about them. If you have any in boxes or phials without spirit, these must be immersed in a basin of boiling water; or you may immerse the phial itself, with the cork in, which soon destroys them, and is the safest

> With respect to Lepidoplera, (butterflies and moths,) it is necessary to disable them immediately after their capture. To effect this, give their breasts a strong pinch with your finger and thumb. below the wings. But though nipping the breast will kill many small Lepidoptera, the larger ones will live long after it; as will likewise many Neuroptera, (Dragon flies, &c.) Hymenoptera, (wasps, bees, &c.) and Diptera, (flies, &c.); and besides this, in some moths, the thorax presents a very conspicuous and interesting character, which renders it desirable, in order to avoid the damage or de angement occasioned by pressure, to transfix them without it. There is a simple mode of doing this, the apparatus for which may be found everywhere. Fix a piece or two of elder, willow, or any soft wood, with the bark on, across the bottom of a mug, and on this stick your impaled insects; invert the mug in a deep basin, into which pour boiling water till it is covered, holding it down with a knife, that the expansion of the included air may not overturn it. In two minutes, or less, all the insects will be found quite dead, and not at all wet. Butterflies, moths, and some other insects must not be allowed to get wet, for it essentially injures them. Professor Peck, who used to put minute insects into the hollow of a quill stopped with a piece of wood made to fit, killed them instantaneously by holding it over the flame of a candle.

Insects may be killed by exposing them in a tin box with a little camphor in it to the heat of a fire, which treatment will greatly add to their preservation.

Having killed your insects, your next object should be to prepare them for your cabinet-or if you have no cabinet, you may put them after they are thoroughly dried, in a tight wooden box-and if the pins are thrust firmly into the bottom, they may be transported any distance without injury.

With respect to Coleoptera, and Hemiptera, the pin should be stuck through the middle of the or for bringing them safe home. Dr Franklin right hand wing-case, and about one-third of its whole length should emerge above the insect .ral philosopher, who, in performing his experi- Some insects are so minute that a pin cannot be 6. Yellow Ingestrie. Similar in color and flavor ments, would not saw with a gimblet or bore with put through without injury. For such, the best to the Golden Pippin. Ripens in Oct., and keeps a saw; and so we may say, he will never make mode is to gum them on small triangular pieces of card or stiff paper, which may be stuck upon a pin. Other insects may be transfixed through the thorax, or upper side of the trunk.

Having impaled your insects, the next thing to be done is to set them, or display their parts .-The best time for doing this is not till they have begun to stiffen, but before they are become quite stiff. If attempted soon after they are killed, the parts, unless you keep them in the intended position by means of pins or braces, will not retain it: and if after they are become too stiff, they are liable to be broken. Not only should the antennæ (horns) and palpi (feelers) he extended so as to be readily seen; but the legs and often the wings, ought to be placed in their natural position; all of which tends much to the heauty of your specimens, and adapts them for more ready examination.

For setting-hoards you may use cork, or a species of fungus, sometimes called pith-wood: this last will answer a good purpose, if you select such pieces as are soft.

When sufficiently dried, your insects should be transferred from the setting boards, either to their place in your cabinet, or to your store-box.

Caterpillars and other larvæ of insects may be preserved in spirits.

As certain mites, moths, &c. prey upon dead insects, you may wish to know how they may be kept out of your drawers or boxes, or banished when detected there. Camphor is the general remedy recommended. Scatter some roughly powdered over the bottom of your drawers, and be careful to renew it when evaporated. It is necessary, however, sometimes, to bake your specimens in an oven :- the heat must not be so great

The specimens sent you by S. D. of Dorchester, seem to have been injured by moulding. This may be prevented by having them thoroughly dried before they are stored in boxes, and by keeping them from a damp atmosphere. If done in season, mould may be removed by gently brushing with a camel's bair pencil, dipped in spirits of wine.

Peterborough, N. H. April 14.

FOR THE NEW ENGLAND FARMER.

NEGLECTED GRAVE YARDS.

MR EDITOR-I wish to call your attention to the subject of repairing, clearing, and ornamenting the burial grounds of New England. These enclosures are commonly neglected by the sexton, and present to the eurious traveller, an ugly collection of slate slabs, of weeds, and rank or dried grass. A small effort in each sexton or clergyman, would suffice to awaken attention, to bring to the recollection of some, and to the fancy of all, a scene which every village should present, a grove sacred to the dead and to their recollection, to calm religious conversation, and to melancholy musinginclosed with shrubbery, and evergreen, and dignified by the lofty maple, and elm, and oak, and guarded by a living bedge of bawthorn.

Every sexton should procure some oak, elm, and locust seed, and make it a part of his vocation to scatter it for chance growth.

PHILOSOPHY.

SOWING GRASS SEEDS. (By the Editor.)

A diversity of opinion exists relative to the best time for sowing grass seeds. Some prefer the August, says "This is the best senson of the whole preferred.

fall; but the majority of those who have written year for laying down land to grass; and no other on the subject recommend sowing in the spring; and that season, so far as our acquaintance extends, is most generally chosen. European writers direct, even when grass seed is sown on the same ground with winter grain, to sow the grass seed in the spring, and harrow it in. They say that the harrowing will on the whole he of service to the grain, though a few of the plants will be torn up by the process. The Hon. Richard Peters, likewise directed to "harrow your winter grain in the spring, in the direction of the seed furrows, or drills, and be not afraid of disturbing a few plants: manifold produce will remunerate for the destroy-

The Farmer's Assistant says, "Clover may be sown with barley, oats, or spring wheat, when that article is raised; or it may be sown with winter wheat in the fall, if the land be dry, and warmly exposed; or in the spring when it should be lightly harrowed in." The Domestic Encyclopedia asserts that "experienced farmers generally prefer sowing clover with wheat rather than with barley or oats, as in dry seasons the clover frequently overpowers the oats or barley, and if it be sown late in order to obviate this evil, it often fails and the crop is lost for that season. Probably the diversity of opinion respecting the proper time of sowing clover seed may arise from the difference in the nature of the soil on which trials have been made. An experienced agriculturist, (Edward Duffield, Esq. of Philadelphia County) assures Dr Mease that he repeatedly failed in obtaining a crop, when he sowed his clover in autumn, or winter; and be is uniformly successful when he sows in the spring. Ilis soil is a light loam."

On the other hand, an experienced and scientific cultivator whose suggestions on this subject were published in the New England Farmer, vol. vi. p. 238, dated Weston, and signed J. M. G. says "dear bought experience has taught me the inefficacy of sowing grass seed in spring with grain; it was a custom imported with the ancestors of the country from old England, where the cloudy summers, and moist climate will warrant a practice, which under our clear sky, and powerful sun, is altogether unsuitable. I must add that grass sown in the fall imperiously requires to be rolled in the spring as soon as the ground is in fit order; otherwise the small plants, slightly rooted yet, and heaved up by the frost, will suffer much, perhaps total destruction; and truly among the many uses to which the roller may be applied, none, perhaps, would be more valuable than to roll all grass lands in spring. The plants suffer from the wind and from the heat, and this being the case more or less every spring, it must necessarily bring on a premature decay, which the yearly use of the roller at that season, might prevent."

We cannot reconcile these authorities; but it is prohable that both in fall and spring sowing of grass seeds there may be successful and unfavorable results, according to circumstances of soil, season, &c. Fall sown grass seeds are liable to be winter-killed, or destroyed by frost; spring sown grass seeds may perish by drought and heat. from them. No doubt much depends on the qual-But, whenever sown, there will be less danger ity and richness of the soil. The poorer the soil either from frost or drought, if the seed is well the greater the quantity of grass seed. Clover covered with a harrow, and the ground pressed seed of a bright yellow, with a good quantity of on it with a roller.

is admissible for it on strong, wet, or heavy soils. Spring sowings with grain may succeed, and do often, but that they are hazardous, I know from forty years' experience."

There is likewise a great difference of opinion as respects the quantity of seed to be sown when land is laid down to grass. Sir John Sinclair says, "it is a great error, in laying land down to grass, to sow an insufficient quantity of seeds. In general, 12 or 14 lbs. of clover is the usual average allowance. But that quantity it is contended. ought greatly to be increased, and in many cases doubled." The Farmer's Assistant tells us that "the quantity of red clover seed to be sown on the acre is about fourteen pounds, and none but clean seed ought to be sown."

The "Memoirs of the Board of Agriculture of the State of New York," vol. ii. p. 30, in giving an account of the methods of culture adopted by farmers in Rensselaer County, state that " Farmers differ in opinion in regard to the most suitable quantity of seed. S. Germond, H. Worthington. C. Porter, C. R. Colden, and some others say that eight quarts of the mixture of clover and timothy seed should be sown on every acre. And Col. J. Carpenter sows sixteen quarts on an acre. He . says when the grass and clover grow very thick, it will be more tender feed, and more fine hay, and that it will not run out so soon. But J. Phillips, G. Eddy, and many others, consider four quarts as sufficient.

" All agree that the proportions of the mixture of the secds should be governed by the nature of the soil. That in a sandy soil three-fourths of the seed should be clover-in clay loam it should be equal parts, in clay soil but one-fourth clover seed.

"There should be at least a bushel of plaster sown on every acre of clover and grass land of a sandy, gravelly, or loamy soil. Also on all upland natural meadows. Two bushels per acre are much better than one on sandy or gravelly soil."

Payson Williams, Esq. of Fitchburgh, Mass. who received a premium from the Mass. Agr. Society, for the greatest quantity of spring wheat, raised by him in the summer of 1822, in giving a description of the mode of culture by him adopted, says, "the quantity of grass seed, used by me is never less than twelve pounds of clover, and one peck of herd's grass (timothy) to the acre. Here, permit me to observe, that innumerable are the instances in this country, where the farmer fails in his grass crops by not allowing seed enough; and what is worse, the little he does give, with a sparing hand is suffered to take its chance under that pest of agriculture called the bush harrow, which not only drags stones and other loose matters into heaps, but leaves the soil dead and heavy, and does not cover the seed deep enough to strive with our July drought effectually."

We have, however been verbally assured by very correct and scientific agriculturists, that 6 or 7 pounds of clover seed, where the ground is highly manured is amply sufficient, and that by exceeding that quantity, the plants so shade and stifle each other, that there is little substance in the bay made the purple and brown colored seed among it Young's Farmer's Calendar, under the date of (which shows the maturity of the seed) should be

FOR THE NEW ENGLAND FARMER.

TO ALL WHOM IT MAY CONCERN.

which I belong, I come before the public, and shall, without equivocation or reservation, make a statement of facts. I have some enemies, and many of my friends misrepresent the truth. Associations, ridicule and satire, poetry and prose, business, and I am not abused? Too often I am to render my character infamous. I am accused of being the cause of nearly all the pauperism that now exists; and not only of destroying the peace, harmony, and prosperity of familes, rendering pear to be my friends, but abuse me most shame- bird of night, seek obscurity; but unfortunately. them wretched and miserable beyond description, but destroying the human race by thousands. But destroying a man's good name, his property, and dark cloud, and renders him incapable of anything notwithstanding, I am persecuted and charged with the greatest crimes, I am still a friend to truth and mankind. It is true, that, from the puabuse whatever, without reacting with severitydemerits. I never intrude myself on any person; allel. and when I am forced into company, I treat all, both friends and foes, with the utmost impartiality. As to my parentage, I can boast of great antiquity, or from a knowledge of my power and influence, himself in the black catalogue of drunkards, now and my family relations are numerous, some of or from interest, or because I rid the world of a which rank high in the catalogue of fame. But, vast number of uscless beings, who are a plague 35,000 in the New England States. In the comfor the facts-

It is acknowledged, that I possess all the power and influence, with which my enemies have charged me. I am the strongest of the strong. 1 am a Spirit, with which it is dangerous to tamper. I search the inmost recesses of the body, and when I get the possession of the man, I keep aids of physicians, even a long time after the patient shall have relinquished every disposition and desire to abuse me. I change the character of man and bring him low. I cause his hands to shake, and his knees to tremble; his tongue to stammer, and his limbs to refuse their office. I bring his body into a state of incipient corruption while living. I deform beauty, expel reason, drown the memory, destroy the understanding, and convert the man of science into a disgusting idiot. And to complete the climax, I destroy by untimely and shameful death, sometimes directly; but generally by inflicting some painful disease, beginning with tremor in the hands, noises in the head, inflamed eyes, headach, languor, sickness at the stomach, vomiting, dyspepsy, bloated visage, &c., and ending in gout in all its forms, obstinate sores in the extremities, pain and stiffness in the limbs, obstructions in the liver, consumption, dropsy, palsy, or apoplexy :- but in any case, my friends are ever ready to acquit me, and to assign some other cause foreign from the truth.

Now, all this I acknowledge, yea more, yet, I plead innocence. As before observed, I intrude myself on no person; but I am forced into company, and abused by those who know me, even by those, who believe me to be a poison to the body, a devil to the soul, and indirectly, a thief to the purse. I have been abused by all orders of men, from the Prince on the Throne to the slave, more or less, Justices, Lawyers, Sheriffs, Farmers, Me-

It is a their refusal, that some other person would obtain truth, that inebriation effectually ruins the human the base reward. Will they sell arsenic to their constitution, alienates the affections of friends, desrity of my nature, I shall never submit to any insane neighbors, for the known purpose of sui-troys the peace and prosperity of families, overwithout panishing the offender, according to his chased at another place? The two cases are par- the neglect and contempt of all, except those im-

The wise of the land, the Law makers, are to themselves, a curse to their families, a misance in society, and a heavy charge to the inhabitants, or some other cause, let them answer for them-

In the nature of things there is no evading my punishment for every abuse, whether great or small. You may as well eclipse the sun by holdit, and cling fast to his vitals, in defiance of all the ing up your hand, or stop the foam of Niagara, as to arrest my power and tendency to disgrace, afflict, and punish offenders; yet, such is the infatuation of my friends, that the Lawyer, and the Clown, the Farmer, and the Beggar, the Physician, and the Tinker, meet on equal terms at dram shops, the sinks of society and pollution .-The truth is plain, they are their own destroyers, both of soul, body, and estate-they commit a lingering suicide, and involve their families in the utmost wretchedness. Hence sottish idleness, painobscenity, infamy, bruises, quarrelling, fighting, hospitals, in work houses, and in prisons, murder, crime "to the chambers" of shameful "death;" suicide, and the gallows, are but the effects of their leaving behind him a name, which his friends own wilful abuses of my power, and "eternity will would wish to forget. unfold the consequences.

> It must not be forgotten, however, in the whirlwind of excitement, that, I am to some in a state of exhaustion and great dehility-after exposure to wet and cold-to the aged, and those who are "ready to perish," a valuable and salutary assistant, affording much relief.

And now, gentlemen, as I punish every offendand number of offences against my dignity and chanics, Physicians, Priests, and People. On all pursued. Should you plunge your hand into boil-their blasphemous lips, performing their midnight

of heaven, whose profession is the most important

Could the inebriate behold himself in the mirfamy, in consequence of his wilful course of in-Retailers of drams from interested motives aptemperance, he would be ashamed, and like the cide, because on refusal, the poison might be pur- whelming them in distressing penury, and invites mersed in crime.

Every tippler has entered the broad road to incareful to impose on me, only a small tax-wheth- famy and unlamented death, and has enrolled amounting to more (according to estimation) than monwealth of steady habits, Massachusetts, there are 3,500 paupers, reduced by inebriation, and supported at the annual expense of 180,000 dol-

> Honest men sometimes fail by unforeseen losses and misfortunes, and rise again; but the man who fails in consequence of tippling, fulls to rise no more. When a man is frequently seen at the dram shop, it is high time for his creditors to call for their money.

As intemperance is contagious and easily acquired; and as it unhinges the mind and unfits the man for every purpose, for which he was made-shun every infected place-shun the "appearance of evil." Every appearance of intoxication in a man is sufficient to stamp him with suspicion. What trust can be placed in that man, who has no regard for his own character? The ful disease, loss of reputation, lying, fraud, theft, inebriate forfeits all confidence; alienates his place in society, and in the scale of beings, sinks swearing, debt, rags for clothing, premature old into disgrace, becomes a corrupter of youth, a age, stupidity, disgusting idiocy, confinement in teacher of wickedness, and follows the path of

If what has been said will not convince you, look for a moment, into that temple of corruption, the tippling house, where crime is taught in "terrible perfection;" and where the atmosphere is charged with vapors, as black, and offensive, as those ascending from Vulcan's furnace :- There you may see men, once of reputation and affluence, now sunk into the depths of depravity and er by laws, which are established by the reason poverty, drinking deadly libations, worshipping at and nature of things, according to the magnitude the altar of their idol-a consuming god :- There you may see a motley group of beings, in the power, you will do well to adopt this motto: shape of men, with reddened eyes, clothed with abuse not, "touch not, taste not." There is no com- rags, enveloped in filth, calling upon Bacchus in pounding in this case -no middle course to be broken accents, with nicotianic slaver blackening

orgies! But I forhear-the picture is too appalling-I turn from it with abhorrence.

To conclude -you all know me, and know the consequences of transgression; and you know that I punish for every abuse-therefore be wise, and observe the motto: abuse not, " touch not, taste not." To pursue the thorny way of intemperance is the smooth path of temperance is virtue, wealth, health, and life-pursue it, and victory is yoursa glorious victory over the disordered appetites.

Your obedient servant, SIR RICHARD RUM.

GRAFTING CHERRY TREES.

MR FESSENDEN -- I do not recollect that any person has described in your paper the best mode if any one has a better.

on, as the bark does not split freely, but tears like yellow sweet apple, very early. This produces cloth. In the spring of 1825, I procured many yellowish green apples about the size of the Baldkinds of plnm scions of Capt. Hyde, of Newton, win, ripe in O tober, and gone in November,which I set in March. Scarcely one has failed; This proves that winter apples will not do well on and all kinds have borne except the Canada plum, early summer stocks. I also grafted many cherries, which took and crime, poverty, disease, and death; but, to walk lived well. Last spring I had about nine trees, headed and grafted. The scions all lived and did ; well, except two trees, the scions for which were cut 4 or 5 days before using. Of these none lived. The scions of cherries, like twigs for budding, ought to be cut the day they are used. I have the Tartareans, Oxhearts, &c. growing on wild cherries, both the black and red stocks.

My method of grafting is this. Take clay, prepared as for all other kinds of grafting. Then proceed in the same manner as in other cleft graft-MR J. B. Russell-When I made you the com- ing on the heads or stocks of cherry trees, using a munication on the subject of hemp, it was my in- wide thin shoe knife; which drive down as far as tention to have inscrted a note, giving an extract it is intended that the scion shall go. This cuts of a letter which I received in 1824, testing the the bark smooth. The clay must be bound on with rags or tow, or it will become wet, freeze, crack, and crumble off, and then death is the portion of the scion. The knife must be wide, thin, and sharp for grafting plum or cherry trees; and the clay kept bound on tight and snug. This being done, and done in season, scions are as sure on eherry trees as on the apple tree.

Last spring I grafted my cherry trees the 15th of March. Then it was so cool I had to warm the clay in a kettle over the fire, and use a furnace to warm water over. I related the above manner of grafting to Capt. Francis A. Pickering. grafting the small, low, wild, sour, red cherries .-He told me afterwards that they lived as well as apple scions. Wild cherry tree stocks should be grafted at the ground.

I have peaches, apricots, and mulberries, grafted on plum stocks. I had pears growing on the hazle, or hop hornbine tree, but by misfortune, is advertised to be held on the 14th of Oct. 1829, they were destroyed. I intend bringing some The premiums proposed are liberal, and embrace scions I have never seen advertised, viz. The a great many objects. Among others are \$10 for Warren apple is a large, juicy, good apple, and I the greatest crop of Millet: \$5 for do of Sugar trust but little known to any distance. It is the Beets; \$12 to the person who shall make the most prolific apple here, bears well on poor soils, most satisfactory experiment to ascertain the best and bears yearly. It is a large, green, flat, juicy mode of raising Indian Corn, in hills, in rows, or apple, and keeps till January. It has a branchy in ridges: \$20 to any person who shall introduce top, and must not be grafted at the ground. The any Grass, not before cultivated in the State, and Mackay Sweeting is of all the largest sweet apple prove its superiority to any other grass now cultifor winter, nearly twice as large as the Baldwin, vated; \$10 to the person who shall prove by exand of an orange color. The Manumoth Spice is periment the best season and modes of laying This difference would allow a deduction of full larger than the Robust Greening, a good bearer, down lands to grass, whether spring, summer, or and a good bearer. BOSTON, FRIDAY, APRIL 17, 1829.

Aid to Agriculture in Connecticut solicited .- The Hartford County Agricultural Society have determined to present a Memorial to the Legi-lature of Connecticut, requesting such an appropriation of money from the State Treasury, as may be competent to the successful encouragement of Agriculture and the Domestic Arts; and have proposed a bill that an annual appropriation of money, not exceeding twenty-five hundred dollars, be made for that purpose to be awarded in premiums, &c.

Loss of Sheep in Nantucket .- The Nantucket Inquirer gives it as the opinion of many that the severity of the past winter, had caused the death of one-fourth part of the sheep owned upon that island; and that those which perished during and since the storm of the 22nd of March, exceeded in number all that had died in the course of the winter. And adds, "we have been informed by a gentleman of strict veracity, and who was an eye witness to the distressing spectacle, that many of the sheep were driven by the tremendous force of the storm to the southern part of the island, and there remained boried in large numbers in the snow, many of them with their beads out, and the crows actually pecking their eyes out before they were dead!"

Cattle Show at Pawtuxer, R. I .- This exhibition ment of bees; \$5 to any person who may within Much can be done in beautifying the colors of the present season have raised on one piece of

The Climate of the Middle States compared with

Silk and Silk Worms .- The Pennsylvania Society for the Promotion of the Culture of Mulberry Trees, and the raising of Silk Worms, have sent to France for an experienced workman, to teach the mode of winding silk from cocoons, &c. and state that they have reason to believe that one will arrive in time for attending to this business in the course of this year. They state that a fund will be established for the purchase of cocoons, at such prices as will enable the Society to continue their efforts, without encroaching on the small capital which they have at command. They regret that this will not permit them to buy at a price amounting to a bounty, but they will give the just value of the several qualilies which may be offered for sale. Cocoons differ greatly in quality, owing to the nature of the food on which the worms are fed, and to the great care taken of them during their short existence. The Society beg leave to refer for ample instructions as to their management, to the pamphlet which they published last year, which may be had of Carey, Lea & Carey, corner of Fourth and Chesnut streets, and also of E. Littell, No. 136 Chesnut street. This pamphlet has been republished in the current volume of the New England Farmer, commencing page 44.

Preservation of Melons, &c. from Bugs .- The following was published in our paper in September, but may be new to some of our readers; and may have slipped the memory of others, who have before read it.

MR FESSENDEN-I have found it almost impossible to raise melons on my grounds, and I was much pleased to learn last week, from a person jar, and keep it close covered for use. When in Northampton, that "melon seed soaked 24 you use it, spread a little of it on the furniture hours in a decoction of tobacco, will be effectually protected from bugs." My informant has so prepared seed for many years, and assured me varnish .- Mcch. Mag. that it was a complete prevention. A. M. T.

BEST TIME FOR DESTROYING CATER. PILLARS.

MR EDITOR-The season for the appearance of the caterpillar, so unsightly, and, unmolested, so injurious to fruit trees, reminds me of the best time for their destruction. By experience I have found them uniformly in their nests at mid-day, when the sun shines clear and warm, until more than half grown. At this time they may be rolled in their nest with ease, as far as they can be reached by the aid of a ladder, or otherwise, and cast to the ground, where they are easily destroy-This may be generally known; if so, no harm is done, otherwise you will give it such notice as you may think proper.

ONE OF YOUR SUBSCRIBERS. April 1829.

A permanent buff or nankeen dye for muslin, linen, cotton, and, probably silk or woollen, from Horse Chesnuts .- For the buff color, take the whole fruit, husk and all, when quite young (perhaps about as large as a small cherry;) cut it small, and put it into cold soft water, with as much soap as will just cloud or discolor the water. When deep enough, pour off the clear part, and dip whatever ronage. It is a very near volume of 250 pagesis to be dyed, till it is the color required.

in soft water, with soap as above, and dye in the on copper, of the various public buildings of the same manner. The husks may be used for the city. These sketches are executed with uncombuff dye, after the kernels are formed; but it is only when they are almost imperceptible that the whole fruit is used, and the brightness of the buff Boston. color diminishes as the husk ripens, till, when quite ripe, the dye is most like nankeen.

It is thought that this, which was discovered by accident many years ago, is not generally known; and that being a permanent, cheap, and easily er periodicals-Charitable, Literary, and other soprocured dye, it may be useful, and supersede, in cieties-Public Buildings, Bridges, and Hospitals some measure, foreign dyeing stuff. The soap -its Trade and Commerce-its Islands, and the used was white or brown Windsor, and common towns in the vicinity-Places of amusement-Remottled, whichever was at hand. Hot water cent and projected Improvements-its Hotels-a seemed not to answer so well as cold in making list of Stages and Post Coaches-with many oththe dye, as it was less bright; but once dyed, er subjects of general interest, both to the resident nothing ever was found to efface the color. A and traveller-and concludes with a copious Indyer would easily find the proportions, and, per- dex. haps, some alkali instead of that of the soap. But if tried at all, it is particularly requested that the for the success of a work not unworthy of being directions here given may be strictly followed at ranked with the more expensive European compifirst, as they are exactly given by the person who lations of a similar description.—Stat. is thought to have made the discovery. Muslin, linen, cambric muslin, and calico, were tried; it did not discharge the colors of printed cottons.

The husks may be gathered during September and most of October. Whether any use can be made of them when dry, or whether the dye can be made and kept till the young chesnuts are ready, has not been ascertained .- Mech. Mag.

German Polish for Furniture .- Melt an ounce of black rosin, and a quarter of a pound of yellow wax in an earthen pipkin, and pour in by degrees, two ounces of spirits of turpentine: when the whole is well incorporated, put it in an earthen with a woollen cloth, and rub it well in. In a few days the polish will be as hard and bright as

London Yeast .- The yeast which is employed in London is obtained from the brewers, and hence is often tainted with the hop mixture. In other parts, such, for example, as Edinburgh, the bakers make use of an artificial yeast, prepared in the following manner, which is quite free from any such taint, and answers the purpose of fermentation equally well. To 10 lbs. of flour they add two gallons of boiling water; they stir it well into a paste; they let this mixture stand for seven hours, and then add about a quart of yeast. In about six or eight hours, this mixture, if kept in a warm place, ferments, and produces as much yeast as will bake an hundred and twenty quartern loaves .- Ib.

Secret in buying .- Buy in winter and sell in summer whatever is bought and sold by liquid measure. Thirty-two gallons of spirits, bought in winter, will, without being in the least diluted, make thirty-three in summer. The reason is that all hodies, fluids especially, expand with heat and contract with cold.

Bowen's Picture of Boston .- This elegant and very useful publication has been recently so highly extolled in the city journals, that it can be bardly necessary for us to recommend it to public patand contains a Map of Boston with the latest im-For the nankeen color, take the husks of the provements-another Map of Boston and its envifruit only; cut or break them small; steep them rons-and about thirty-two engravings, principally

mon neatness and accuracy, and comprise among them views of sixteen of the principal Churches in

The work commences with an Introductory History of the City-and then proceeds to give a concise account of its municipal government-its Schools-Public Libraries-Newspapers, and oth-

MISCELLANIES.

Marriage .- There is an excellent book by Defoe, the author of "Robinson Crusoe," called "The Complete English Tradesman;" and in it, an admirable chapter, entitled "Of the Tradesman's marrying too soon." In this he says "It was a prudent provision which our aucestors made in the indentures of tradesmen's apprentices, that they should not contract matrimony during their apprenticeship. Doubtless our forefathers were better acquainted with the advantages of frugality than we are. Hence we find them very careful to prescribe to their youth such rules and methods of frugality and good husbandry, as they thought would best conduce to their prosperity .-Among these rules, this was one of the chief, viz : 'that they should not wed, before they had sped.'" When a young tradesman, says the same author, in Holland or Germany, goes a courting, the first question the young woman asks of him is, " Are you able to pay the charges?" That is to say, in English, are you able to keep a wife when you have got her? What a world of misery it would prevent if the young women in all countries would stick to the wisdom of that question! "Marriage is not made of mushrooms, but of good round cakes," is another of the pithy sayings by which our ancestors conveyed the same great rule of pru-

Talkative Laborers .- And, let me here step aside for a moment to observe, that a mau can hardly have a worse quality than that of being talkative while at work; or as the country people call it, mouthy, which is the proper word to designate the quality. A man may be strong; he may be willing; he may be handy; but if he be mouthy, he is a disturber of the peace of the farm house, and you never can employ him with other men. His sonorous voice is sure to make all the rest prick up their ears: they talk too, if not in the way of emulation, in the way of reply or observation; and if you let them alone, you have a colloquial assembly rivalling in their way the Catholic association in Ireland. Up go the backs of them all: not that they want to rest themselves, or to slight your work; but they want to reply or observe upon the interesting points mooted by the orator. I know a gentleman who says that there is but one thing worse than writing, and that is talking. On a farm, I would certainly prefer a writer to a talker; for then he would include his propensity at times when it would be no detriment to me. - Cobbett.

Rail Roads .- A second edition of Jackson's Lecture on Rail Roads, was published a few days since, by Mr Henry Bowen, and we understand that the whole edition of 4,000 copies is nearly exhausted. This edition is in a small neat form, and afforded at a very moderate price. friends of internal improvement in the city, could in no way probably advance the project of the contemplated rail roads in this Commonwealth, so cheaply and effectually, as by giving a general circulation to this pamphlet. It embodies a mass of facts and experiments, incontestible and convincing; and throws much light on a subject, which is, hereufter, to occupy no small share of the public attention. Booksellers in the country and the friends of rail roads, generally, would do well to been made very sick by eating partridges; which send in their orders immediately,

The sufferings of the reputable poor .- At the meeting on Saturday afternoon, the following interesting cases were most respectably vouched.

A woman of very tender frame, and whose modest countenance wore the mark of extreme suffering, was seen to steal a moment, when she supposed the eye of her Creator alone was near her, to pick up and greedily devour some boiled potatoes, which had been thrown into the street, with the slops of a kitchen. Her feelings would not allow her to beg, but starvation drove her to purloin from the dogs.

A respectable washerwoman, voluntarily confessed to one of her employers that she had been driven by cold and hunger, to the terrible resort of pawning a part of the clothing entrusted to ber.

A lady went to visit an old acquaintance, and with some difficulty was admitted into the house. The friend, who with her in her youth, had enjoyed every affluence, was wrapped in a thin coverlet, surrounded by three little children begging their mother for something to eat. There had heen no fire in the house for four days, and they had not a particle of food-the children blue with the cold, and the mother too weak to walk.

Another case was mentioned, of not so recent existence, where a father was helpless, his wife sick, one child dead, and another dying, without food, or clothing, save a few tattered rags, and some straw .- Penn. Gaz.

Prognostics of the Weather .- Red clouds in the west, at sunset, especially when they have a tint of purple, portend fine weather. The reason of which is, that the air when dry, refracts more red or heat-making rays; and as dry air is not perfeetly transparent, they are again reflected in the horizon. A copper or yellow sunset generally foretels rain; but as an indication of wet weather approaching, nothing is more certain than the halo round the moon, which is produced by the precipitated water; and the larger the circle the nearer the clouds, and consequently the more ready to fall. The old proverb is often correct:

A rainbow in the morning is the shepherd's warning : A rainbow at night is the shepherd's delight.

A rainbow can only occur when the clouds, containing or depositing the rain, are opposite to the sun; and in the evening the rainbow is in the east, and in the morning in the west; and as our heavy rains in this climate are usually brought by the westerly wind, a rainbow in the west indicates that the bad weather is on the road, by the wind to us, whereas the rainbow in the east, proves that the rain in these clouds is passing from us. When the swallows fly high, fine weather is to be expected or continued; but when they fly low and close to the ground, rain is almost sure approaching. This is explained as follows: Swallows pursue the flies and gnats, and flies and gnats usually delight in warm strata of air; and as warm air is lighter, and usually moister, than cold air, when the warm strata of our air are high, there is less chance of moisture being thrown down from them by the mixture with cold air; but when the warm and moist air is close to the surface, it is almost certain that, as the cold air flows down into it, a deposition of water will take place-Edin. New Phil. Journ.

A gentleman in New York and his family have are found often poisonous at this season of the year. at the Agricultural Warchouse No. 52 North Market Street.

Fruit Trees, Grape Vines, &c.

ANDREW PARMENTIER, Proprietor of the Horficultural and Botanical Garden, Brooklyn, New York, at the junction of Flatbush and Jamaica Turnpike, two miles from the ferries, offers 12 of the most select Table Grapes, very hardy, of the north of France, at \$6 the dozen, with directions for planting, &c, or at 75 cents a piece, separately-such as they are described in his catalogue. He also offers for sale Vines at 25 cents each, for vineyards, warranted to grow. They can be had from the 15th Ocwarranted to grow. They can be had from the 15th March to tober to the 15th December, and from the 15th March to the 15th May—a great many have borne fruit this summer. He has a choice assortment of 242 kinds of apples, 190 kinds of superior pears, 71 cherries, 64 peaches, 15 nectarines, 85 plums, 18 apricots, 20 gooseberries, &c, some of very large size and in a fine bearing state. Also, apple trees paradise stock, full of fruit. His collection of ornamental and forest trees, and of ornamental shrubs, is of 336 kinds, and more than 200 rose plants, and a fine collection of green house plants.

A. P. will undertake to lay out pleasure grounds and gardens, and will be happy in showing his port folio to amateurs, at his establishment of nurseries, which consists of 24 acres. Orders should be directed to A. Parmenter, at his establishment, or to Mr John B. Russell, New England Farmer Seed Store, No. 52 North Market Street, Boston, where catalogues may be had gratis,—and of his other agents, in different cities in the Union.

Fruit Trees.

Messrs WINSHIPS respectfully request those of the public who may incline to favor them with their orders the ensuing season, for froit and ornamental trees, fancy shrubbery, herbaceous plants, whether indigenous or ex-

otic, to forward their orders immediately, and they will be executed with every possible despatch. They also have several hundred genuine Isabella Grape Vines, by the hundred or single plant, with the superior European kinds in cultivation in this country. Letters directed to F. & I. Winship, Brighton.

P. S. Asparagus roots from one to four years old. England Farmer Seed Store, 52 North Market street, will be executed at the Nursery prices, and the trees delivered in Boston, free of expense for transportation.

Brighton, March 11, 1829.

FOR THE NEW ENGLAND FARMER.

FINE NATIVE PEAR.

Epargne Pear, in the vicinity of Boston, is by most persons considered a native; the tree having thorns is thought to be further proof. This pear is one of our finest summer fruits, and is much cultivated by a few of our best farmers. It will not keep long, decaying sometimes soon at the core; size and form like a middling sized Jargonelle, neck not quite so long, flesh rises a little on one side of the stem-color dark green, covered with some russet: a brown blush on the sunny side; as it rivers turns yellow, flesh whitish, very melting and juicy, flavor between our Jargonelle and Sectle. A great favorite with the marketmen, sells high; a great and constant bearer where the tree has age-scions will not bear for five, six, and seven years, then increase with their age. The character of the tree is strongly marked. You may know it at a great distance; makes very vigorous wood, tolerably firm, branches grow strong and very upright, resembling the Lombardy Poplar more than any other tree-blossom large, and open-comes in eating the first of Septem-

Among others, I have myself doubted if this fine fruit was a native variety. I have lately visited the farm of Mr Goodard, in Old Cambridge, and examined the trees. Mrs Goddard stated, she had eaten fruit from the old tree in the passuckers from it have sprung up, and shoots from the first suckers are now growing and bearing the same fruit as the old tree. Mrs G. also said, the pears increased in size and quality every generation, (this is probably owing to their being placed in richer land.) I cut fine, fair, and large scions from a sucker ten feet high, growing under the last generation, (probably will bear this season) have compared them with the parent tree, and find no difference in the wood. This evidence I think so conclusive, as to leave no doubt with me, in its right to be ranked a native fruit. Mrs G. inthem being told by a gentleman who had eaten fruit resembled them, they immediately adopted market, and abroad, as the Boston Epargne .-As this appellation appears to be established, probably it is a good name for it, but our country must claim the credit of producing this superior pear.

FRUITS, &c.

Editor of the New Eugland Farmer.]

A description in the New England Farmer, of able.

a number of newly originated varieties of apples, the efforts made to save the lambs disowned by varying in their time of ripening, would confer a the dams. Yeaning is nearly completed, and alfavor by giving a short description of them, in the though there is a less proportion of hard udders Farmer. It is the opinion of many persons here, for some days past, there is lack of nourishment and particularly further up the Susquehanna, that for the lambs, and a great proportion die. orchards of natural fruit, last much longer than where grafted trees are planted. But it appears in the same way as mine. No man has teld me to me that if a good variety of newly originated his flock, fed on hay, is in usual good condition .kinds, such as to keep up a succession in ripen- Almost the only flock which has done well on ing could be procured, that grafted trees of such yeaning, to my knowledge, has been kept on a kinds would be found to make as lasting orchards gill of corn to each daily, and so much clover that as when the seedlings or natural fruit is planted. the stalks have been left. A near neighbor with The date of the origin of many of the best kinds a small flock has improved it of late by a quart of of apples now cultivated is not known-and in the potatoes to each sheep, and so much clover that orchard they may fail from the age of the variety being great-and I think it is high time attention was paid, by those capable, to provide a succession from new kinds.

What is meant by boiling pears or apples?

What is the most proper and easiest manner to proceed in planting an orchard, after the triangle, diamond, or quincunx form-and what number of hands, or what help does it require?

Your friend.

· York County, Pa, April, 1829. FOR THE NEW ENGLAND FARMER.

DISEASED SHEEP AND LAMBS.

Ma Fessenben-Your correspondents, Messra Reynolds, and B. will please accept my thanks for their communications in your paper of the 3d ture sixty-five years since, which is now dead; inst. I must beg leave, however, to differ in opinion from them, in regard to the cause of the malady which affects, not only my own flock, but a great proportion of the flocks in this region.

The hay salted when put in the barn, was all expended before yearing commenced. While fed on that, my sheep were in good condition. The man who assisted in dividing the flock into the several vards, at the commencement of winter, having occasion to handle a part of the flock some of the last days of January, observed, the sheep were as heavy, and in as good condition, as when driven to the barn. There is little doubt but too formed me it was called the Sugar pear. Differ- much salt may be forced on animals; but these ent marketmen have presented them in our mar- sheep licked it, when offered them, when fed on ket for twenty years, calling them by names most the salted hay. Two years ago, my flock was likely to produce a good sale for them. One of kept, on experiment, through the winter on 1 lb. of hay and a gill of corn to each sheep daily-they the fine Epargne pear of France, that the above came out in good order, with heavy and tight fleeces. Every lamb was reared. Soon after my this name, and it is now only known by it in our salted hay was gone, many of the sheep began to grow poor and feeble; too large a number of the older ones died; several of the lambs, yeaned last, may, and some in the prime of life. Dissection ping from the mouth of one about S weeks old. showed, that death was caused by what, we farmers, call drying up of the manifolds; it will amount to dyspepsy in the human subject. Having become satisfied that a change of food was absolutely necessary to preserve the lives of the flock, and not having a supply of succulent food; the next [Extract of a Letter from York County, Pennsylvania, to the best substitute, in my opinion, was Indian corn. About one-half the full allowance of hay was disthe newly originated varieties of pears, as you be- been given to each sheep daily, with occasionally vine, which had been set out four years, and was

And Mr Buell, or any other gentleman who has thaving grown feeble since. No success attended

Nearly all the flocks in this region are affected the stalks are refused. Those who have fed most on other food than hay, so far as my inquiries have extended, have had the best success. Although there are some few, who have escaped hard udders with hay, but have poor and feeble sheep with great loss of lambs, and more or less sheep. The young cattle in this region are many of them affected with the hair falling off from various parts of the body, about the head have appeared warty excrescences, and eruptions similar to the ring worm on the human body, and are to be seen in a great part of the farm yards. The stock, though bountifully fed, is not in the usual good condition, at this season of the year.

The above are facts which have been learned by sad experience, and the most diligent inquiries in my power to make. They are offered for publication as well to receive as to give information. If among your numerous correspondents, any one is able to assign a better reason, than the one offered by mc, that the malady is occasioned by the unwholesomeness of the hay grown and cut in a very wet season, and in great abundance, the public as well as myself will be benefited by receiv-

The proximate cause of all this evil is derangement in the digestive organs : whatever may be JOHN BARSTOW. the exciting one.

Anson, 7th April, 1829.

P. S. April 8th-1 have this morning examined a small flock of native and mixed sheep. The owner says his bay was all secured in good weather, yet there was but one day that any gum was found on the scythe. The sheep were full fed on the hay alone, until they grew so poor that extra food was necessary to preserve their lives. More than half his lambs are dead. Several udders are in a state of ulceration, with small pustules, not unlike the chicken pox. Several of the lambs have very sore-mouths, and the blood was drop-

INDIA RUBBER USEFUL IN PRUNING AND GRAFTING.

MR Fessender-The following fact, discovered by me, may not, perhaps, be uscless to agcontinued, and for nearly four weeks 11 gills have riculture. Last year I cut off a native grape come acquainted with them would be accept- a mess of potatoes. Since this change in diet, the vigorous, in several places, on the first ascending sheep have evidently improved, but one or two of the sap, about the first of May. I bound the cut ends over with thin strips of India rubber, and in every case prevented any escape of sap. I imagine this substance to be preferable to any other for binding in buds for grafting, &c.

Yours, &c., BENJAMIN BELL. Charlestown, April 16, 1829.

From the American Parmer.

THE GRAPE VINE.

MR EDITOR-As the season of the vine is now at hand, I think it may be of some use, or at least some interest, to many of your readers, to have a few short rules and observations to direct them in the culture of that valuable and beautiful plant .-These I have extracted from French books, and especially from the "Ecole du Jardin Fruitier," a work of considerable merit, and of great authority in France, where the grape is raised of so fine a quality, and in such abundance. I have added some remarks of my own, or from other sources, when the subject seemed to require them.

AN AMATEUR.

NOMENCLATURE.

Our language is somewhat deficient in definite terms for the various operations performed upon the vine. It will therefore be proper for me, before proceeding further, to establish the meaning of the words I shall have occasion to employ.

The words pruning, lopping, and trimming, are commonly used indifferently to express the same thing and different things. There are various distinct operations to which they may be applied, and are applied; and much confusion is the conseanence.

In the course of this paper, I shall use the term pruning, for that cutting which the vine receives in the fall, after it has shed its leaves, or in the spring, before it has recovered them. Lopping I reject altogether, as meaning a more violent operation than those regularly performed upon the vine. Trimming I shall apply exclusively to the operation, performed several times during the summer, of plucking off the useless or injurious shoots. Thus, pruning will correspond with the French word tailler; and trimming, with ebourge-

PROPAGATION.

Of the modes of propagating the vine I shall say nothing, as they are generally well understood. I will observe, however, that my own experience has convinced me, that a cutting with one bud or eye is as likely to succeed, and will produce at least as fine a plant, as a cutting a foot or eightcen inches long; especially if it be planted in a pot, early in March, and placed in a hot bed until the warm weather. In July it may, with perfect security, be turned out of the pot into the place, in the open ground, where it is to grow. But hot beds and flower pots are not indispensable. It will do as well to plant the cuttings in boxes at the usual time for the open ground, and place them in some situation where they may be sheltered from the excessive heat of the sun. In the fall they can be transplanted to their destined places. One of the advantages of this mode of propagating by enttings is, that an ordinary entting will supply you with ten or twelve plants instead of only one; a consideration of some importance when you have only one cutting of a rare species of grape.

The proper time to prune the vine is in March, earlier or later in the month, according to the state of the weather. To prune too early, is apt to make the buds shoot prematurely, before the frosts to an injurious bleeding, or loss of sap. If you prune in the fall you run the risk, should the winter be severe, of having most of the bearing branches destroyed. In this city and neighborhood, people commonly prune too early in the spring. Most persons have already pruned theirs a week or a formight ago, before the late hard frosts and heavy falls of snow. Mine are not yet pruned, (March 23d,) and may not be if the weather continues unfavorable, for a week or ten days to come.

In pruning, cut half an inch above the bud, to prevent the branch that will sprout from it from being easily blown or broken off. The little stump that remains may be removed the next year .-Also cut slopingly, and on the side opposite to the bud, that the sap which exudes may not run down upon it and injure it.

A vine should be pruned according to its age.

1st year; leave one bud.

2d year; leave two buds.

3d year; leave three buds.

4th year; leave four buds.

5th year, and afterwards; leave five or six

I speak only of those vines that grow in the open vineyard and are staked, and not of those spread on trellises; although most of these rules are applicable to the latter also. But they require other attentions, and deserve a separate notice. 4 In the third year, vine dressers generally leave a short side-shoot to the principal stock, with one bud on it; in the 4th year, a side-shoot with two buds; in the 5th year, one with two or three buds. Indeed, if the vine be of mature age and exceedingly vigorous, they often leave the principal branch from three to five, or six feet long, according to its strength, with all its buds; and, at the same time, a side-shoot a foot long. In some soils and situations, the vine is so vigorous that it would exhaust itself in barren length of limbs, and produce no fruit, if you pruned it to so few buds as those prescribed for ordinary cases; and you must therefore weaken and tame it, as it were, by loading it with fruit. Each one must judge for himself, from observation, when these precantions become necessary. When a vine betrays too much luxuriance, it is often brought into bearing, by leaving five or six of the largest of the last year's branches, one of them five or six feet long, and the others with from one to five or six buds upon each, according to its apparent strength. In those cases, on the contrary, where the vine is feeble, two or three branches, with from four to two buds on each, will be enough.

It is the opinion in France, that the vine should be kept low, in order that its fruit may receive the benefit of the heat reflected from the ground; and that it should be suffered to grow and bear high, only in the hottest climates. In some countries it is trained upon the trees. I have seen it, in the plains of Lombardy, hanging from the elm or the poplar, in festoons from tree to tree, for great distances, covered with loads of fruit. But the trees are there regularly trimmed and topped for fire wood, and therefore give so little shade as not to in that way. You will permit each of these injure the grape.

STAKING AND TYING.

As soon as the vine is pruned, it must be staked with poles of the height which you intend to allow the vine to attain; and the vines must be tied to them. By staking later, after the buds have are over; and to prune too late exposes the plant shooted, you may break off many of the young branches.

TRIMMING.

About the middle of May, or somewhat later, according to the season, it will be necessary to trim your vines.

You will find that they have produced many young branches, and that in some instances several shoots have sprung from a single bud; and you must therefore reduce each vine to that allowance of branches which you had assigned it at the time of pruning, according to its age, or its age and strength both considered. If this be its first year, carefully pluck or pinch off all the shoots but one, leaving that which appears most thriving; if its second year, of all but two; and so on, according to the age and vigor of each.

This operation must not be performed too soon; for, if it be, the vine will throw out a still greater number of suckers or shoots than it had before. It is not difficult to ascertain, by inspection, when the shoets have attained the size at which they may be securely removed. Do not hesitate to remove some that show fruit; for if that fruit were left, it would only diminish the quality, and perhaps even the quantity, of the whole

After trimming, immediately tic the shoots to the stakes.

. Hout the first of June, or somewhat later, according to the season, and to the precocity and vigor of the plant, you must again tie the shoots to the stakes, for they will have grown much longer than when you tied them last; and give them a second trimming, by pinching off such as have started from the axillas of the leaves.

About the first of July, or somewhat earlier or later, according to the circumstances above alluded to, give them a third trimming and tying, taking off all useless shoots. In France, it is usual at the same time to break off the top of the vine, at a joint, about the height of the stake, or espalier, or wall. But many experienced persons think it had better not be done in this country. If done at all, it should be done late; and I may say, generally, of the various trimmings, that they had better be done later than earlier than I have indicated; for vegetation is so luxuriant in this climate, that the vine is much more apt, than in Europe, to push new shoots after being deprived of the first.

It will be necessary, during the whole summer, to remove from time to time, any new shoots that may appear.

TRELLISES.

To prune a vine trained on trellises or espaliers, or walls, you untie and loosen from the trellis all the younger branches, leaving the older and principal branches attached. Then cut off all the dead wood, knots, little stumps, useless twigs, &c. and remove dead leaves, cobwebs, snails, insects' nests, &c. The best way of training a vine, is to stretch out its two principal limbs, like arms, horizontally, to the right and left, about a foot from the ground. This, I will suppose, has been done in former years, and that the vine remains divided arms to advance, every year, from three to six

ed, suppress the failing one entirely, and cut off the principal branch itself, where it affords the next shoot, thereby making the latter the leading one. On each of these principal branches, or arms, retain a row of upward shoots at the distance of about a foot from each other, each of which prune to three, four, or five buds, according to circumstances. Those that are very strong and spring from a vigorous plant, may have a sideshoot also left upon them, and sometimes two, one upon each side, with one or two buds each. All the upward shoots, between these that are to be left at a foot's distance, must be cut off, as also all downward and lateral shoots.

vines as to staked ones.

If the espalier, trellis, or wall, be long and high, and there be several vines planted against it, each must be trained in the manner just prescribed .-But that they may not interfere with one another, they need not be permitted to spread so much .-It will be necessary, also, to give them different degrees of elevation, so that they may be one above another in stories, as it were, and thus each perform its part in covering the trellis.

ORCHARDS.

During the spring months of past years, our fair State has been overrun with a troop of strollers, the lineal descendants of the pedlars of hickory nutmegs and pine pumpkin seeds, with a caravan of fruit tree sprouts, and a cart-load of wax, turpentine, and tallow, professing skill in the mystery of engrafting. When the invaders fastened upon an orchard their ravages have been more injurious than the depredations of all insect enemies of the cultivator. Saw, hatchet, and knife, were busy in the extermination of tree-top and trunk, until the apple groves became as bare of green leaves as if a combined incursion of cankerworms and locusts had wasted their verdure. Then the marauders mounted their long tailed steeds, and disappeared to the Green Mountains, leaving the employer at a loss which to admire most, the extent of their devastations, or the apparent disinterestedness of their operations. On the latter point, all uncertainty was removed when the itinerant pruners reappeared with the closing summer to take the census of sticks, and enter into computation of costs swelling to a pleasant aggregate of time. dollars.

The operation of engrafting, although one of the most curious, is among the simplest operations of art. Slight observation and experience will give to any one who can use a knife and saw sufficient skill to perform the process, with his own hand. By entrusting the safety of the orchard to the itinerants who swarm over the country, the life of the tree is risked, and the value of the productions, if it survive the terrible amputation, endangered. If the leisure or inclination of the farmer do not permit his own practice, it were better to employ those whose skill or fidelity was more known than that of wandering strangers.

Without intending to trespass on the hereditary territories of the sages of the almanac, we would venture to note that the present month is the proper season for the insertion of scions. Experience has shown that the operation may be most suc- of seed sown on an acre of middling land should gus, and said to be little inferior.

From the Hampshire Gazette.

немр.

By the report of the Commissioners of the Navy to Congress, on the subject of Hemp, it appears that experiments have been made to ascertain the quality of American water-rotted hemp, compared with Russian hemp. The American hemp, before spun into yarn, was found the strongest, and after made into cordage and tested on board of ships, its strength and durability were ascertained to be fully equal to cordage made of Russian hemp similarly exposed, and if there is any difference between the best American and the best Russian water-rotted hemp, when brought to our market, the Commissioners unhesitatingly say it is in favor of the former. The Commissioners say, they never have entertained a doubt of American water-rotted hemp being equal to Russian hemp. Cordage made of American dew-rotted hemp, after a year's wear, was found inferior to Russia rope, which had been used the same length of

One reason why American hemp has been esteemed inferior to the Russian arises from the imperfect mode of caring. The gummy or glutinous substance not being sufficiently cleared away, the tar does not penetrate the fibres equally, and by use the cordage is liable to become loose and spongy. But it is confidently believed that hemp, dressed by the Hemp and Flax Machine, and afterwards immersed in water and exposed to the action of frost, will be free from the gluten complain-

Hemp is considered a very hardy plant, resists drought and severe frost, is easier cultivated, less vegetable crops. It may be grown year after year on the same ground, well manured, and has been cropped from the same ground in England

feet, according to the strength of the vine, and cossfully performed by allowing the stock to have be two bushels to the acre, and on very rich the preceding summer, on the outside horizontal hemp may be cut close to the roots. When sown produce the truest specimens of the parent fruit, the blossom stalks or male hemp will be seen to In cutting from decaying trees, the central shoots, hang over the field. If allowed to stand longer, colored, and the coat will be of little value. The A mode of engrafting has been practised which way to secure seed for the succeeding year, is to sow a patch thinly for that purpose, at the rate of half to three-fourths of a bushel to the acre, but stock is cut into a wedgelike form, having the the better way is to sow in drills or rows. Cutting is preferable to pulling; a man will cut from half to an acre per day, but can pull only about one-fourth of an aere; and cut hemp will bring more by the ton than pulled. In gathering the ner bark made to meet. It may then be secured bemp, it should be sorted into long and shortby bandages and surrounded with clay. The ad- Fine and soft hemp is the best; the American is sown too sparingly.

It is said that the usual mode of water-rotting on Connecticut River is very imperfect.

It is found that the crop of hemp varies according to the richness of the soil, quantity of seed sown, gathering, retting, and dressing. Some cstimate an average erop per acre by water-rotting, in America at 100 lbs. (others say from 500 to 800 lbs.) in England 650 lbs., in Russia 500 lbs., but it is acknowledged that hemp dressed by the improved machines, yields a much larger quantity.

Let not Children be Rocked .- A foreign writer finds fault with the prevalent practice of rocking children, and considers it as the cause of many diseases. He asks, and with much reason "When the human offspring first begins to make use of its faculties, and to give proof of its being sensible to existence, even should this be done by infantine eries, is it right to stop those cries and to prevent its paying that tribute to nature? The rocking of the eradle brings on sleep only through the stupor it produces on the senses. Such a motion cannot but offend the delicate fibres of the brain of an infant, injure his digestion, sour the milk from which it derives its nourishment, and turns it into

Physic for a Horse .- A friend informs that the herb called Motherwort, is an excellent cathartie for the horse. A strong decoction may be made and mixed with Indian meal, or given with a horn or other means, if the horse will not eat the meal when mixed with the decoction. It is an excellent remedy against worms in horses, as our informant has verified by experience.

Sick Headach .- A teaspoonful of finely powdered charcoal, drank in helf a tumbler of water, will in less than fifteen minutes give relief to the sick exhausting, and more profitable than many other headach, when caused by a superahundance of acid on the stomach .- Newburyport Herald.

Hops .- The young shoots when three or four seventy years in succession. The usual quantity inches in height, are sometimes boiled like asparaFrom the New York Farmer.

The Climate of the Middle States compared with that Horticulture. By J. BUEL, Esq.

greater; while the mean temperature of the winter months is probably fifteen degrees colder here than in England. These estimates are conjectural, not having data to render them accurate.

In testing the adaptation of the climates of the two countries to the various productions of the garden, I shall assume as a general rule, what I believe will not be denied, that plants flourish best, and most fully develope their valuable properties in the temperature and soil in which they were originally planted by the hand of nature, and that from their native location. "The American and land. African plants, says Macphail, (Gard.'s Remembrancer, p. 54,) which are said to be famous in are believed to do equally well in the Middle medicine when of the growth of their native soils, States; while many varieties which mature their yet when they are removed and brought into our fruit well here in the open grounds, in England climate, (England) though they grow, and even require the aid of expensive walls of stone or brick. produce their flowers, and ripen their fruit, which | "To bring the finer sorts of pears to perfection in is the last perfection of a plant, when put to trial, this country, (England) says Macphail, they reit is said by skilful men, they have always been quire to be planted in a border close to a high found to want their medicinal virtues." Heat is wall, and to have their branches trained against It has been greatly improved by culture in Great as necessary an agent in perfecting the fine flavor the side of it, about nine or ten inches apart."of American and African fruits, as it is in maturing (Gardener's Remembrancer.) the medicinal virtues of their plants. The varieties are many, and regard to the peach, apply equally to this fruit. - experience of this country has not been sufficient differ in their habits somewhat, according to the It grows freely with us, but the fruit is very liable to enable us to judge how far we can cultivate climates in which they originate. The splendid to rot on the tree ere it is ripc. Managed as wall the European varieties in the open ground, From

the samples exhibited to the New York Horticultural Society, I understand the opinion to bave been pronounced, by the intelligent horticulturists of that Society, that we can cultivate them successfully. I have seen several varieties fruiting in perfection as far north as Clermont, Catskill, Athens, Albany, Troy, Stillwater, and Ballston, and have known vines to withstand the severity of our winter without covering. In many localities, and in particular seasons, the fruit is apt to be destroyed by mildew. Observation and experience may enable us to discover the eause, and to apply the remedy. But without depending on foreign varieties, we have an abundance of native kinds, every way adapted to our climate, and our wants, both for the table and for the press, as the experiments of Adlum, Gimbrede, and many others amply demonstate.

Twenty years practice in cultivating and multiplying our native varieties, with the zeal for horticultural improvements which now pervades the

fruit in the London market, which I propose hercafter to quote, will show that it is cultivated in Britain at so great an expense, as to place it altogether beyond the means of the mass of the British population. It will not be necessary to show that the melon is a very common product of our gardens, because all know that it is sold in our markets in great quantities, and at very moderate prices.

The Cucumber is somewhat more hardy than the melon, but yet too tender for an English summer. Hence, to adopt the language of London, p, 627, it is forced in pits, hot-beds, hot-houses; and the heat of fire, steam, and dung, are applied to its culture. " As far as I know, says Macphail, the vegetable called cucumber, does not, in any part of this country, come to any great degree of labor required in the two countries to bring the pro- large. Therefore, as the natural heat of the climate is deficient in its production, those who wish to have it in perfection must have recourse to art to supply the insufficiency of nature." (Gar. Rem. p. 39.) southern counties the cucumber is pretty extensively cultivated for pickles, in the open ground. With us this fruit is as common, to all classes, in its season, as the potato.

And yet The cabbage, in its varieties, therefore, occupies a we cannot withhold from our parent country, our large portion of an English kitchen garden, at admiration of her successful efforts to remedy the least an eighth of the open quarters, according to defects of her climate. Science, industry, and Loudon. With the exception of the good people perseverance, have combined to elevate her hortiof Bergen, our countrymen are not celebrated for raising great quantities of this vegetable. The cauliflower and broccoli are of but comparative modern culture among us; but they promise to by it. furnish a cheap and constant delicacy for our tables. I will make a remark here which will ap- am induced to believe, that the climate of the ply to most of the garden products of the two Middle States is better adapted to the culture of countries; the period of culture is longer in Great the apple, pear, peach, plum, nectarine, apricot, peculiarities of the different sorts, and there is con-Britain than in America, and of course involves grape, cucumber, and melon; the finer varieties siderable latitude in the properties of this excellent

crop, the last of May and first of June.

The Bean forms an important article of summer diet in both countries; but the varieties cultivated are very different. In England the cultivation is principally confined to the Broad Pods, (Vicia Faba) such as the Windsor, &c. and to some of the bardier Dwarf Kidneys. With us the Dwarf Kidneys are preferred to the Vicia Faba, and both give precedence to some of the runners, particularly to the Lima, which is esteemed above all others, and which, I believe, is not attempted to be cultivated in England, and certainly cannot come to maturity in that climate.

For other productions of sown in March and April, and those for the main the garden, I do not know that there is any material preference to be given to either.

From Loudon's Gardener's Magazine,

On the great Height to which the Culture of the Gooseberry has arrived, with some remarks on their different Peculiarities. By Mr Joseph Clarkson.

Sta-One of the most surprising subjects in modern gardening is the improvement which has taken place in fruit during the last fifty years, especially in that of the gooseberry. By consulting the gooseberry-growers and their records, I find that the heaviest berries at the commencement of The Pea, Beet, Carrot, Parsnip, Onion, Salad, the above period seldom exceeded 10 dwts. It

The perfection of gooseberry fruit owes nothing to men of scientific knowledge, being cultivatprovement in the English culture, viz. to plant the ate part of society, at least in this neighborhood; second season the small bulbs which form the first, but, by continued experience, and perseverance This practice is not known in the State of New in growing and raising new sorts, they have brought the fruit from 10 to upwards of 30 dwts, and that, too, under the greatest disadvantages, not having the privilege of soil, manure, situation, &c., like the gardeners of their more wealthy neighbors, but oftentimes limited to a few yards of land, either shaded by trees, confined by buildings, or bimited in their culture and use. Of this class is exposed to the most unfavorable winds, and so the water melon, tomato, pepper, okra, sweet po- barren that they have frequently to carry on their tato, pumpkin, squash, egg plant, maize, &c. The shoulders a considerable way the soil in which the superiority of our climate for these productions, plants are to be set; yet so resolute are they in overcoming every obstacle, and so successfully in-There is another consideration entitled to weight genions in assisting nature in her efforts, that they are enabled to produce fruit surprisingly

I have made inquiry of the oldest growers I could meet with, some of whom are upwards of eighty years of age, but I have not been able to ascertain the time when, nor the place where, the improvement of gooseberry fruit first commenced. I have met with lists of several meetings which took place in 1786, in which I find the fruit diwhite; each class containing four sorts, making sixteen sorts at one meeting, no one sort being allowed to win more than one prize at the same show. The classification of the fruit, the number of meetings held at different places, and the variety of sorts cultivated at the above time, sufficiently prove that meetings must have been held for exhibiting the fruit several years before.

The attention of the growers was early directed to the raising of new sorts, being encouraged thereto by the liberal price given for each sort that was deemed to be a large one, all other properties being of a secondary nature; so that we are now furnished with an extensive variety, possessing excellent qualities, both for size, quantity, heauty, and flavor. I would here observe, for the information of those who have no experience in gooseherry-growing, nor any knowledge of the fruit, some sorts being remarkable for their large size, such are the Roaring Lion and Eagle; oth-Sovereign, Bonny Lass, and others; some, again, are remarkable for their rich flavor, and others for producing large quantities; some sorts have their large and numerous berries; some sorts are ripe early, as Top Sawyer, Huntsman, Rockwood, &c.; Duckwing, and several more. Now, unless a person knows the names and peculiarities of the different sorts of gooseberries, he is not likely, when he gives an order for plants, to be suited according to his wish, as there are several sorts not worth I am sir, &c. growing.

JOSEPH CLARKSON.

Blackley, near Manchester.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, APRIL 24, 1829.

NOTICE.

A special meeting of the Massachusetts Horticultural Society, will be held on Tuesday, 28th inst, at II o'clock, A. M. at the office of Zebedee Cook, Jr, in Congress street.

R. L. EMMONS, Record'g Sec'y.

NOTICE.

The Board of Counsellors of the Massachusetts Horticultural Society are hereby notified that their meeting stands adjourned to Tuesday, the 28th inst, at 12 o'clock, A. M., then to be holden at the office of Zebedee Cook, Jr, in Congress street.

R. L. EMMONS, Record's Sec'y.

THE LATE MR WEBSTER.

The notices of the untimely decease of this good and eminent man, which have appeared in our newspapers, are already before our readers: and we can add nothing of importance respecting this melancholy subject. We are not willing, howtestimonial of regard for a man whose merits were so conspicuous, and whose loss is so greatly and so widely deplored.

In the afternoon of the 10th inst, the Hon. EZERIEL WEESTER, while addressing a Jury, in gives your cattle practical lessons in the art of the Court House, in Concord, N. H. with every appearance of full health, and that ability for which he was justly distinguished, fell deprived of cannot sleep in peace, nor quietly enjoy the fruits sensation and of life.

the worthy deceased, is not our province; but we and rather exceed than fall short of what a correct are happy to perceive that this duty has been ably performed by the accomplished Editor of the New Hampshire Statesman, in that paper of the 18th inst. From this we shall quote a paragraph, which describes some traits in the character of Mr Webster, which agriculturists are more particular- the top part in the ground; and asserts that they ly called on to imitate.

"He was a practical and skilful farmer. Living in the country-enthusiastically attached to the healthful and virtuous pursuits of rural life, and to place the rails with the heart side up. the quiet and happiness, and simplicity, of domeswas the principal concern of his neighbors, the

founder, a very efficient member, and subsequenters, again, are remarkable for their beauty, such ly the President of the Merrimack Agricultural are the Lancashire Lad, Top Sawyer, Rockwood, Society-the associates of which will deeply feel and lament his loss. By exciting attention, in his vicinity, to improvements in the breed of animals, in fruits, grasses, grains, and the various valuable fruit large very early, while others are small until productions of the earth, and by examples of betnearly ripe; some, again, bear large berries, but ter modes of husbandry, in draining, reclaiming, only a few of them, while other sorts bear both and other agricultural processes, Mr Webster sought to be useful, without regarding the expense to himself of what he foresaw to be ultisome, again, continue to grow much longer than mately serviceable to the farmer and to the comothers before they are ripe, such are the Printer, munity. His own farm, inherited from his father, became, under his eare, one of the most improved and best cultivated, as it is one of the most pleasantly situated and valuable, in this county.'

DISEASE IN PEAR TREES.

E. Hunt, Esq. of Northampton, Mass. an intelligent hortienkurist, has sent us a branch of a Bergamot pear tree, bearing the marks of a disease with which we are masquainted. It is covered with a black coating resembling rust or mildew in wheat, and appears as if it were partly dried, and in a degree scorched and slightly charred by heat. We should be glad to submit this branch to the inspection of connoisseurs in the diseases of vegetables, and hope thus to ascertain the cause and the remedy of the evil.

WEB WORM.

In our paper of the 10th inst, page 299, we published remarks respecting an insect on fruit trees, called the Webworm, from a correspondent with the signature "P." In this it is advised, when a branch is infested by the insect, to "amputate the limb and burn it." A friend, who is a cultivator of fruit trees, assures us that it is not necessary to cut off limbs infested with this inseet; but that it will answer quite as good a purpose to pluck off' and burn the leaves on which it

SPRING WORK.

FENCES.

The first object of a farmer's attention in the ever, that our columns should be destitute of some spring after the frost is so far removed as to permit driving stakes into the ground, should be his fences. This work should be done thoroughly .-An insufficient fence is worse than no fence, because it not only fails to protect your crops, but jumping. When a farmer is conscious that his fences are such as do not afford full security, he of his labors. It is, therefore, better to take a lit-To give an eulogy, or biographical sketches of the extra pains with this part of rural economy, fence viewer might deem indispensable.

Post and rail fences, are, probably, more used in New England than any other; and are, perhaps, in most cases justly preferred. Mr Preston of Stockport, Pa. recommends to set posts with will, in that situation, last three or four times as long, as when they are set with the butt-ends down. He also advises in making fences always

Dr Deane observed that "the best timber for tic scenes-he was strongly inclined to be con- rails is cedar: It is easy to split, light to carry cerned in and to cherish that great interest, which and to handle, sufficiently strong, and the most agricultural friend, a few hundred Silk Worms, durable of any A rail of cedar will last an age. for gratuitous distribution.

cultivation of the soil. He was the most active Next to cedar, rails of chesnut, white pine, and ash are best. But, for want of better, some use rails of oak. Cedar is also best for the post, in this and in board fence. The locust tree is said to be excellent. But posts of white oak, which in most places are more easily got, will last about fifteen or twenty years. If the lower ends of posts are scorched in a hot flame, before they are put into the ground, they will last the longer .-Also soaking them in sea water will tend to keep them from rotting."

EARLY POTATOES.

The best time to plant potatoes for winter's use, feeding stock, &c. is said to be about the latter end of May, or the first of June; but it would be good economy, generally speaking, to plant an early sort on early ground, to feed swine before Indian eorn becomes sufficiently grown for that purpose. These should be planted the last of April or beginning of May.

Coarse manure answers best for potatoes .-Fallen leaves taken from the woods are recommended by a correspondent of the Bath Society in England. This kind of mannre, says the liter, causes potatoes to be much more mealy, and of a finer flavor than when they are produced by the application of ashes or dung.

The following judicious observations on this subject are from the 2d volume of "Memoirs of the Board of Agriculture of the State of New York."

" Potatoes should be planted the first ten days in May, or a little before the planting of Indian corn. But it is better to postpone the planting of potatoes than of corn. Therefore in the hurry of spring work, farmers often leave their potatoes to be planted in the last week of May. To plant them early will never injure the erop at any season, and if the season happens to be very dry about harvest time, the crop will be much better if planted the first of May.

"Seed potatoes should never be cut-one large whole potato is sufficient for a hill. The outside skin of the potato, called the caticle, is the most durable part, and retains the moisture for the use of the young plant, until it is all exhausted. If potatoes are cut the nutritive juice is absorbed in a great measure by the earth. The evil of cutting seed potatoes is more manifest on a dry soil than if moist. It is a mistaken opinion that a whole potato is not good, on account of bringing the plants too near together; for the roots will yield all we seek for, spread in all directions, and fill the hill.

"Potatoes, if planted in a sandy or loamy soil will yield one third more, if a table spoonful of plaster be thrown upon the naked potatoes in each hill, after they are covered.

"Yard manure is very useful, if laid over the potatoes in each hill, and after an inch of soil has been laid upon them; and then the hill covered as deep as usual. But if the manure be laid directly upon the seed or under it, a drought will injure the crop.

"The most convenient method of raising potatoes is to plant them about the margin of eorn fields. Then a horse may turn upon them, when ploughing among the corn, without injury."

The Editor of the Delaware Advertiser, under date of April 2, says that he has received from an

We have received from Hen. OLIVER FISKE, of Worcester, for the Massachusetts Horticultural Society, a quantity of the seed of the genuine Cuhe tobacco, for gratuitous distribution,-Also, from Mr BARTLETT, of Newburypert, several scions of the fine Yellow Gage Plum,-of the English Pearmain apple,-and of a fine native Apple, planted by Mr B. 31 years

MISCELLANIES.

FOR THE NEW ENGLAND FARMER.

SINGULAR FACTS.

Some few years since, a young gentleman of Massachusetts, Mr S-, then a student at College, happened in company with a young lady; the consequence was a mutual affection took place. Each was conscious of the deep rooted passion, but neither knew the sentiments or affection of the other. Mr S- being at that time under no circumstances to marry, thought not proper to pursue his inclination, or reveal his affection to the lady. She, on her part, not imagining that Mr S- had an affection corresponding to that of her's and not expecting ever to be addressed by him, was courted by Mr B-, and shortly afterwards engaged to marry him :- They were published, and the time for marriage appointed. The lady happened to have her nuptial suit making near where Mr Swas-he fell in company with her again, and understanding that she was on the point of marriage, let her know, that it had been his design ever since his first acquaintance with her, to offer himself to her in marriage, as soon as his circumstances would admit. She asked him whether he was sincere in what he said-he assured her he was, and that he had an affection for her from the first time he saw her, which, instead of being lessened by time, was increased. Hereupon she frankly owned to him, that from that time she had to the present moment an affection for him, and that had she known that he had a similar one for ber, she never should have admitted the addresses of Mr B ... much less have made him a promise of marriage. But what could they do? The day appointed for the marriage ceremony was near at hand. All was consternation. However, on consultation, they agreed that Mr S- should go and state the affair to the father of the lady. He rode with the speed of a post, found the old gentleman at home, and opened the case to him without delay. He had scarcely ended when Mr B- entered the house. After compliments, the old gentleman informed Mr B- of the errand of Mr S ... Upon which, they both requested the old gentleman's advice in the matter. He told them the case was new, unexpected, and surprising to him; he knew not what to say; that at present he could give no other advice than that they should both go to his daughter, and that they should there endeavor to settle the matter amicably among themselves. The young gentlemen then set out together to visit the lady, on this all important business. The one could, with propriety, claim by solemn promise, the other by previous affection. On the whole, they agreed that Mr B- should visit her first, and that Mr Sshould come at a time agreed. The reader is left to judge of the anxiety in the minds of Mr Band the lady at their interview, and of Mr S-in his absence, when minutes moved on with the pace of a snail. Mr S- waited impatiently for the appointed moment, and then attended. The lady told Mr B- that as she had proceeded so far, if he insisted on her being married to him, she should not refuse: But at the same time told him, that Mr S- had a greater share in her af-

ment. Mr S- married the lady and lived happily. But mark the sequel-Mr B- and the sister of Mr S-being on a distant visit, chanced to meet, began an acquaintance which issued in their marriage. They all lived in perfect harmonyand Mr B- in his humor, often said, that he had a wife as much better than the other, as she had a husband better than himself.

Remains of the Mammoth .- On Saturday two tusks of the Mammoth brought home by Captain Beech, were exhibited, and described to the Wernerian Society, by Professor Jameson. . They are in fine preservation, and not bent in one direction, but twisted spirally, like the horns of some species of cows. The smallest, which is quite entire, is 9 feet 9 inches in length; the largest, which wants a small part of the point, must have measured originally twelve feet. Judging from analogy, Professor Jameson stated, that the Mammoth to which the largest belonged, must have been 15 or 16 feet high, and consequently larger than the elephant, which is an animal of the same species. They were found on the west coast of America, near Behring's Straits, at Escholz Bay, latitude 66, in a very remarkable bluff, which has been described by Kotzebue. The bluff has a covering of earth and grass, but Kotzebue, while encamped on it, having cut through the surface for some purpose, was surprised to find, that what he took for a portion of terra firma, was in reality a mountain of ice, a hundred feet in height above the water, but attached to the land as such icebergs generally are. This discovery led to another still more interesting. It was found that this mass of ice had imbedded in it a vast number of the tusks, teeth, and bones of the Mammoth, of which the objects we have described were a part. These remains must have been enclosed in the ice by the same catastrophe that buried the Mammoth, which was found entire in a similar envelope on the hanks of the Lena thirty years ago; and that catastrophe beyond a doubt was no other than the general Deluge, which extinguished the race of animals the remains belonged to. The hones, tusks, &c. were numerous, and some parts of the ice near the place where they were deposited had a smell of decayed animal matter, arising no doubt from the decomposition of the flesh.—
The tusks are in their natural state, but of two teeth which accompanied them, one seems to be early Mohawk Dwarf string Fine-apple Melon no doubt from the decomposition of the flesh .petrified, having doubtless been in contact with stone. The Mammoth secms to have been an inhabitant of nearly the whole northern hemisphere, its teeth or bones having been found on both sides of North America, in Siberia, in England, Scotland, Italy, and other European countries. The remains, however, found in Ayrshire, and in various parts of England, belong to a smaller species than that which furnished these tusks. The Edinburgh Museum is indebted for these valuable relics to Lord Melville, who has never been unmindful of its interests, when his official station enabled him to do it a service .- Scotsman.

Sickness .- Health is certainly more valuable than money, because it is by health that money is procured; but thousands and millions are of small avail to alleviate the protracted tortures of the him, that Mr S — had a greater share in her affections than he had. Mr B— had more good sense, than he had. Mr B— had more good sense, than to insist on her giving him her hand when Mr S— had her heart. Mr B— returned when Mr S— had her heart. Mr B— returned home and shook off the effects of the disappoint— take shelter in the arms of sickness.—Dr Johnson.

Kenrick Nurseries in Newton, near Boston. For sale, at the KENRICK NURSERIES, IN NEWTON, an extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots,

Pears, Featnes, Films, Cherries, Apricos, Nectarines, White Mulberries, Grape Vines, Gooseberry and Currant Bushes, &c. Also, varieties of the most ornamental hardy trees and shrubs-including nearly 50 superb varieties of hardy roses, comprising white and red moss-single yellow, double do-yellow Austrian -red and vellow Austrianblack mottled, sable, Tuscany, and other varieties of the blackest roses-Unique White Provence, &c.

Also, GREVILLE Roses, and WILMOT'S SUPERB STRAWBERRIES.

Apple Trees of extra sizes-also Flowering Horse Chestnuts, and some other sorts.

Written orders directed to John or William Ken-RICK, NEWTON, will be received by the daily mail, and Brick, Mewior, will be received by the unity man, and promptly attended to—or they may be left at Mr Joseph Bridge's Grocery and Seed Store, No. 60. Court street, Boston, where, on application, catalogues will be delivered gratis-or, catalogues may be obtained of Mr J. B. Russell, at the New England Farmer office.

New Vegetable.

Just received at the New England Farmer Seed Slore, 52
New Berr, from London. This is pressible to he fe first seed of this fine vegetable, ever brought into New England, For Sale in papers of 12-12 cents each, or in larger quantities.

Cow for Sale.

A fine cow, half blooded, Coelebs hreed, is offered for sale at the House of Industry farm, South Boston.—Also, three-fourths blood Calf. Inquire of W.M. STONE, Superintendent. April 3, 1829. 41

Fruit Trees.

otic, to forward their orders immediately, and they will be executed with every possible despatch. They also have several hundred genuine Isabella Grape Vines, by the hundred or single plant, with the superior European kinds in cultivation in this country. Letters directed to F. & I. Winship, Brighton.

P. S. Asparagus roots from one to four years old. GAII orders left with J. B. RUSSELL, at the New England Farmer Seed Store, 52 North Market street, will be executed at the Nursery prices, and the trees delivered in Boston, free of expense for transportation.

Brighton, March 11, 1829.

Buel, Esq., written for the New York Farm- months, and in the raining season would be near er; and to illustrate his opinion as to its absorbent so rapid at that depth under ground as it would ing the plant with water by atmospheric absorpand retentive qualities as to moisture, he has given hear the surface. Neither are we informed how us one of Johnson's tables, exhibiting the absorb- far the level of the springs was below the surent and retentive powers of different substances, face, or what the soil, or subsoil, or bottom was where the experiments were tried.

Yours very respectfully, Bridgeport, March 17, 1829.

Remarks by the Editor .- * The atmosphere althan one immediately beside it without plaster, or clouds; or being entirely separated iro. its though in other respects equal, and even when menstrum, it will be precipitated in rain or dew.

The power of soils to absorb water from air is with it in the morning, when the other would be much connected with their fertility. When this Power is great, the plant is supplied with moist-That gentleman, or some other, who has works are in dry seasons; and the effect of evaporation low, but the top level with the surface of the on philosophy and science to resort to, would, no in the day is counteracted by the absorption of earth. doubt, be doing a service to us green farmers, in aqueous vapor from the atmosphere. Sir Humphgeneral, by informing us also whether they have rey Davy says "I have compared the absorbent any other moisture than that which is furnished powers of many soils with respect to atmospherthem by rains and dews, and from what depth ic moisture, and I have always found it greatest they are capable of drawing up that moisture, in the most fertile soils."-Agricultural Chemistry,

The leaves of living plants possess, likewise, a them after it has settled beneath their roots, at power to absorb moisture from air. Some vegetimes when there is no rain.* And whether the tables increase in weight from this cause, when water is by any and what means drawn up from suspended in the atmosphere and unconnected the level of the springs which furnish our wells to with the soil. The house leek, different kinds of the surface of the ground, supposing that surface aloe, &c. will grow when suspended from the be 16 or 20 feet above said springs? † Or if ceiling of a room. Sir Humphrey Davy says "In plants on land, having a clay subsoil, or bottom, very intense heats, and when the soil is dry, the are furnished with any other moisture than that life of plants seems to be preserved by the absorbwhich comes of rain and dews; and whether such ent power of their leaves: and it is a beautiful soils are the best in general both in wet and dry circumstance in the economy of nature, that aqueseasons? ‡ A knowledge of these facts would our vapor is most abundant in the atmosphere seen beautiful peach trees which I was told were assist to correct or confirm many various opinions when it is most needed for the purposes of life; respecting soils and situations, breaking up of and that when other sources of its supply are cut off this is most copious."-Ibid p. 144.

There is a difference in soils not only as resedition, under the head of Evaporation, informs us pects their power to attract moisture from the atmosphere, but also with regard to their power to placed round two of them coal ashes, which were rclain moisture. If this were not the case we certain the quantity of water raised by evapora- should not find the variety of wet and dry soils tion in a year, and estimates the amount to be from on the same level, same latitude, exposure, &c. which actually exists.

† Perhaps something may be effected, in drawof the springs under ground, or the rains as they molecule of water attached to it by n slight affini- my trees.

fell and soaked into it. § If from the latter only, ty, which it is ready to deposit on plant, soil, or

f "The soils that are most efficient in supplytion are those in which there is a due mixture of sand, finely divided clay, and carbonate of lime, common lime with some animal or vegetable matter: and which are so loose and light as to be easily permeable to the atmosphere. With respect to this quality, carbonate of lime and animal and vegetable matter are of great use in soils; they give absorbent power to the soil without giving it likewise tenacity. Sand, which also destroys tenacity, on the contrary gives little absorbent pow-

The power of plants to absorb moisture from the air may account for the appearance of dew dropping from corn, which had been dressed with plaster, as mentioned by our correspondent above. It was not the minute quantity of plaster existing in the plants, which enabled them to attract and retain dew, but the luxuriance of their vegetation, which was caused by the gypsum.

§. The evaporation in the experiments alluded to had no connexion with springs, as it emanated from a vessel with a tight bottom.

I The bottom of the vessel was three feet be-

FOR THE NEW ENGLAND FARMER.

GRUBS IN PEACH TREES.

Copy of a Letter from M. PARMENTIER, to the President and Members of the Horticultural Society of the City of New York.

SHorticultural Garden, Brooklyn, L. I. Jan. 26, 1826.

GENTLEMEN-As it would be desirable to know and try every possible means that can diminish the destruction of peach trees by grubs at their roots, I take the liberty to communicate all that experience among various friends and neighbors has brought to my knowledge.

In New Jersey they make use of rotten fish, put in the spring at the roots of the trees. I have thus freed from worms. This remedy presents another advantage; the rotten fish being a very good manure.

A gentleman of respectability, of Brookline, L. I., who had purchased 4 peach trees from me, thus happily preserved. But the others suffered the ordinary depredation. The above means receive confirmation in France, and in England, where they use the soot of the same combustible, and also of wood to destroy the white grubs; the quantity that falls in a year. But we are not in- ing water from a considerable depth beneath the soot of these substances being very acrid. This is formed whether that evaporation or any part of it earth's surface, or the level of the springs by ca- a convenient and easy remedy, which might be was supposed to have been raised from the level pillary attraction. But every particle of air has its generally used, and I have adopted it for many of understand, adopted by the Governor of Connecticut, Mr Smith, which consists in covering the until the end of August, in order to guard its sur- to it. face from the deposition of eggs by the fly, which is said to cause the mischief.* I am told that by this means he has preserved all his trees to full age, and good health. This process was announced in February, last year, by my friend, Dr Pascalis, of New York, who appears to have paid much attention to the subject, while he resided in Philadelphia. He says that the matted sheaf of straw, hound round the tree, need only extend quite down to the lower part of the trunk, because the eggs deposited are ejected out by the guin oozing from the bark, and destroyed by drying, except at some height from the earth.

It is very pernicious to use fish oil on trees, as it shuts the pores hermetically, and, preventing tree.

Your personal influence, and that of other menibers, could extend these practical and useful remthought it my duty to recommend them.

With great respect I remain, Your obedient servant.

ANDRE PARMENTIER. DAVID HOOSACK, M. D., President) of the Hort. Society of New York.

INSTRUCTIONS FOR SOWING THE MUL-BERRY SEED.

We have often heard it said, that there are White Mulberries enough in the United States, indigenous or imported, to supply us with seeds, answer that there are no facts on record, in this or any other country, establishing that this plant when raised from foreign seeds, is of a quality inferior to the same species more anciently imported, or supposed indigenous. On the contrary, we see that all the silk countries keep up a constant interchange of the plant, to perfect or improve its varieties either from seedlings or by grafting .-And also we think it very questionable whether the business of gathering the seeds of the white mulberry, which requires important care and choice, and preparations, is followed up in any part of the United States, or, if it is, whether enough could be obtained for a whole district, and we be enabled to present to our fellow citizens a chance for more than a million of trees. The seeds we offer, which appear uncommonly fine, have been selected from a latitude, which, as a wintry one, is very similar to our own; and this circumstance does away the only exotic character which might be apprehended.

As for the soil required for them, we have said ; that any refuse land, in a farm, which was unpropitions for ordinary sorts of produce, might, if not altogether sterile, be turned into a profitable nulberry orchard. This remark is, however, not the drill, and covered with earth, the drills being applicable to the propagating of the plant for seedlings. The seed must be sown in some small spot of ground possessing every requisite principle

Another effectual and ingenious expedient is, I of fertility for vegetation; remembering that this ing is simple, sufficiently safe, and easy even to body or trunk of the tree with straw, from June or hardness of the soil are absolutely destructive tween the drills, in such a manner, however, as

trusting these seeds to the ground, or at an early give our opinion in favor of the latter, for the fol- healthy good seeds raised in the open air, than to perhaps even being in a state of forwardness; but the 12th day, at farthest. in the transitions and vicissitudes of our climate, otherwise so favorable, there is a danger of three the first two months, and sometimes afterwards; untoward cases: drifting of the snow, intense these are watering, weeding, and thinning. The cold, and late frosts. It is now, also, most likely first mentioned should be frequently attended to in too late to prepare beds with the digging and the beginning, and so long as the seedlings cannot ploughing necessary for immediate sowing; and, have thrown their roots deep; the second requires transpiration, is often the cause of death to the in this experiment of attempting to stock the to be done whenever any of the old herbs, spontacountry with an infinite number of these valuable neous on that ground, come up in the drills or betrees, we think it would be unwise to trust to tween them; the last, thinning, should not be those slight means of protection, such as mats, long deferred, because mulberry seedlings grow edies, and, in this view of the subject I have twigs, dead leaves, dung, chopped straw, or the the better for being as much as two inches apart, like, which can but poorly counterbalance adverse chances. In fine, in silk countries renowned for the equal temperature of their winters, the spring season is, after all, preferred for sowing.

DIRECTIONS.

The ground for the seeds, being of good soil, and having a warm aspect, requires to be ploughed one foot or more in depth, and spaded up several times; to be freed from old roots, stones, and pebbles; and to be lightly mixed with old manure. If the soil is in a hard condition it should be softwhich would be better adapted to the soil and ened with ashes, soot, or old mould. Towards climate than even fresh ones from abroad. We spring after another ploughing and harrowing, if should be divided and raised into as many beds as are wanted; especially for the convenience of watering, if there is water at hand: these beds should never be so wide but what the centre can easily be reached by the hand. The time for sowing should be the first of April; or immediately after the equinoxial storms in this climate, and a few weeks later on highlands. At such a time, in fine, as there is no danger of long deep frosts .-The seeds now on hand, are mixed with equal quantities of sand; before sowing they should be steeped several hours in water, and left to dry; the next day they must be sown by the hand, in straight drills, an inch and a half deep, and five or six inches asunder, and be covered over with the hand or a small hoe or rake.* This mode of sow-

> * The following mode of laying mulberry seeds in the ground is recommended in a late German work, translated and published last year by order of government, vid. Document 226, letter from J. Mease, &c, p. 57, taken from the work of Mr De Hazzi.

> "Two days before the sowing, the seeds must be steeped in water, and afterwards rubbed upon a packthread, which must be laid in the hottom of made two inches deep," &c.

Something like this singular mode is related by the Abbe Sauvages in his treatise on the mulberry, 1763. He adds, without recommending it, that it by the least impression communicated to one, or great want of common foresight!

kind of seed is very small; its period of germina- those who only amuse themselves with gardening. tion comparatively long; and that frost, drought, It is a good precaution to strow some straw benot to obstruct the view of the straight lines, to Another preliminary remark to be attended to, which much attention must be paid. The use of is concerning the expediency of immediately en- hot beds protected by glasses, or of boxes kept in green houses, is not approved by culturists, from period in the ensuing spring. We shall candidly a sound experience that it is better to trust to lowing reasons and motives. No doubt the seeds run the risks of a change of temperature. Unless could stand the winter under snow. Such a situ- the weather is remarkably cool, and the ground ation they would have in a state of nature, and too dry, the seeds will germinate and shoot up on

> Several cares or attentions are necessary during or even three in the second year. Delay in this operation would render it difficult to conduct it without injuring the roots of those left behind; and when too near to each other, the plants will certainly suffer by spindling. Any delay in thinning is proper which might in a few days show the best seedling of the two or more in a clus-

> Budding, the next thing necessary, consists in clipping or pinching off all the lateral buds from the stock of the seedling, leaving only the middle one, which thereby profits by the whole sap, and strengthens the plant. This, however, should always be done before the leaves unfold, lest the pulling or twisting of the bud should injure materially the tender bark.

> Topping, the last attention necessary, must be done early in the spring of the second year. It is performed by cutting down every seedling with sharp edged nippers, which give no strain to the root. The plants are cut level with the ground. This process is principally intended for the benefit. of the root, and the enlargement of the stem or. stalk, which by the next fall will be more than a foot high, and as thick as the finger.

> The seedlings, to be in a good condition at the end of the second year, require nothing but a healthy body of roots, and a strong stock; anything further for the trimming and shaping of the bushy part will be done in the nursery by grafting or pruning: of all which we will take care to inform culturists in good season.

New York, Dec. 4th, 1828.

FOR THE NEW ENGLAND FARMER.

SOWING GRASS SEEDS IN THE FALL.

Ma EDITOR-In your valuable paper on the sowing of grass seeds, published in the Farmer of the 17th inst, you are pleased to refer to an article,

torn from their tender roots by weeding near the drills, or by a quadruped accidentally crossing the bed; or by some mischievous boy in search of a piece of line; or by the innocent inattention had anciently been used. Be it as it may, the of some person treading upon a drill. There are method is obviously very dangerous to the safety many evils which cannot always be guarded of the seedlings, exposing all alike to be shaken against, but this mode seems to invite risks with a

^{*} My late respected friend, Mr Bosc, Director of the King's Garden of Paris, after seeing several worms, which M. Mi-chaux brought home from America, pronounced them to be the larvæ of the Callidia Flexuosa.

[†] Vid. the Report of the Institute, Evening Post, Nov. 14,

written in February, 1828, wherein the sowing of grass is alluded to; not being, however, the main subject of the article, I request that you will allow me a further, and more full explanation, on this very important operation in agriculture. The sowing of grass seeds in spring, may take place, either with, or without grain; if they are sown with grain, the young grass will suffer greatly by the interference of the roots, and of the straw of the grain: the roots will rob it of a great portion of its nutriment, and the straw will deprive it in a great measure, of the benefits of the atmosphere, air, sun, dews, and rains. Grain and grass thus striving together, are drawn up faster and slimmer, than they would, if sown separate and alone; this forced growth injures the roots of the grass, which at the time that the grain is mowed, is left exposed, weak, and exhausted, to the ardent heat of the sun deprived on a sudden of the shade, which before, was forced on it by the grain. Upon new lands, or such as are richly manured, these injuries may not, perhaps, in common years, prove destructive, but upon our old fields, the chance is truly a deplorable one, and has got to be more and more so, for ten or twelve years past,

Should the farmer prefer to sow his grass seeds alone, and without grain, then a crop of weeds, of various kinds, will start up, more or less overnowering, according to the state of the land; the careful farmer will mow them, make them, and carry, advantage; it acts like a cultivation to it, improvthem into his barn, and console himself with the idea that it is better than nothing; although the growth of these weeds exhausts the land, and so far injures the young grass, yet, unless they should an advisable time to sow it. I have always found be very abundant and thick, the grass will have a it to suffer by the winter when so young, and better chance than when sown with grain, which therefore have occasionally delayed to sow it unof all methods, I am apt to consider to be the worst in this climate, especially if sown with oats, which of all grains used with us for that purpose, are the must exhausting and overpowering. It is visable; upon loams I feel very little anxiety for evident that in the contest between grain and grass, clover, because it will smother the grass, and 1 when sown together, although grain is always triumphant in the main point, which is life, yet the quality of the produce suffers greatly; the roots of the grain are obstructed by those of the grass, and the soil being more or less covered and clothed by the grass, the roots of the grain are deprived of the fullness of the benefit of air, and heat, dews, and rains which they would otherwise have enjoyed. The result is, that out of twenty samples of barley thus raised, nincteen, I expect, upon an average, are slighted by the browers, looking more like hulls than grain, and the price growth of the top and favoring the roots. But, which ought not to be less than one dollar per bushel, to afford a fair emolument to the farmer, has ranged for years past at thirty per cent., or more, under that mark.

We may conclude, therefore, from the exposition of these facts, if correctly stated, that the result of sowing grain and grass is to injure both crops, and very often to loose the grass entirely. Such loss and vexation may be avoided by sowing the grain alone, early in the spring with such manure as has been allotted for the field; and as soon as possible in August, after the crop of grain has been land early enough, and in excellent order for housed, to plough the stubble in, turning a good grass seeds. furrow, that the stubble may have a chance of on agriculture. We alluded to Young's Farmer's Calendar, in field should be cross ploughed, the grass seeds

sown on the furrow, harrowed, and rolled.* It is of much importance in this part of the process to avoid any delay, and therefore it is quite needful to put in the grass seeds, even if the weather should happen to be dry at the time, they will lay safe in the ground, and be ready to improve the benefit of the first showers, when the grass will be tried them with five or six grains of opium dissoon make its appearance, and generally a good progress before the winter sets in. If the winter should prove favorable, nothing further is wanted to secure a good and lasting field of grass, than to draw the roller over it in the spring, as soon as the frost gets out of the ground; this will settle the roots of the young grass, which the frost will always heave up, and which without rolling would be exposed to suffer from an exposure to the sun and to the wind. In case that the winter should prove changeable, with cold turns, and successive thaws and hard rains, then the grass will be exposed to suffer, by being killed in spots, perhaps some of it washed away; in such cases it is needful as soon as the frost is out of the ground, and it is not wet to harrow the field over, and sow some fresh seeds upon such spots as may have suffered, and roll over immediately.

The benefit of the harrow and roller, in these cases is such, as will surprise, and I do believe that if the young grass was in all cases harrowed in spring, and then rolled, it would prove a great ing immediately its appearance as much as a good hoeing does corn, or potato fields. It is needful to observe that if clover is the object, fall is not til spring over the young grass, harrowed and rolled, and all has been well. Upon a gravelly soil which will not retain the grass, clover is adesteem herds grass and red top to be a more valuable crop, they will last much longer, and give a folder of much greater substance. I shall close these remarks by confirming a well settled opinion, that fall, is generally, the most advisable and best season, with proper management and diligence, to sow grass seeds. The sun is then losing gradually its ardency, the earth is cooling with rains and longer nights, it is that state of soil and of atmosphere which is genial to grasses, it assists the rooting, the setting of the grass, by checking the after all, general rules are subject to many exceptions, and particularly so in agriculture, therefore the application and modification of the same must be the study of every attentive farmer, in order to suit them to the nature, situations, and workings of his lands.

With much esteem your friend, Weston, April 25, 1829.

P. S. When grain is not a desirable article to he raised by the farmer, a crop of early potatoes will answer a very good purpose, and leave the

unouldering away, which the showers usually taking place about that time, and the heat of the weather, will generally bring about in the course of 12 or 15 days; before the end of August the source of 12 or 15 days; before the end of August the source of 12 or 15 days; before the end of August the source of 12 or 15 days; before the end of August the source of 12 or 15 days; before the end of August the source of 12 or 15 days; before the end of August the source of 12 or 15 days; before the end of August the source of 12 or 15 days; before the end of August the source of 15 days; before the end of August the source of 15 days; before the end of August the source of 15 days; before the end of August the source of 15 days; before the end of August the source of 15 days; before the end of August the source of 15 days; before the end of 15 days; bef rist has remarked, that grass seeds will succeed almost equally The opinion of our respected correspondent relative to sowing grass seeds in August is corroborated by respectable writers should be to August sowing without corn," [grain.]

POISONING OF VEGETABLES BY VEGE-TABLE POISONS.

M. Marcet's experiments on vegetable poisons are worthy of notice. Having ascertained that bean plants could exist in a healthy state for five or six days if immersed in spring water, solved in an ounce of water; the consequence of which was that in the evening the leaves had drooped, and by the middle of the next day they were dead beyond recovery. Hemlock was equally fatal; and six pounds of dry powdered foxglove (digitalis purpurea) in an ounce of water. began to operate by wrinkling some of the leaves of the bean in a few seconds, which it completely killed in 24 hours. Oxalic acid, though found in sorrel (rumex acetosa) as well as several other plants, proved very fatal poison to others. The absorption of one-tenth of a grain killed a rose branch in flower in 48 hours .- London Register of

Quere .- Do snuff and other preparations of tobacco poison vegetables to which they are applied for the purpose of destroying insects?

PURE WATER.

Some experiments have recently been made in Paris to determine the best mode of purifying foul water, which resulted in a preference to the fol-

Into a wooden cask of any size, set upright upon a stand, are placed two cocks, one close at the bottom, and the other six inches above it. The cask being filled with water, powdered alum in the proportion of something less than half a drachm to each gallon is stirred into the water. No water is drawn out for twenty-four hours, at the end of that time it is taken as wanted from the upper cock, and when no more remains except what is below the upper cock, the water containing the sediment is let off by the lower cock, and the cask is then filled for further use.

TO THE FARMERS OF ESSEX.

The Trustees of the Essex Agaicultural So-CIETY have determined that the Exhibition for the present year shall be at HAVERHILL, on Thursday, the fifth day of October next.

The premiums offered the last years are continned for the present, with some additional ones: a full statement of which together with the Reports of the last year, will soon be published.

Seven premiums are offered the present year for the management of Farms-highest \$30, lowest \$13. Persons intending to claim these preminns must give notice of their intentions to the Secretary of the Society, on or before the 1st of June.

Five premiums will be offered for the best nurseries of White Mulberry Trees, for the making of Silk, amounting to fifty-five dollars, to be paid in

The Trustees propose paying six hundred dollars the present year in premiums, if a sufficient number of meritorious claims shall be presented. By order of the Trustees.

JOHN W. PROCTOR, Sec'y.

Danvers, April 12, 1829.

Among the donations to the Philadelphia Agricultural Society, were some beautiful specimens of silk, the produce of 500 silk-worms, raised and presented by Mrs Adams, wife of John Quincy Adams, Esq. The silk was wound by herself, without baking the cocoons .- Litchfield Enq.

From the New York Farmer.

The Planting of Timber in Europe-and the cultivation of the Sugar Maple, and of Live Fences in the United States.

"I am but one year old," was the response of an aged Persian to the interrogatory of his monarch-" for it was but last year that I began to live for posterity by planting out a tree." When we consider that all the woods of Great Britain have been sown or planted by the hand of man, and witness the rapid diminution of our primitive forests we cannot but appreciate the sentiment of the old Persian, and feel the propriety of imitating his example. The planting and preservation of timber, forms now, in Europe, an important branch of national economy. This highly commendable feeling of planting for posterity, particularly distinguishes the Pomological associations of Germany. An idea of their labors and usefulness may be formed from the declaration of Mr London, the enlightened Editor of the Encyclopedia of Gardening and Agriculture, that in October last he travelled "for six days along a winding avenue of fruit trees, upwards of 250 miles, (from Strasburg to Munich,)" consisting of the apple, cherry, pear, plum, and black walnut. What a delightful feature must this form in the rural scenery of the country, during the seasons of blossoms and fruits. And how easily it might be imitated in the old settlements of our country. The people of Massachusetts are entitled to much credit for their early attention to this subject. While a laudable emulation prevails in transforming their highways into avenues of trees, useful as well as ornamental, the State Agricultural Society is encouraging the cultivation of live fences, and the sowing and planting of forest trees, by the distribution of liberal premiums, furnished in part by munificent appropriations from her State Treasury. New York is great in everything but her agricultural policy. Here agriculture, like a forsaken orphan, is left to struggle without parental care. There is more truth than patriotism in the remark once made by a member of the Committee on agriculture, in our Legislature, that he was opposed to any appropriation from the treasury for agricultural improvements because HE was too old to profit by it, and because he wished to keep things to his own level.

I began these remarks with the view of recommending to our farmers the cultivation of the sugar making as a means of embellishing and en-sugar making as a means of embellishing and en-hancing the value of their estates, of multiplying plants, heretofore considered tender, have become their personal comforts, and in fulfilment of a duty to posterity. The subject was suggested by reflecting on the commendable beginnings which I witnessed last summer in different parts of the State, and particularly in the county of Lewis, of making plantations of this valuable tree. The attempts to preserve the forest growth of this tree have been unavailing. The trees are soon prostrated by winds when the other wood is taken away, and the lands around cleared. But when set out, of proper size, their habits early conform to their location. I saw many acres planted at regular distances, besides avenues of them on the highways. The only faults I noticed were, in selecting tall trees from the forest, instead of more growth are uninjured; those of less age it is pruhumble ones from the borders and fields, and in dent to cover with earth, though not always nedivesting them too much of their branches.

The sugar maple is one of our most valuable trees for use and ornament. Its sap affords an ar-killed nearly to the ground, but in such cases it

factured at the most leisure season of the year .-Its timber is valuable for the cabinet maker and the carpenter, and ranks next to hickory as fuel; its shade is umbrageous and refreshing; its form symmetrically beautiful; and its growth is perfected in almost every soil. A plantation made upon the north or bleak side of the farm buildings, or the fruit orchard, or in belts around permanent enclosures, is highly useful as a protection; constitutes a most interesting feature of rural scenery, and will ultimate in substantial profit to its proprietor, The grounds planted are but very little injured, at least for years, for ordinary purposes of tillage or grass. In districts where the maple is not of indigenous growth, or where suitable trees cannot be obtained for a plantation, the defect might soon be remedied by planting a nursery. Seeds may be gathered by bushels at the time of the early autumnal frosts, or obtained from seedsmen in our cities. They should be sown in the fall or spring, after gathering, upon a bed of good mould, slightly covered, and kept free from weeds. They generally will not grow until the second season. After standing in the seed bed two summers, they should be transplanted into nursery rows, and there nursed till they have acquired size for final

Another subject interesting to the present, as well as to the rising age, is the cultivation of live fences. It is evident that the practice in Great Britain of planting these upon a bank of earth, and on the border of a ditch, is adapted neither to the dry summers nor cold winters of our climate. Nor has our experience yet indicated, with any degree of certainty the plants best adapted to general use. Yet if the information upon this subject, which experience has suggested to individuals, was collected and concentrated, a tolerable system of management might be formed. I would therefore respectfully invite gentlemen who possess practical knowledge, to communicate to the Farmer every information which may tend to accelerate our progress in this useful branch of improvement.

Albany, March 13, 1829.

BOT FLY, OR NITTER. By Professor Eaton, of Troy.

While preparing a Zoological Text-Book for Students, I had occasion to examine the Nitter with considerable attention in the summer of 1826. The Genus to which this fly belongs contains more than a dozen species. Two species are common about Troy, New York, and probably in all the Northern States, which I will here des-

CLASS-INSECTA. ORDER-DIPTERA. GENUS-OESTRUS.

Generic Character - Antennæ (horns) disjointed, very short, sunken ; face broad, depressed, vesicular; mouth a simple orifice; feelers two, two jointed, sunken; tail inflexed beneath.

Equi (lcg nitter) wings whitish with a black band . in the middle and two dots at the tip. Deposits its eggs on the hairs of horses legs, in the month of August. From observations made during the three last summers, I believe this species to be harmless. I do not believe the Bot is ever caus-

Veterinus, (throat nitter, bot fly) wings without spots; body iron rust color; sides of the thorax and base of the abdomen furnished with white hairs. A little smaller and much more agile than the leg nitter. Deposits its eggs in the skin nnder the throats of horses in the month of September, and with them an acrid liquor which gives the horse the pain of a bee's sting, at the instant of contact; hence, this swift-winged species is the dread of horses.

So far, I think, I am justified in giving the natural history of this insect from personal observations. One farther trial is necessary, to complete my proposed account of it. This I have not been able to complete; and take this method to ask the aid of some of the readers of the Farmer .--Whoever has an opportunity to see the Bot in the recent feces of a horse, should put a quantity of it into a close tin or wooden box, of the capacity of a quart or two, and keep it in a warm place, until some of the larvæ become flies. Then determine the species, by accurately comparing them with the descriptions here given. Should it prove to be the species veterinus, we could safely adopt the following conclusions.

1. That the Nits deposited in the skin under

gots) and make their way into the passage to the tunate cause.

· · 2. Should it be thus demonstrated, that the Bot is the larvæ of the throat-nitter, common sense would suggest an effectual preventive. A piece of oil cloth fastened under the throat, for three or or the walnut, with perfect success. It is a tree this county as to believe they are of the same must be a perfect defence.

AMOS EATON.

Rensselaer School, Troy, March 16, 1829.

FRUIT TREES.

Mr W. Hill, of Comb Ilay, near Bath, in his letter to the Bath and West of England Society, on the subject of Orchard Plantation, states, that he had for several years past directed his attention to the cultivation of various sorts of apples, principally table fruit; and he had so far succeeded as to receive from trees of a first year's crop 4, of a second year's crop 12, and of a third ure to see in the "New England Farmer," of Febyear's crop 15 pecks of truit. His method of ruary 13, the piece taken from your paper, signed planting was, after clearing the land, and preparing it for planting, to throw out the soil to the temperature in which Silk Worms ought to be depth of 18 inches, and loosen it about 10 inches kept, and on other subjects. This paper gave me deeper still; the soil so thrown out he suffered to great satisfaction, because it will promote the remain till it became pulverized. When reduced cause of the Silk culture, which I deem highly imto that state, he then proceeded to planting, raising portant to the farmers, and because the sentithe trees occasionally and shaking the roots, ments contained in it, agree with my own experiby which means they acquired a firm and equal ence. standing. He much reprobated the common practice of throwing the soil around the roots of the noticed by the writer, that silk worms will thrive tree in heavy lumps as it was dug up, and then in any temperature, even at that of 90°, will, I treading it in; contending that this process must fear, do mischief. My own experience is decidednecessarily tear the roots, and deprive them of their bark or rind. Most people, he observed, were aware, that if a tree were stripped of its bark, it would die; but planters of trees in many instauces appear to forget that the more tender bark of the roots might be destroyed in the same manner. By adopting the manner of planting be gradually increased. The reasons for this : r which he had recommended, he had last year on given at length in the Silk Manual, published by some plants half a peck, and on others a peck of fruit. The land on which he made these experi- persuaded to regulate the apartment by a therments was considered of little value; but he had mometer, one of which can be purchased in Philno doubt of its being productive of good crops, under this method of cultivating it .- English pa.

GRAFTING AND INOCULATION.

It is not unreasonable to suppose the benefits to be derived from engrafting and inoculation of fruit trees, are far from being fully realized. Aside from the neglect of improving orchards, where there is nothing to prevent but the disposition to procrastinate and delay-so prevalent with allwe believe that the process is of much more extensive application than is generally known, and that it may be the means of introducing the cultivation of fruits, now imported from abroad at a great expense. It has been ascertained that the shag-bark walnut may be successfully engrafted, and that the engrafted trees are much the surest bearers. Where this is not the case, the difference in the quality of these nuts would make it an object to engraft most of the walnut trees .-Some have a very thin shell, and a thick large meat-while others have a thick shell and but little meat. It is probable that the hickory or shag-hark, would do well, engrafted on the pignut. If it should, the quantity raised might be pose of offering premiums to successful competi- in the old and beaten path, despising and ridi

the throats of horses, become minute larve 'mag- | The Madeira nut, which is usually sold at the which I wish to address you will not be out of shops under the name of the English walnut, at place at this time. stomach folds, until they are of a size to destroy 123 to 16 cents per pound, may be cultivated here. It is unnecessary to pain your feelings by a rethat organ, unless they are passed off by some fur- without difficulty, and is very productive. In the currence to the deplorable state of our county in vicinity of New York, there is a tree which has an agricultural point of view; and were it not for produced in a single year, as many as sold in the the hope of better things, I certainly would not inmarket for two hundred dollars. We have no trude on your patience at this time. doubt that it might be engrafted on the butter-nut, four weeks commencing the last week in August, of the same genus, and in its character bears a species as the citizens of other counties, therefore nearer rescablance to the butter-nut than many they are capable of improving in like manner.other trees du to those on which they are success. And that there is an incitement to that desirable fully engrafted. The experiment is worth trying, object no one will pretend to deny-on the conand, if successful, it would soon furnish us, at a trary, perhaps there is no section of the State cheap rate, with a good supply of that excellent where the labor and skill of the Husbandman and nut, without writing the more tardy process of Horticulturist would meet with greater encourrearing the tree. - Mass. Spy.

SILK CULTURE.

Mr Editor-A few days since I had the pleas-"An Agriculturist," on the subject of the proper

The opinion of Mr Gideon Smith, of Baltimore, ly in favor of moderate temperature in all stages of the worm; and it agrees with that of others, who have attended to them upon a large scale .--Even when the worms are hatching, the heat of the apartment in which they are kept, ought not cessary to the husbandman as manure is to the to exceed 81°, and should commence at 64° and soil. Congress. Cultivators of Silk Worms should be adelphia, for \$2,50, of Mr M'Calister, in Chesnut street, for without one, the regular growth of the worms cannot be insured; they will at one time be checked by cold, and at another time unduly stimulated by the heat of the atmosphere.

I beg leave to call the attention of the public to a pamphlet published by the Society in Philadelphin, for the promotion of the culture of silk. It contains a summary of the whole business, as detailed more at length, in the Silk Manual, and should be in the possession of those who cannot obtain the latter work, a large edition of which was distributed among the members of Congress. The pamphlet is for sale by Carey, Lea & Carey, corner of Fourth and Chesnut streets, price 124

A FRIEND TO THE SILK CULTURE. Philadelphia, March 9, 1829.

From the Columbian Reporter.

To the Trustees of the Bristol County Agricultural Society.

I have so good an opinion of the citizens of agement. Our soil is not inferior and is capable of being made as productive, and in time would wear as rich and beautiful a face as some of the famed counties to the north of us. And need 1 remind you that there is but one requisite needful to that desirable object. And as we are able in every requisite, save one, to rank with the first, I look with confidence to your board to lend a hand to supply that deficiency, which is information .-On this alone, in my humble opinion, hangs the fate of the Bristol County Agricultural Societynotwithstanding the denunciations against "your book larning." There is no profession or calling, under the canopy of Heaven, worthy the pursuit of rational beings, that can be successfully pursued, without the aid of books. For it is by repeated experiments that we arrive to any degree of perfection in any art, and books are the medium of such experiments.

I do not mean to be understood that the County of Bristol is in total darkness-I believe there are a few in every town, enough I am confident to prove to any unprejudiced mind, that the book guides the plough; and that knowledge is as ne-

The premiums offered for October, 1828, amounted to \$354, which sum, it is presumed. was paid in money, to individuals in number amounting to eighty-four. Would it not give as general satisfaction, and further the object of the society, to award premiums, or a greater part of them, in books and papers on agriculture, such as the New England Farmer, some treatise on Gardening, on Horticulture, on the Culture of Silk : the Culture of the Vine, &c. agreeable to the choice of the successful competitor?

The knowledge necessary to meet the wishes ot your board cannot be obtained without much read ing and reflection. And books and papers on ag riculture are as rare in the county as the bible is among the heathen-therefore why should we not in some measure learn wisdom from our zealous neighbors of the Missionary School, and commence the work of reform-throw light in their every path, in shape of books and papers. They will read if they have books, and by reading comes wisdom, and its beautiful train of results. Conld this plan be adopted, would not the strong holds of ignorance and prejudice be broken up, and a new and propitious era begin in this dark benighted county.

The manufacturing interest, particularly cotton, have not been slow in their advances to perfec GENTLEMEN-As your meeting is for the purtion-and how was this accomplished? surely not greatly increased, and the quality much improved, tors, at our next annual exhibition, the subject on culing improvements as mischievous iunovatious

but by diligently seeking for every information both in the new and old world.

Accept the best wishes of your friend and obedient servant, ALFRED BAYLIES. Taunton, March 20, 1826.

The subject of the foregoing letter being deemed by the Board of Trustees, one of importance, it was voted to request the author to consent to its publication. A committee was also appointed, with reference to it, to take into consideration and report at the next annual meeting of the Society, in October, the best mode of disseminating agricultural information by books or otherwise, through the county.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY I, 1829.

SPRING WHEAT.

Payson Williams, Esq. of Fitchburgh, Mass. gives the following account of his method of raising a crop of spring wheat, being twenty-eight bushels and thirty quarts on one acre and an eighth of an acre, for which he received the Massachusetts Agricultural Society's premium of forty dollars, Oct. 1819.

The land on which the wheat was sown, was in 1818 planted with potatoes, (for one acre of which I obtained your premium) which after harvesting was ploughed a short time before the setting in of winter. In the spring of 1819, as : oon as practicable, (after spreading on six loads of fermented manure) it was again cross-ploughed .-April 26 sowed on the furrows two bushels of what is known by the name of the Gilman wheat, (which I procured of the Hon. P. C. Brooks, of Boston) on one acre and twenty square rods, and cross-harrowed the same, following the harrow at the same time with the clover seed, which in turn was cross-harrowed in. The wheat before sowing was washed in water until perfectly clean, then immersed in a liquor, or ley made in the proportion of 4 pints of water to every pound of wood ashes, then add I pound of unslacked lime to every bushel of seed, as recommended by M. Du Hamel.-When the wheat plant was out of the ground two inches, I sowed on a part of the field plaster of Paris, at the rate of ten bushels to the acre, which I never have been able to discover has had the least effect. (I had the like ill success in the use of a ton, on various parts of the farm.) The amount of the wheat by actual measure was twenty-eight bushels and thirty quarts. It may not be improper here to state, that on the most close examination, I could not discover one kernel of smutty grain in the whole crop; and had it not been for the ravages of the grasshopper in this field (in many parts of which they cut off one-fourth part of the heads, which were of cours: lost,) there would probably have been thirty-four bushels. I esteem this kind of wheat a valuable acquisition to this part of the country. The grain weighing sixty-two pounds to the bushel, and yielding at the mills in this quarter, forty-five pounds of flour, equal, I think, to the best Baltimore.—Mass. Agr. Rep. vol. vi. pp. 32, 33.

POTATOES.

If the land on which you plant potatees is infested with grubs, or wire worms, it may be well to strew quick-lime over it, at the rate of about in an accompanying letter as follows: two bushels to the acre, immediately after plant-

ing. Or, where lime cannot conveniently be had, continues to bear fully every year-fruit of enorsubstances may be strewed over the hills, after the er. potatoes are planted, and well covered, but should not be put into the hills, in such a manner as to come in contact with the seed potatoes.

A letter from William Moody to the Hon. Josiah Quincy, published in the 4th volume of the Massachusetts Agricultural Repository, page 353, recommends sea sand as an antidote against the wire worm, and, has no doubt it would prove efficacious against other insects, which infest potapersuaded, from experience, that sea sand, put Fruits, &c. under corn or potatoes with manure, or spread on the land, will go far, if not wholly to the total destruction of those destructive worms [wire worms] on which nothing else seems to have any effect. It has a beneficial effect spread on land before ploughing, or even after land is planted with corn or potatoes; not only to destroy the wire worm and other insects, but to increase the crop. With my neighbors a load of sea sand is considered preferable to a load of their best manure, to mix in with their common barn manure, or to spread on their gardens and low flat land."

Mr Moody likewise says in the same letter, "late planted potatoes, which are gathered in before ripe are far the best for seed the next year. If kept in a dry warm place in a celiar, they will be much earlier, and likely to produce more abundantly the next year, and will be as good for use the following spring, though they may not be so good in the fall."

Mr Moody's opinion relative to planting late, or unrine potatoes is corroborated by an article, originally published in the Gardener's Magazine, and republished in the N. E. Farmer, vol. v. p. 409, in which it is stated that "the ripe potato, having performed all its operations, becomes more inert; but the circulation of the sap in the unripe tuber having been stopped, it starts more readily, and with greater vigor when planted :-the one seems to die, worn out with age, the other seems accidentally to have fallen asleep, and when awoke possesses an unspent vigor and energy."

MASSACHUSETTS HORTICULTURAL SO-

At a special meeting of this Society, on Tuesday last, for the admission of members and other business, the following donations were received, and distributed among the members.

From Dr S. L. MITCHELL, of New York, a small package of seeds of ornamental flowers, shrubs, and fruits, recently received by him from Caraccas.

From Doct. Hosack, President of the New York Horticultural Society, a box of kitchen garden vegetable seeds, including twenty new varieties of peas, beans, and squashes, received by him from Mexico.

From Mr WM Wilson, of New York, a package of seeds of the large Apple Head Lettuce, (heads of which were exhibited in the New York markets last season, which weighed 4 lbs. 4 ozs. each) - the New York premium Lettuce, and some the evening, then take it up, and sow it betwist fine Green Fleshed Melons.

varieties of fine native Apples, described by him,

"No. 1. Scions from a very old tree, which still fested with the slug."

it has been recommended to use salt, at the rate mous size—ripens in November—of a rich, nealy, of about a bushel and an half to the acre. These mellowness-a good pie apple, and a great bear-

"No. 2. Scions from the thin skin apple tree, so called - a young tree-bears a yellow apple of a very thin skin, and an excellent fruit for the table ripens in October.

Communications were received, and read, from Joun PRINCE, Esq. of Roxbury, and Gen. Ar-MISTEAD, on engrafting the foreign Sweet Water Grapes into American stocks, which will be published in the next New England Farmer .- Liketoes, while growing. This writer says, "I am wise the Report of the Committee on Fruit Trees,

Votes of thanks to Dr Hosack, and the other gentlemen, who presented the above articles to the Society were passed.

SUMACII,

The Vermont Chronicle, a paper printed in Windsor, Vt, after adverting to the quere on the cultivation of sumach, published page 253 of our current volume, observes that "There are in this region two varieties of Sumach. The larger grows sometimes to the height of 20 feet. Its berries are of a paler red; and its leaves and tender shoots have a hairy appearance. The wood is of a bright yellow, and is used for dying that color, and for inlaid ornaments in cabinet work .-The leaves and berries are sometimes used for dving black, but are inferior to the small kind .-This is seldom more than about six feet high, the berries of a deeper and brighter red, the leave's of a deeper green, and the young stalk covered with a down, such as is found on plums, and some kinds of apples. This, we believe, is the kind used in tanning. On light, loamy, or sandy soils, it grows spontaneously. When mown yearly, it springs up again. In ploughed lands, it is sometimes troublesome, as every piece of the root cut off by the plough, becomes a separate plant. Whosoever will inform our farmers how they may reap a profit from it, will confer a favor on them. Adecoction of the leaves is said to make very superior writing ink; but we have never proved it.'

[The following extracts from English papers, were furnished by a gentleman who will please to accept of our thanks, and will much oblige us by the continuance of his favors.]

Preservation of Lambs from Vermin .- An ointment made of gunpowder, brimstone, and common grease, applied behind the necks of lambs, will infallibly preserve them from all kinds of vermin .-The quantity requisite is so small, that sixpennyworth is sufficient to dress two hundred lambs .-Cambrian.

Destruction of Slugs .- The Sussex Advertiser says the slugs are committing extensive ravages among the wheat. The following is recommended as an effectual mode of destroying them :-"Take five quarters of fresh lime in the morning, put it down in some clean place, and throw eight or ten pails of water over it, which will slack by six and hine o'clock in the evening with shovels. From Mr E. Wight, of Dedham, scions of two This will sow three acres, kill the slugs and revive the wheat, so much sn, that it is scarcely to be distinguished from that which has not been in-

A Great Calf .- A cow, belonging to Mr Jason Williams, of Dana, brought a bull calf on the 5th Phoenix Furniture Warehouse, near the Square, Main Street, Inst, which weighed 102 lbs. Mr Williams offers

avail ourselves of his generous offer .- Lancaster Gazette.

FOSDICK & CARTER, inform their friends and the pub-Stop for another of the same weight at that age.

Alhol Sentinel.

We could have supplied Mr Williams with a fine calf which weighed 100 pounds, from one of our own cows; but we are too far from him to warm of the generous offer Lancaster.

Lancaster which weighed 102 pounds for sale, an extensive assortance, Beds, Bedsteads, Tables, Chairs, Safas, Couches, Stendts, Brands, Brands, Chairs, Safas, Couches, Stendts, Brands, Brands, Brands, Brands, Chairs, Safas, Couches, Brands, Bran all which they will sell extremely low for eash. Purchasers are invited to call and examine.

P. S. Portrait and Picture Framing, executed in the best

manner, and at short notice, as above. Charlestown, April 3, 1829.

For Sale.

A valuable Real Estate in Milton, 9 miles from Boston, on the road leading from Boston to Taunton, Bridge water, and New Bedfurd, containing upwards of 200 acres of the variety of lands and fruits suitable for a good farm, well watered, with good substantial buildings. Said farm is calculated to suit a gentleman of taste, or an enterprising young man for a milk establishment, being an excellent grass farm. The purchaser may have, including the buildings, from 100 acres to the whole.

As the above described property contains a large portion of valuable wood land, the purchaser may be accommodated with more or less of that part. The place will be sold at a fair price, with or without a very valuable stock and

farming utensils.

Also, for sale, or to be let, opposite the above named premises, a large, convenient Dwelling House, with a good Bake House and out buildings, very pleasantly situated for a country seat or a good stand for a store or country baking, with as much land as may be wanted for the accommodation of the same. For further information, inquire of the Editor, of Parker H. Pierce No. 95 State street, of Nathaniel Blake at Indian Queen Tavern, Bromfield street, of A. M. Withington, Roxbury, or NATHAN-IEL TUCKER on the premises.

April 10

Red and White Clover Seed.

For sale at the New England Farmer Seed Store, No. 52 North Market Street,

5000 lbs. Red Clover Seed, 500 lbs. Dutch White Honeysuckle Clover, (imported.) Also, Herd's Grass, Red Top, Orchard Grass, Lucerne, Foul Meadow, Hemp and Flax Seed, &c, &c.

Tall Meadow Oat Grass Seed.

This day received at the New England Farmer Seed Store. 52 North Market street, 20 bushels of Tall Meadow Oat Grass Seed, at \$2,50 per bushel.

Wanted to Hire,

To the 1st Nov. a middle aged woman from the country, to do the work of a family about eleven miles from Boston, where on the work of a family about creven inters from Disson, where other help is kept. Plain cooking, washing, and the care of a small clairy, will be required, and to a steady, industrious person, good wages will be given—no other need apply to Mr J Mr Russell, at the New England Farmer office, North Market

French Gropes.

MISCELLANIES.

SPRING.

Again rejoicing nature sees The blest return of Spring; Ambrosial odors in each breeze, Her sweetest incense bring.

Dread Winter's ley reign is o'er, His frost, his snows are gone; His ruthless power is fear'd no more, And joy invests the lawn.

Th' industrious bee, with soher hum, Each hour her task completes; And to o'ercharge the well wrought comb, Robs nature of her sweets.

You murm'ring brook, that gently flows, Meand'ring through the green, Was late o'erlaid by Winter's snows And envious frost unseen.

You wood, the mountain's brow that crowns, Enrobed in gayest hue; And late deform'd by Winter's frowns, In Spring enchants the view.

Where'er we turn our wand'ring eyes, Fresh beauties rise in bloom; And let's enjoy the bounteous prize, For soon they seek the tomb.

Let moderation gild each scene With charms that cannot cloy; She 'll wisely take the golden mean, And bless without alloy.

Seize harmless pleasure while she lasts, Be jocund, blithe, and gay; For soon December's chilling blasts Shall freeze the springs of May.

The following story of Porson is in Barker's no tices of Dr Parr :- "There was a large company, and the Doctor addressed Porson nearly in these words :-- 'Mr Porson, pray what do you think about the introduction of moral and physical evil in the world?' This was a knotty question .-Conticuere omnes intentique ora tenebant. Porson, after a moment's pause for reflection, answered, with great solemnity or dryness of manner, 'Why, doctor, I think we should have done very well without them."

Milton has the following remarks upon misspent time :- " Hours have wings, and fly up to the Author of time, and carry news of our usage. All our prayers cannot entreat one of them either to return or slacken his pace. The mispence of every minute, is a new record against us in Heaven; sure if we thought thus we would dismiss them with better report, and not suffer them to go away empty, or laden with dangerous intelligence. How happy is it that every hour should convey up, not only the message, but the fruits of good, and stay with the Ancient of Days, to speak for us before His glorious throne."

food for Birds .- To the sportsman, to the gentleman farmer, and to the horticulturist, the knowledge of the habits and the food of birds is indispensable, inasmuch as ignorance on the subject hav often give rise to most serious injury and loss. f'or example, in New England the cultivated grounds were some years ago much frequented fer from abstinence, though they have been forwith a species of crow, and the farmers, suppos- merly intemperate. - Kennebee Courier.

ing that the crops were thus injured, resolved to extirpate the whole race, and offered a price for their heads. The proscription was very successfully carried into effect, but the farmers, instead of being gainers, were severe sufferers. The crows, it should appear, like the rooks of our own country, did not frequeut the fields so much for the sake of the grain as to feed upon grubs, which, after the universal massacre of the crows, increased so numerously as nearly to destroy the entire crops, and threatened a famine. When the error was discovered, the crows were as anxiously protected as they had been formerly persecuted .-Similar instances, in the case of rooks, have occurred in Great Britain .- London Mag. of Natural History.

Grog Drinkers, reflect !- A very young man once got addicted to the use of tobacco, and was entirely cured by a friend who desired him to cast up the sum total of the expense, should he live to the age of 70, at only one cent a day, including the interest annually. The young man found it amounted to upwards of One Thousand Dollars! He at once threw away his tobacco box. Let those who expend from 5 to 10 cents a day in ardent spirits, sit down and count the cost. Ninetenths of them would have cash on band to purchase good farms, and enough left to stock them bandsomely .- Keene Sentinel.

Phenomenon .- In boring for salt-water in Cumberland, Ky, a fountain of Petroleum, [bituminous oil] was struck upon at the depth of about 130 feet. When the anger was withdrawn, the oil rushed up, 12 or 14 feet above the surface of the earth, and it was supposed that about 75 gallons were discharged per minute, and in four or five days had not perceptibly diminished. British oil, which is extensively used in medicine, is manufactured from Petroleum.

Surgical Examinations .- We hear much of the screwing system made use of at the examination of surgical students, and the methods taken to entrap the unwary. Dr Abernethy lately asked a candidate who was undergoing an examination, what he would do if a man were blown up with gunpowder? "Why," coolly answered the tyro, " wait till he came down again." "True," said Abernethy, "and suppose I kicked you for such an impertinent reply, what muscles should I put in motion?"-" Why," said the young man, "the flexors and extensors of my right arm, for I should floor you directly!"

A Question .- Can those who have been for a long time in the habitual use of ardent spirits, safely abandon them?

Let facts answer the inquiry. In the prison in the State of Maine, an important experiment has been made of cutting off habitual drunkards at once, from the use of ardent spirits in every form, and confining them to water. It has been found invariably beneficial. They soon renew their vouth, and a more hale, healthy, muscular body of men cannot be found, in prison, nor out of prison, than the cold-water convicts, in the prison of Maine.

In New Hampshire the same valuable experiment has been made, with the same result. In the new prison at Sing-Sing, New York, among 250 convicts, the men neither die nor sufKenrick Nurseries in Newton, near Boston.

For sale, at the KENRICK NURSERIES, IN NEWTON, an extensive assortment of Apples, Pears, Peaches, Plums, Cherries, Apricots, Nectarines, White Mulberries, Grape Vines, about 150 varieties of the most ornamental hardy trees

and shrubs-including nearly 50 superb varieties of hardy roses, comprising white and red moss—single yellow, double do—yellow Austrian—red and yellow Austrian—black mottled, sable, Tušcany, and other varieties of the blackest roses—Unique White Provence, &c.

Also, GREVILLE Roses, and WILMOT'S SUPERB STRAWBERRIES.

Apple Trees of extra sizes-also Flowering Horse Chestnuts, and some other sorts.

Written orders directed to John or William Ken-RICK, NEWTON, will he received by the daily mail, and promptly attended to-or they may be left at Mr Joseph Bridge's Grocery and Seed Store, No. 60, Court street, Boston, where, on application, catalogues will be delivered. gratis—or, catalogues may be obtained of Mr J. B. Russell, at the New England Farmer office.

New Vegetable.

Just received at the New England Farmer Seed Store, 52 North Market Street, a small quantity of SIR JUHN SINCLAIR'S NEW BEET, from London. This is presumed to be the first seed of this fine vegetable, ever brought into New England. For sale in papers of 12 1-2 cents each, or in larger quantities.

Cow for Sale.

BOSTON, FRIDAY, MAY 8, 1829.

COMMUNICATIONS

FOR THE NEW ENGLAND FARMER.

FOREIGN GRAPES IN THE OPEN GROUND.

MR EDITOR-Without entering into the question, whether any native grape is to be compared with the imported ones, upon which if I should state my opinion frankly, I should be charged with a want of patriotism, and after stating my own conviction, that the native grapes of the South excepting the Isabella, will be found to be in common years as tender as the European ones, I think I shall find all horticulturists agreeing with me in the opinion, that, if we could ripen the European grapes in the open air without walls or terraces it would be a great desideratum, and worth many exertions and sacrifices. In 22 years, I have obtained not more than 6 good crops of well ripened fruit, on a dry and warm soil.

Under the hope of attaining this desirable end, I published a translation of the Thomery practice of raising the hardy Chasselas blanc, (Sweet Water of our gardens as I believe.) The practice essentially consists in checking very severely the growth of the grape, and compelling it to bear in a small compass. Permit me now to add an English experiment founded on the same principle. I have this year prepared ground to try this ex- to your Society, which he has obligingly furnish- were our small Virginia blue grape, in size not I, page 43, and was written by R. A. Salisbury, F. R. S. L. S. H. S., &c. To those who are ignorant of Mr Salisbury's pretensions, it will be proper to say, that he is an eminent hotanist, and Society, I am your obedient servant, cultivator, and one of the highest attainments .-Premising that his situation was in one of the most cold, unfavorable climates, and in a barren soil, and that he has failed for years even in ripening the hardy Miller grape, in a ratio of more than 20 bunches in 2000, he proceeds to give the following history. "A Scots nobleman, who often visited the place, made the following remarks, When I was a young lad I remember eating ripe grapes from a vine in the open air, in Stirling, (north of Edinburgh) which was brought to ripen half its fruit in cold summers, and a whole crop in warmer ones, by the following treatment. On the 20th of September prune the vine as you would in December, taking off all the leaves and grapes, ripe and unripe, and shortening the shoots to 1, 2, or 3 eyes at most. In the following spring it will push its buds a few days earlier than any annually, and in the course of seven years you will determined me at once to make the experiment. er? be rewarded for your patience and expense with After scarching for proper slips, I found as many Is there any lateral or half a ripe crop in must summers, and a whole as I required. This was in the month of March it wholly perpendicular? one in warm summers.' Mr Salisbury adds, this in the year above stated, before any appearance of from the grapes.

Permit me to add, that though in Scotland it required seven years, yet in Yorkshire it took but five, and it is highly probable that with us, success would follow the next, or at farthest the third and inclosed the grafts completely, and covered or does some portion of them return to the roots? year, because Miller's burgundy, which Mr Salis- them in this way about four inches, leaving two * Blight, probably.

while the peach has lost its fruit, and the Ameri- exists in that neighborhood. can raspberry has perished, a delicate Chinese Ailanthus has not been injured.

Roxbury, April 28.

A FARMER.

FOR THE NEW ENGLAND FARMER.

ENGRAFTING GRAPE VINES.

To the Corresponding Sec'y of the Mass Hort, Society,

S1a-A few days past, in conversation with Brig. Gen. Armistead, on the cultivation of the trellis. In the month of March they were grapes, he mentioned his complete success in engrafted, the result of which is a growth of a grafting the foreign Sweet Water Grape on the grape never heretofore cultivated in our country, native American stocks, ten years past. I thought and as to flavor and size, superior to the importit very important, and requested a communication ed. in writing from him for the purpose of presenting periment rigorously and strictly. Of its fate, I ed me. A copy is inclosed. It is now rather larger than a buck shot, growing in bunches, and shall give fair notice. The article I refer to is late, still had I any native stocks, I should be in- averaging from one hundred to one hundred and published in Loudon's Gardener's Magazine, No. duced to adopt it -as with my own bad success fifty in each bunch, and differing from the Fox in the cultivation of foreign grapes, in open, airy, grape essentially. But I am of opinion that any and flat grounds, I should expect better success.

With every good wish for the success of the well. JOHN PRINCE.

Jamaica Plain, April 26, 1829.

JOHN Paince, Esq .- In answer to your note requesting me to state the success from grafting briefly state that it resulted in complete success .-ness for horticultural pursuits.

Arriving at my native place in 1819, I found our old family garden in a state of decay; and in the enclosure I found running several very luxuriant grape vines, while those of the former had was the only imported grape we had, (and those under the best culture when I knew them,) were Per. frequently failing. Seeing the far stretched vine and after going through the common process of in-

bury could never ripen, invariably succeeds with eyes exposed. The experiment proved the utility of thus preserving them from sun and air, for I have frequently expressed to my fellow culti- three out of four took, and on the head of the vators the conviction of the hazard of leaving the largest vine, I put two grafts, both of which sur-Isabella and other southern grapes exposed with vived, which made it equal as if all had taken.out covering through the winter. The last win- The result of the first year was, that the grafts avter, though far from severe, (probably owing rather aged a growth of from nine to twelve feet. The er to its mildness) has been fatal to foreign and second year they bore many bunches of grapes, pative grapes, even in Philadelphia, and to the The third year my mother wrote me that they had peach, and vine, in New Brunswick, New Jersey. gathered upwards of two barrels from my four With me it has destroyed the Cane Raspherry, vines. The succeeding years the neighborhood which had stood five winters of greater general was in part supplied, and from others following severity. Yet there are some anomalous facts, the example, no failure of fine fruit 1 believe,

I communicated the result of my experiment to Major Aplen, near Washington city, and I believe he has profited by it. The result was likewise communicated to Col Gaatiot, of the Engineers, and was successfully proved, even to rearing to great perfection the Portugal grape, such as we receive in jars, on the common Fox grape growing in our swan ps, the roots of which were taken up in the fall, and headed down, and planted along

The vines on which I made the experiment, of our native grape stocks would answer equally I am, dear sir, respectfully

Your obedient servant, W. R. ARMISTEAD.

Jamaica Plain, April 29, 1829.

P. S. The Portugal grape, raised by Col GRA-TIOT, was, I believe, laid down in winter, being supposed to be of too delicate a nature, to stand the Sweet Water grape on native stocks, I will the climate of Virginia. They produce better, and in no instance have I known the rot* to affect the The cause of the experiment originated in my fond- Sweet Water grape, engrafted on the native vine.

W. R. A.

FOR THE NEW ENGLAND PARMER.

Ma Fessenden-By request of the Lyceum in almost entirely disappeared. The Sweet Water this place, I send you the following questions, requesting you to give them an insertion in your pa-

What causes the circulation of sap? We know of our native soil climbing and regaling in rich that heat affects it, but how? What makes it vines pruned in winter. Pursue the same system luxuriance around the old paling of our garden, flow earlier in one kind of trees than in anoth-

Is there any lateral or oblique circulation, or is

What becomes of the sap in winter? Does it plan was immediately adopted by him, and five the flow of the sap. I picked out four native retire to the roots or remain in the tree? As it years afterwards some excellent wine was made vines, and headed them down as low as the turf, appears that a greater portion of the carbon contained in the sap is converted into the substance serting the graft, I bound them with woollen yarn, of the tree, than of the other constituent princiand covered them with proper grafting clay; and ples, what becomes of the remaining oxygen and to make the process doubly sure, I cut large sods hydrogen? Are they all thrown off by the leaves

Is the circulation of sap permanent during the warm season or not?

Doctor Waterhouse asserts that for a fortnight about midsummer, vegetation in trees is at a stand. Is this true? If so, what is the cause? Why does the wind have so much influence on the running of sap?

Why is it necessary that it should thaw in the day and freeze in the night, in order that maple sap should run well?

Why do those plants called evergreens, remain

green through the winter?

Is there a difference between the power of conducting heat possessed by different trees? If so, which are the best conductors? Is there any correspondence between the solidity of the wood and the conducting power? Does this affect the running of the sap?

We should be glad to see an answer to any or all of these questions. They have given rise to several theories widely different from each other, and in regard to some of them we can hardly find data, on which to form a theory.

Respectfully yours, R. A. COFFIN, Secretary. Ashfield, April 23, 1829.

FOR THE NEW ENGLAND FARMER.

POTATOES.

Ma Fessenden-I often see much in your very useful paper on potatoes. I will add a few remarks, after more than twenty years experience state of the ground." in farming, having cultivated, some seasons, more than a dozen sorts, and never less than five or six. I fully agree with Mr Lowell on the subject of the sorts never mixing, from being planted near each other. I have occasionally seen red and white potatoes in the same hill, but perfectly distinct; having accidentally planted a set of each, always having intended, however, to plant by themselves, but carelessness sometimes takes place. New sorts or mixtures, I presume, are never produced, only by sowing the seeds contained in the apple and in the blossom.

As to planting whole potatoes, or cutting in halves, or quarters, if large, I have not perceived any difference in the crop. I rather imagine that too much seed may be planted, as often as too little. Why do we want more stocks for a hill than we do of corn, say four or five? I believe beyond that number is unnecessary and prejudicial. In Ireland it is often practised by the lower class of farmers, and more especially in scarce seasons, during the winter to scoop out the eyes (as they inform me about three-fourths of an inch in diameter, and one-eighth thick) every day before cooking the rest of the roots. These pieces are saved till planting, the outsides become dry and do not rot as soon as planted, as many pieces do when planted immediately after being cut. I think it always well, two or three weeks before planting to cut the potatoes intended for seed, that they may get dry-or if put off until the day of planting, I would then recommend, that plaster of Paris, or lime, should be sprinkled over them so as to cover and dry up the moisture before dropping in the hills or rows.

I have sometimes, to obtain early potatoes, adopted the plan recommended by Mr Derby, of Salem, of putting whole potatoes close together in ishment or a substitute for manure for the young nearly as remarkable as in those above related.a hotbed, and covering them, say one or two inches, when the sprouts get five or six inches

above ground, take up the roots and break off the the seed potatoes, for the reasons assigned above sprouts close to the potato. These shoots, have by Mr Knight, and because early varieties bave roots like a cabbage plant, and may be planted three or four in a hill, or if in rows nine to twelve inches apart-they produced potatoes very equal in size, and generally large. I think this proves they do not require any further nourishment from the old potato, as Mr Derby has returned the same potatoes to the hotbed, and taken fresh shoots from them four, and I believe, five times.

Yours, &c. NORFOLK.

Remarks by the Editor .- The following observations on some controverted points connected with the best mode of propagating potatoes, are ion of Mr Loudon, who says "tolerable sized cutfrom writers of high authority, and appear to us tings of pretty large potatoes with two or three to be such as the exercise of our reasoning faculties would lead us to assent to, if they had been derived from sources of less respectability. They may, perhaps, serve as an useful appendix to the of whole potatoes as sets. The best cultivators in remarks of our correspondent above.

Loudon says "In default of genuine early sorts; of kidney potatoes the root or mealy end as havor, to save the tubers for use in seasons of scarcity, the sprouts which are generally found on store potatoes in spring, and picked off and thrown three buds on each set, though one is considered as away as useless, will, when carefully planted in sufficient." There are, however, very respectable loose well prepared soil, yield a crop, and this authorities in favor of whole potatocs besides that crop will be fit for use a little sooner than tubers, in of the Memoirs of the N.Y. Board of Agric. quoted p. which the buds are not advanced. Almost every- 318 of the current vol. of the N. E. Farmer. The thing, however, depends on the fine tilth, and good Hon. Josiah Quincy, in a letter to the Correspond-

cuttings of the roots. Mr Loudon asserts that this which, by accident, was planted in part with cut making the sets or sections, reject the extreme or watery end of the tuber, as apt to run too much to haulm, and having the eyes small, and in a closter; reject also the root or dry end, as more likely to be tardy in growth, and produce the carl. Then divide the middle of the potato, so as not to have more than one good eye in each set .-Where the potato scoop is used take care to apply it so as the eve or bud may be in the centre of each set which this instrument produces of a semi-globular form. The larger the portion of tuber left to each eye, so much the greater will be the cut." progress of the young plant. The scoop is only to be used in seasons of scarcity, when the portion of tuber saved by it may be used for soups for the poor, or for feeding cattle.

" Size of the sets or cuttings. Knight has found that for a late crop small sets may be used hecause the plants of late varieties always acquire a considerable age before they begin to generate tubers; but for an early crop he recommends the largest tubers and he has found that these not only uniformly afford very strong plants, but also such as readily recover when injured by frost: for being fed by a copious reservoir beneath the soil, a reproduction of vigorous stems and foliage, soon takes place when those first produced are destroved by frost, or other cause."

The apparent clashing of authorities and opinions, with regard to this subject, may, perhaps, in some measure, he reconciled by taking into consideration the following circumstances.

- 1. The poorer the soil the greater the quantity of seed necessary, because the seed serves as nourplants in a poor soil.

less time to obtain nourishment from the soil than those which come to maturity late in the season.

- 3. Sprouts, shoots, or portions scooped out together with the eyes of potatoes, will answer in times of scarcity, but require a richer soil and a longer time to grow in than if whole potatoes or large cuttings were used.
- 4. If unripe potatocs are best for seed, as some assert, the smallness of such potatoes can be no objection to their use.

As respects cutting seed potatoes, or planting them whole, we have conflicting authorities enough to fill a volume. But we are inclined to the opingood eyes or buds in each are probably to he preferred. Independent of the increased expense of the seed, it is never a good practice to make use Ireland and Scotland invariably cut the largest Potatoes may be propagated from sprouts or shoots. and best potatoes into sets, rejecting in the case ing no bud, and the top or watery end as having too many. No objection is made to two or even ing Secretary of the Mass. Agr. Soc. published in Potatoes may be propagated by sets, sections or their Repository, vol. v. p. 64, mentions a field, is the only method fit for general purposes. "In potatoes, and in part with whole potatoes. The result was, that "in the whole course of vegetation, the whole potatoes had a decided superiority over every other part of the field, in the vigor and size of the tops; and, at harvest, in comparing those rows with the adjoining rows, the product of the rows planted whole exceeded an equal extent of the adjoining rows, planted with cut potatoes, more than one third. There was nothing in the cultivation, or state of the land, which could produce this difference, except the circumstance of the one having been planted whole and the other

We might quote many authorities on the other side of the question, but we shall refer to but one at present. A communication on this subject was published in the New England Farmer, vol. iv. p. 314, with the signature J. W. The writer of this we know to be an upright, intelligent, and scientific cultivator. He stated that "On the 3d of May, 1825, I selected twenty good handsome potatoes, as near of a size as possible, ten of which I planted whole in ten hills-the other ten 1 cut into 4 pieces each and planted in ten hills, in a parallel row with the other, four pieces in each hill. On the 28th of September I dug the potatoes and weighed the produce of each row by itself. The row in which the ten whole potatoes were planted weighed 46 pounds 12 ounces-and the row that was cut into quarters produced 77 pounds 4 oz. rows were contiguous to each other, and the soil exactly the same. No manure was used. The diversity of the result of other experiments for the purpose of ascertaining whether cut or whole potatoes should be preferred in planting has been We should be much gratified if some of our cor-2. The earlier the variety the larger should be respondents would give us their sentiments on the

cause of this variation; and tell us when, and under what circumstances cut, or whole seed potatoes are to be preferred.

While on this subject we will give the directions of Mr Knight, relative to the position in which the seed potato should be placed in planting. He says " When the planter is anxious to obtain a crop within the least possible time, he will find the position in which the tubers are placed to vegetate, by no means a matter of indifference; for these being shoots or branches, which have grown thick instead of elongating, retain the disposition of branches to propel the sap to their leading buds, or points most distant from the stems of the plants of which they once formed parts. If the tubers be placed with their leading buds upwards, a few very strong and very early shoots will spring from them; but if their position be reversed, many weaker and later shoots will be produced; and not only the earliness, but the quality of the produce in size, will be much affected."-Hort. Trans. lv. p. 448.

From the New Hampshire Statesman.

MERRIMACK AGRICULTURAL SOCIETY. At a meeting of the Board of Directors of the Merrimack Agricultural Society, holden at the Phænix Hotel, in Concord, on Thursday, the 9th of April, A D. 1829; the following gentlemen

were appointed a viewing Committee on Farms,

Thomas H. Pettingill, Salisbury,

Chairman. Joseph M. Harper, Canterbury, Joshua Lane, Chichester, Jeremiah H. Wilkins, Pembroke,

Jeremiah Pecker, Concord, Simeon B. Little, Boscawen, Charles Stinson, Dunbarton.

Voted, That the next annual meeting be holden at Hopkinton Village, on Wednesday the 7th day of October next, at 10 o'clock in the forenoon.

Voted, That no quantity of land less than twenty-five acres shall receive a premium as a I farm.

Voted, to dispense with ploughing matches. Voted, That the following premiums be offered, to be awarded at the next annual meeting, viz:

On Farms.

On the best farm \$10, and one year's subscription of the N. E. Farmer.

On the next best do \$8, and one year's do do On the next best do \$6, and one year's do do On the next best do \$4, and one year's do do On the best kitchen garden, \$3, and one year's do do

On the next best do, \$2, and one year's do do Voted, To appropriate the sum of twenty-five dollars to be awarded on crops and improvements in the art of husbandry, including reclaimed meadows and the cultivation of the mulberry tree; which sum is to be at the disposal of the viewing Committee.

MASSACHUSETTS HORTICULTURAL SO-CIETY.

PREMIUMS ON TREES AND FRUITS.

The Committee who have in charge whatever relates to the multiplication of fruit trees, fruit, &c.—the recommending of objects for premiums, and the awarding of them, have attended to that duty, and submit the following report.

1st-On Nurseries.

For the hest nursery of apple trees of the most approved kinds of fruit, not less than one thousand in number, and not less than two years old from the budding or grafting,

For the best nursery of pear trees of the most rare and approved varieties, not less than one thousand in number, and not less than two years old from the budding or engrafting, a premium of

For the best nursery of peach trees of the greatest variety of the best kinds, not less than two thousand in number, a premium of

For the best nursery of cherry trees, not less than five hundred, and not less than two years old, and of the best kinds, a premium of

For the best nursery of plum and apricot trees of approved varieties, not less than three hundred in number, a premium of

For the best apples, not less than two doz. a premium of

For the best pears, not less than one doz. a premium of

For the best peaches, not less than one doz., a premium of

For the best plums, not less than one doz. a premium of

For the best apricots, not less than one doz., a premium of

For the best foreign grapes, not less than three bunches, a premium of

For the best native grapes, not less than

six bunches, a premium of For the best gooseberries, not less than one

quart, a premium of

For the best strawberries, not less than one

quart, a premium of 2

3d-On the culture and management of fruit trees,
and the diseases incident to them.

To the person who shall offer to the Society at their annual meeting in Sept, the best treatise, in manuscript, on the cultivation and management of fruit trees, a premium of

To the person who shall offer to the Society, at their annual meeting in Sept., the best treatise, in manuscript, on any one, or more, of the insects that attack fruit trees, with the best method of preventing or destroying the same, a premium of

To the person who shall offer to the Society, at their annual meeting in Sept., the best treatise, in manuscript, on any one, or more, of the discases to which fruit trees are liable, with the best method of preventing the same, a premium of

4th-New Varieties.

To the person who shall introduce and propagate the greatest number of the new and most approved varieties of fruit trees, a premium of

The times and places for exhibiting the various kinds of fruit, to be fixed by the Committee, and branches over much ground. They first appearpublished.

Discretionary premiums to be awarded on fruits presented by members, or others, when rare and of excellent sorts.

All which is respectfully submitted, by order of the Committee.

E. PHINNEY, Chairman.

FOR THE NEW ENGLAND FARMER.

INSECTS.

MR FESSENDEN—Among the many tribes of insects, which devour the vegetable products of the farmer, that numerous species commonly called rose bugs, are, at present, the most alarments, in one ing.

In the year 1825, the writer began his observations and experiments on these destructive insects, not expecting any pecuniary renuneration whatever, but with a view to satisfy himself as to their habits and economy, hoping in the course of the investigation to find some effectual mode of destruction, or at least, some efficacious antidote. He was prompted to this course by the great injury they had done him. He had no previous opinions to support; but expected to learn their economy by a close examination of all their movements. He was unacquainted with any system of Entomology, except that of Linnæus, and with that imperfectly. He had merely learned by turning over a few pages of the Encyclopedia, then publishing in Philadelphia, that there were new arrangements, new divisions, and new names: but he had no leisure time to acquaint himself with the different systems. He had not seen any specific name of the rose bug. He suspected that it was an American insect, probably not described by any foreign Entomologist. It was first known 3 by its ravages on the rose; and on this account had received its common name. And from obser-3 vation, it had a manifest preference for that flower, above every other vegetable production, destroying every variety within his knowledge. Under all these circumstances, he called the insect SCARABŒUS roseus, a name, which then answered his purpose, the specific name being founded (as 2 was apprehended) on one of its peculiar hab-

It now appears, however, that the insect has been described by several Entomologists, each giving a different specific name, some founding it on a prominent habit, and others on anatomical structure. Fabricius first described the insect in question, and called it Melolontha subspinosa, which specific name has the precedence, and ought to be retained. The modern genus, Melolontha is included in the Scarabeus, of Linneus, the parent of the science.

But, neither the name, nor the history so much concerns us, as to know in what manner we can prevent their depredations. As to the caterpillar and some others, we have the mode of destruction clearly pointed; not so with the rose bug.—Should they increase from year to year (and we see nothing to prevent, except the powerful operation of some natural cause, now unknown to us.) they will in time not far distant, sweep all before them.

They, in 1828, destroyed much fruit, and stripped my grape vines, one of which (a great hearer 10 ten years ago) measures eight inches in cir-

cumference, 16 feet from the root, and spreads its branches over much ground. They first appeared on the 10th of June, and increased until the 20th, at which time they were very numerous; but from this time, decreased, and but comparatively few were seen after the 2d of July—very few after the 10th, and none was observed after the 23d. Ten quarts, by measure, were caught, mostly on rose bushes.

Neither the mutilated roses, foliage of plants, nor damaged fruit should be immediately removed, as these insects prefer such, to that which is sound and unhurt. They will collect round a mutilated rose in prodigious numbers, and may be easily caught.

It seems necessary, in order to concentrate our efforts, in one common cause, against our numerous enemies, that investigations and experiments should be made known. An experiment, fairly conducted, whether successful or not will have its use. If successful, it is of great importance, if unsuccessful, it will prevent a repetition, and may lead to one of more efficacy.

Fifteen grains of corrosive sublimate dissolved in two ounces of spirit and added to one quart of water, with a little gum arabic, and applied with a brush to young fruit, peaches, &c. was not found effectual against the rose bugs; but it destroyed both fruit and foliage. The same solution applied to young cucumbers did not prevent the yellow hugs from injuring them, neither did it appear to injure the plants.

A strong decoction of wormwood (artemesia absinthium) with a fine powder of colomba-root (a very bitter substance) and a little gum arabic, to make it adhesive, applied to fruit and young cucumbers, was not effectual against the insects.

The best antidote against the rose bug, and the small yellow bug, that has yet come under my inspection is slacked lime applied with a dredging box, while the fruits or plants are wet with dew. If the fruit or plants be wet with a weak solution of gunu arabic, previously to the application of the lime, it will remain on them much longer, and no injury will be sustained by it. If applied to young cucumher plants, the seed leaves must be carefully turned up, wet, and the lime applied as aforesaid. The lime used had been nicely slacked with a little water, one year, for the purposes of the garden. Perhaps, it would be equally well, if slacked immediately before its application.

It was found, that, if rose longs, while ou plants, be thoroughly wer with very strong soap suds, (one gill of strong soft soap to one quart of water) they soon die. This strength did not injure the plants on which it was tried. This experiment was made when the bugs were on the decline, and whether the mixture would have the same effect in the beginning of their race, while in their turnost vigor, or prevent them from preying ou plants wet with it, further experiments may determine. It is needless to say anything in this paper, as to the fertilizing power of this application, or that of lime.

In strong soap sads (one gill of soap and two quarts of water) rose lugs will die in a short time, and this mixture supersedes the necessity of scalding them, as is the case when caught in simple water.

R. GREEN.

Mansfield, February 6th, 1828.

From the Salem Gazette.

SILK-WHITE MULBERRY TREES.

The importance of introducing the cultivation of the White Mulberry Tree, a measure preparatory to the extensive introduction of silk, in this country may be inferred from the following facts, extracted from the report of the Committee on Agriculture in the United States House of Representatives, May 2d, 1826.

A statement of the value of Silk Goods imported more than was exported, contrasted with the value of bread stuffs exported in the years 1824 and 1825.

Silk imp'd more than exp'd. B stuff exp'd. Years. \$6,799,246 \$5,387,019 1824 5,417,997 7,705,785 1825

An importation for home consumption of more than seven and a half millions of dollars in Silk, an expertation of less than five and a half millions of dollars in Bread stuffs! The facts speak the Importance of the subject, and indicate the necessity that exists of awakening the slumbering agricultural resources of our country, by the introduction of new and profitable articles of production. That our farmers may cultivate mulberry trees and engage in the production of silk with a fair prospect of profit, is rendered highly probable from the following calculation, made by John Fitch, Esq. of Mansfield, Con. where the business has been carried on for several years to a considerable extent.

One acre of full grown trees, set one and a half rods apart, will produce forty pounds of manufactured sewing silk.

The labor may be estimated as follows:-For the three first weeks after the worms are hatched, one woman, or children who would be equal to such a person.

For the next twelve or fourteen days, 5 hands, or an equivalent number of children. In this period two men with other help would be employed to better advantage than all women and children. This finishes with the worms.

For plucking off the balls, reeling the silk, &c. it requires about the same amount of labor for the same length of time as the last mentioned period, which may all be performed by women and children. The aforesaid labor and board may be estimated at Spinning.

40 lbs. of silk at 5 dolls per lb.

Net profit per acre, To prepare, therefore, for the production of silk, it is desirable that White Mulbery Trees should be immediately cultivated in all parts of our country. The wood produced by their growth will pay well for the expense of cultivating, should our farmers never find it for their interest to make any other use of them.

\$86

Hints on the management of the Mulberry Tree.

All practical writers agree that the proper soils for the mulberry tree are dry, sandy, or stony .- field. Gen. Salem Town, Charlton. Ebenezer The nurscries as well as large or small mulberry Estabrook, Holden. Jacob Fisher, Lancaster .plantations, require a sunny exposure, spots well Isaac Southgate, Leicester. Bezaleel Laurence, cheltered from strong and cold winds. There is Leominster. William S. Hastings, Mendon.considerable difference in the quality of these Samuel Waters, Millbury. Adolphus Spring, trees. They are directions, that is, some trees are Northbridge. Col Samuel Mixter, New Braintree. male or harren, some female, or fruit-hearing.— Col William Eager, Northborough. Col Jacob Pho male produce the most leaves and are consid- W. Watson, Princeton. Nymphas Pratt, Shrews- pose.

worms than the female.

The value of a nursery of trees therefore, raisby grafting.

ry trees. 1st from the seed; 2d from roots; 3d from layers, and 4th from cuttings. The 1st and 4th can at present he alone generally resorted to ton. Stephen G. Gardner, Bolton. Nathan Howe, in this country. An ounce of good well cleaned Shrewsbury. Eli Warren, Upton. seed, well managed will probably produce ten or twelve theusand plants. It should be sowed to-wards the last of April. The ground being properly prepared by previous ploughing, or digging and manuring, is to be cleaned, levelled, and divided into beds of four or five fect in width,-Drills from six to ten inches asunder and from one to two inches deep must then be made by a line. The seed may be sown in these drills dry, or having been steeped two days in water, rub it on packthread to which it will adhere, and lay the thread in the bottom of the drill and cover it with the earth. In two or three weeks, if kept moist, the young plants will appear. Keep the beds clear of weeds. On the approach of winter it application. The Mechanical Powers, viz. Levmay be well to cover them with leaves. If the ers, Pulleys, Wheel and Axle, Screw, Wedge, Inseedlings grow the first season to the height of clined Plane, Hydrostatic Bellows, and Syphonone foot or more, take them up in the spring following, cut the top so as to leave about three inches above ground, cut off the lower part of the root and set them in nurseries in rows like other fruit trees, where the following spring they may or may not be grafted, pruned, and cultivated until they become sufficiently large to set in Hedges or Plantations. Cuttings should be taken from perpendicular shoots, and particularly from those which terminate branches. They should be of the last summer's growth, and from six to fifteen inches in length. Plant them in shady borders, early in the spring, about two-thirds their length in the ground; close the earth well about them, and in dry weather let them he watered. After a year they may be transplanted in open nursery rows if well rooted.

WORCESTER AGRICULTURAL SOCIETY.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 8, 1829.

Apparatus for Lyceums, &c .- Mr Holbrook, who has for several years been successfully and assiduonsly engaged in organising and carrying into effect those useful and popular seminaries of science denominated Lyceums, has devised, collected, and advertised the following among other articles of apparatus for these institutions. A set of Geometrical Solids and Diagrams, with a small Manual to aid teachers, and their pupils in their A representation of the Solar System, Instruments for Tides, Eclipses, and Changes of Seasons, &c. A Pneumatic Cistern, Lamp Stand, and various other articles as they may be ordered. Air Pumps, Electrical, and Galvanic Apparatus, Geological Specimens, &c. &c. Remittances and orders for the above and similar articles, to be directed to Josiah Helhreek, Busten.

Gypsum .- A paper printed at Middlebury, Vt, states that great quantities of gypsum, or Plaster of Paris, bave been found in the country west of lake Champlain, and east of the upper part of the Hudson river.

Chimney Sweepers .- The government of Great Britain, in order to abolish as far as possible the practice of employing boys to clear out chimneys, has issued an order that in future the flues of all the Royal Palaces, public offices, &c. &c. shall be cleansed by the use of machinery, invented by a Mr Glass.

Infusion of Walnut Leaves to destroy Insects .- It appears by a late communication to the London Horticultural Society, by Sir Charles M. L. Monck, Bart, that worms which infested plants in pots were destroyed by a pint of an infusion of walnut leaves given to each pot. The worms quickly emerged from the mould to the surface, and were removed. This treatment was repeated in the following week, when a few more worms were extracted; the plants which had been sickly, after this application resumed their health and blossomed strongly. This success induced Sir Charles to try the experiment on orange trees, and other plants in pots, and it was attended with equal success. He thinks that the infusion is beneficial, not only in destroying the worms, but that it acts also as a manure. The infusion is made by pouring hoiling water on fresh walnut leaves; which baving stood till cold, is ready for use.

Forsyth recommends a decoction of walnut leaves as an antidete to insects, and a decoction of FOR THE NEW ENGLAND FARMER.

SEA KALE-ITS CULTURE.

MR RUSSELL-Although I have distributed sea kale seed for 15 years yet there is an universal complaint of its failure. The cause is, that it is sown too late. It drops its seeds in August, and where they are then buried, they never fail of growing. I send you some seedlings of last year, to be distributed to the curious, say 3 or 4 roots to each. To a root, a crown is necessary-the crown is'known by its foliage just starting-each crown will in good land furnish 4 at least next fall-and twelve stools or grown plants are enough for one family, as each will give from half a peck to a peck of eatable matter, and their duration fit for table does not exceed a fortnight.

> Yours, &c. J. L.

INDIAN CORN.

Roxbury, April 30.

Seed corn is commonly soaked before planting for two purposes, to preserve it from birds and insects, and to quicken its growth. In many cases dry. There is danger in soaking the seed too much, especially if it be planted early in the season, as it sometimes causes the corn to rot in the ground. But if planting a second time should become necessary, in consequence of the destruction of the seed first planted, or if planting be delayed till the beginning of June it will be proper that the seed should have boiling water poured upon it. Let it not soak more than a half a minute, and be cooled speedily, and be planted before it dries .-The corn will be forwarded in its growth by several days. The seed should be covered with about two inches of earth.*

Jesse Buel, Esq. of Albany, observes that " Failures, and great inconvenience and loss often result from the seed not vegetating from its destruction by the wire worm and grub, and from the depredations committed upon the young plants by birds and squirrels. As I have never suffered in either of these respects, I will state my method of preparing the seed. I collect, in the first place, a quantity of the roots of the black hellebore, or itch weed, which abounds in swamps, grows with, and resembles in its habits, skunk's cabbage, except that the leaves are narrower, longer, and grow upon the seed stock: these I boil till I obtain a strong decoction. I then take out the roots, and add to the liquor salt petre, in the proportion of four ounces to three gallons, and put in my seed corn while the liquor is yet warm. Thirty-six hours is the longest period it should be suffered to steep, as the nitre may destroy the vegetating principle of the grain. As a further precaution, the liquor is again warmed, and a gill of tar stirred in, and the seed immersed in it anew. Thus prepared I have not lost twenty hills in four years. The germinating process commences before the corn is planted, and unless the growind is too wet to grow the crop, (and it never pays the expense of culture on soils that abound in springs, or that are naturally wet and cold,) it will continue to progress. The hellebore is poisonous, and though the ground may partially extract the poison, neither birds nor squirrels will ever disturb a dozen hills. The tar impregnates the seed and protects it from the worms. The nitre and plaster, with

* Deane's N. E. Farmer.

which latter the seed is mixed before planting, the fingers until the potatoes made their appearcombine their fertilizing properties to give vigor and strength to the young plants."

Soaking seed corn in a solution of Glauber's salts has been recommended as a preservative against insects and birds, and such solution has likewise been thought to be valuable for its stimulating and fertilizing qualities. (See New England sand, with old manure. The vegetation is hasten-Farmer, vol. v. page 316.) Copperas dissolved in water has likewise been highly recommended as a steep for seed corn. A writer for the N. E. Farmer (see vol iv. p. 284) states that he "used about one and a half pounds of copperas in three last year, and my potato vines did not show thempecks of corn. I made the water warm, and selves for more than four weeks after planting."soaked the corn full 48 hours before planting, put- Taunton Advocate. ting in copperas as we used it out. It is not easy to use too much copperas. I believe the more the better." See likewise N. E. Farmer, vol vi. p. 358. This preparation for seed corn has been much used, and, so far as we have learned, Journal—Freedom of trade and settlement in In-

A writer in the Richmond Enquirer, with the signature Agricultor, says "I now from a small the soaking of seed corn is, no doubt, of great spot of poor ground, raise the greatest profusion of utility, but sometimes it is thought best to plant it melons, whereas, until lately, I could not raise enough on four or five times the same space of rich land. I dig square holes ten feet apart, each way, for watermelons, and about six feet for musk melons; for the first, two feet deep, for the last, eighteen inches deep, and eighteen inches wide. The roots run but a short distance in a horizontal direction, but striking deep into the earth, they are secure from the effects of drought; and by filling the holes half full of manure, and finishing them to a few inches above the surface with a mixture of manure and soil, or which is better, a composition of vegetables, and other substances, commonly to be met with around out houses and pig pens, a depth of soil, of fine and light tilth is formed. I have not attempted to raise pumpkins in this way, but have no doubt that it will answer for them,"

The same plan may be adopted with advantage and economy, as to manure, in raising Lima beans, especially in cold situations .- Penn. Agric. Almanack,

SWEET POTATOES.

We publish the following account of the method of cultivating this vegetable, which we derived from a source that may be relied on. We have no doubt that it would be a profitable crop for our farmers to raise on a large scale. The yield is equal to that of the common potato, and the price is more than double.

It is not to be expected, however, that our farmers will commence the cultivation on a large scale, until they have made an experiment upon a small

" I raised the last scason a bushel and a half of sweet potatoes from thirty hills-an average lot of them were exhibited at the Cattle Show in Mansfield. They were from six to eight inches in circumference, and from six to twelve inches long. I planted them in hills, which were about the size of a bushel basket, and made as near together as the soil would permit; so that the bases of the hills nearly touched each other. The slips were cut in two, and three pieces were put in each hill, about eight inches apart, and covered an inch or so with the earth.

planting was merely pulling up the weeds with Farmer.

ance. The vine grows with great rapidity, and soon covers the hills, so that no further attention is necessarv.

The best soil for the potato is a light sandy loam, manured with compost, spread and ploughed in; or a soil composed of swamp mud and ed by cutting the slips. I have no doubt that it would be still better, where it is intended to plant but twenty or thirty hills, to start the slips under a glass frame. It was a very backward spring

Edinburgh Review .- The 96th number of this periodical, republished by Wells & Lilly, contains articles on the following subjects.

Lockbart's Life of Burns-Bishop Heber's dia-Recovery of Lost Writings-Papyri, Ancient Tachygraphy, Palimpsests-American Tariff-Police of the Metropolis (London)-Causes and Prevention of Crime-Northwest Passage-Expeditions to the Polar Sea-Importation of Foreign Wool-State of the Woollen Manufacture-Bentham's Rationale of Evidence-Shuttleworth's Sermon-Religious and Temporal Knowledge.

Seed Corn .- It is of the utmnst importance tothe farmer to secure the first blades of corn that shoot forth, in order to obtain stalks whose fruit shall come to maturity. The experiment has been tried with success, of soaking the corn before planting it, in a solution of Glauber's Salts. Seed that had been thus prepared was planted by the side of some of the same quality which had not been soaked. The result was that the soaked seed came up three or four days before the other, and remained uninjured by worms or birds, while one half of the other was destroyed. The expense of thus leaching the seed is a mere trifle, and we wish that some of our agricultural friends would make the experiment, that its utility may be further tested .- Lowell Journal.

Sea Kale .- This garden vegetable is not generally known in this country, but is likely to become an object of cultivation in various places .-The following resolution in relation to it, was adopted by the Pennsylvania Horticultural Society, at a stated meeting held on the 6th ult:

"That a premium of ten dollars, or a gold medal of that value, be awarded to the person who shall bring to the Philadelphia market, in the year 1831, the greatest quantity (not less than 12 bunches of one pound each) and best quality of Sea Kalc, properly bleached,"

Mr Joseph Brown, a mason in Boston, has invented a cement for the ontside of buildings, which is a very good imitation of marble. It is said to resist moisture, smoke, and severity of climate. In the interior of houses it precludes the necessity of oil painting, as it bears washing as well as the natural marble. We have seen several houses covered with this cement; and we think a stranger might easily be deceived by the beauty of its appearance .- Mass. Journal.

Great Ox .- An ox was driven into this town last week, which weighed when alive, 1828 lbs. and 1247 lbs. when dressed. We understand it was All the attention which was paid to them after raised by Capt. Weymouth, of Belmont .- Maine

Cure for Musquito Bites .- The time has not yet arrived for the sensation of "personal wrongs" inflicted by those little reprobates, the Musquitoes. There is a remedy, and for fear we might forget it, we give it in advance, recommending to the reader to have this paragraph framed and hung over his mantle piece. Put a little ammonia on the bite, and you will be instantly out of trouble. We charge no fee for this prescription .- N. Y. M.

MASSACHUSETTS HORTICULTURAL SOCIETY.

We have received the past week, from Mr RoB-ERT MANNING, of Salem, as a donation to the Library of this Society, the following works.

A Treatise on the Culture and Management of Fruit Trees; in which a new method of Training is fully described. With observations on the Diseases, Defects and Injuries of Fruit and Forest Trees; and an account of a particular method of Cure, made public by order of the British Government. By Wm Forsyth, - with notes adapting the Rules to the Climates and Seasons of the Unitéd States, by Wm Cobbett.

New Improvements of Planting and Gardening, both philosophical and practical, explaining the Motion of the Sap and Generation of the Plants, &c. &c. By Richard Bradley, Fellow of the

Royal Society.

The Clergyman's Recreation, showing the Pleasure and Profit of the Art of Gardening. By John Lawrence, A. M. (a rare work, with plates, edition of 1716.)

An Introduction to the Knowledge and Practice of Gardening. By Charles Marshall, with notes by Dr Anderson, in 2 volumes.

Vinetum Britannicum, or a Treatise on Cider, and other Wines and Drinks extracted from fruits growing in this kingdom; with the method of price 37 1-2 cts. propagating all sorts of Frui. Trees. With a Discourse on the best way of Improving Bees. By J. Worlidge. (a rare copy, with plates, edition of 1691, Loudon.)

NOTICE.

By the management of appares, with the cess memor of the Bee Moth. By James Thacher, M. D.—price 75 cts.

Also, one copy of each of the following rare works:—
Columbia's Treatise on Husbandry and Trees—with illustrations from Pliny, Varro, Palladius, and other ancient and produce artistics of the second produce artistics of the second produce artistics.

The Standing Committee of the Massachusetts Horticultural Society, on the Culture and Products of the Kitchen Garden, are requested to meet at the office of the New England Farmer, on Saturday, 9th inst, at 11 o'clock, A. M.

Per order of J. TIDD. Chairman.

A Farm on a Lease.

Farm for Sale

In the town of Scituate, 18 miles from Boston, and the same from Plymouth. It is pleasantly situated on the Mail road.— Contains about 30 acres of good land, partly wood—a two story House, and out buildings, and will be sold at the low price of \$1200, if applied for soon. More land can be had in the in-nediate vicinity, if wanted. Apply to John Collanore, Esq. ear the premises, or the subscriber in Pembroke. a24 3t HORAUE COLLAMORE.

Red and White Clover Seed.

For sale at the New England Farmer Seed Store, No.

52 North Market Street, 5000 lbs. Red Clover Seed,

500 lbs. Dutch White Haneysuckle Clover, (imported.) Also, Herd's Grass, Red Top, Orchard Grass, Lucerne, Foul Meadow, Hemp and Flax Seed, &c, &c. March 27

French Grapes.

A few bundles first quality Vines, for sale at COPELAND'S POWDER STORE, 65 Broad St.
Also POWDER, SHOT, BALLS, FLINTS, &c., as usual,

at wholesale and retail, on the most favorable terms. April 17

Mangel Wurtzel, Sugar Beet, &c.

For sale at the Seed Store connected with the New England Farmer, 52 North Market street, 200 lbs. Mangel Wurtzel.

200 lbs. French Sugar Beet, raised expressly for this establishment, by John Prince, Esq. Raxbury.-The superiority of this seed and the excellence of the roots for cattle are too well known to need comment.

Also, roots of the Pie Plant, or Tart Rhubarb, in fine order for transplanting,-25 ets per root. Double and Single Dahlias, from 25 ets to one dollar each. The colors and form of this flower are magnificent, and are of the easiest culture, requiring the poorest suil, in which they bloom in the highest perfection. The ruots are tuberous, resembling a sweet potato-can be packed for transportation to any part of the union.

Also, Double Tuberoses, Tiger Flowers, Amaryllises, Formossissima, &c., beautiful bulbs now in season to

Also, White Mulberry Seed, 50 cts per ounce, Lucerne, or French Clover, White and Red Clover, Sanfoin, Titoothy, Orchard Grass, Oat Grass, Herds Grass, &c.

Also, several varieties of field coin, viz. the Early Golden Sioux, Gilman, Red, Turkey Wheat, Early Jefferson, (for the table) Swect, or Sugar (for the table.)

The Appalusia Melon-a new variety from Illinois, introduced by Doct. Green.—This melon was originally derived from the western Indians, by E. Warren. Esq. -is in eating from the 1st of September to the 1st of Noveniber-melons small, remarkably sweet, with red flesh, and a very thin rind—25 cts per ounce.

Also, the Apple Sceded Melon, a very early variety.

The Star Melon, a very late variety, of the Nutmeg

Agricultural Books.

The third edition of Fessenden's New American Gardener; this work has been pronounced by the most ju-dicious horticulturists in New England and the middle states, to be the hest treatise on Fruit Trees, Vegetables, Grape Vines, &c., to be found in this country-price

The Vine Dresser's Theoretical and Practical Manual, on the Culture of the Vine; and Making Wine, Brandy, and Vinegar. By Thiebaut de Berneaud.

The Young Gardener's Assistant, containing Directions for the cultivation of Culinary Vegetables, and Ornamental Flowers. By T. Bridgeman, gardener, New York-

A practical Treatise on the Management of Bees; and the Management of Apiaries, with the best method of des-

and modern authors, (a fine copy, London quarto edition, price four dollars.

Phythologia, or the Philosophy of Agriculture and Gardening: with the theory of Draining Morasses, and with an improved construction of the drill plough. By Dr Darwin, (Dublin edition, price three dollars and fifty ets.)

Darwin's Botanic Garden-(price three dollars, a fine,

correct copy.

The Horticultural Repository, containing Delineations of the best varieties of the different species of English Fruits; with delineations of its blossoms and leaves, in those instances in which they are considered necessary, with descriptions and colored drawings of all the prominent Apples, Apricots, Cherries, Currants, Figs, Filberts, Gooseberries, Grapes, Melons, Nectaines, Peaches, Pears, Pines, Plums, Raspherries, Strawberries, Nuts, &c. By George Brackshaw, author of the "Pomona Brittannica."-In 2 octavo volunies, with 104 large colored engravings-price \$7 per volume. The original cost of the work was \$32,00.

Fir Trees.

200 very handsome Fir Trees for sale, at the garden of S. Downer, in Dorchester, by Rufus Howe.

Sweet Potato Slips, Cauliflower Plants, &c. Just received at the Seed Store connected with the New England Farmer, No. 52 North Market Street, A few bushels Carolina, or Sweet Potato Slips, for plant-

Also, Early Cauliflower Plants at \$1,00 per 100, in fine order for transplanting—and Early Cabbage plants, 75 cents per hundred.

Asparagus Roots, 2 to 4 years old, 75 cents to one dollar per hundred. Rhubarb Roots—the large Dutch Currant Bushes, one dollar per dozen, Grape Vines, Hawthons, &c. &c. Any of the above roots, that may require it, will be well packed in moss, to ensure safety in their transportation.

Roman.

This very elegant, full blooded horse, imported with a hope of improving the breed, will stand this season at the farm of Mr Stephen Williams, in Northborough, County of Worcester,

where some of his stock may be seen.

Roman was purchased in England of the Earl of Warwick, and his pedigree has been traced in the New Market Studbook from Childers, the awifiest horse that ever run over New Marfrom Chiteers, the avillest horse that ever run over New Mar-ket course, through eight generations of the highest bred horses and mares in England without a single cross of inferior blood. A14 years old he won 5, end at 5 years old he won 4 prizes, and has since beat some of the fleetest horses in England, over the must celebrated courses.

His color a very liright hay—black legs, mane and tail—walks and trofs weil—is very good tempered—high sprited—active—151-2 hands high, and is considered by judges as handsome and well formed a horse as can be found in the coun-

Marcs have been repeatedly sent to him from Maine, Rhode Island, and Connecticut, as well as from the remote counties in this State, and the neighboring towns, and his colts are handsome and command high prices.

Terms-\$20 the season, to be paid before the mares are taken

Northborough, Mass, April, 1829.

Crockery, Glass, and China Ware.

Ephraim B. MeLaughlin, 4 Dock Square, has for sale, an elegant assortment of newest patterns in the above line, which are offered at low prices for cash. Country merchants and others are invited to call. eptf mar27 others are invited to call.

Imported Horses.

Barefoot, and Cleveland, the two English horses, will stand for the season at their stable in Brighton. Barefoot at \$25, and Cleveland at \$10, with \$1 for the groom.

MISCELLANIES.

From the Evening Post.

SPRING.

The levely Spring-the joyous Spring Comes o'er our clime again, A welcome to its blossoming, Its fleet but smiling reigo.

This morn a carol from the vale, Light hearted, soft, and free, Came freighted on the gentle gale, Whispering of Spring to me.

The blessing of the showery skies Has fallen on the grove, And peeping from their low disguise, I see the flowers I love.

The yellow, mottled, crimson, blue, Their thousand tints display, And all of balm and brilliant bue, Meet in the fair array.

The south, the south, the balmy south, How breathes it o'er the heart. Each flowret ope's its silken mouth, And feels new fibres start.

It gives a life to dormant powers. Their fetters off it flings. And bears away the laughing hours More gladly on its wings.

Now brightly glows the freshen'd sky. The clouds are gaily bleat, Fringing their fleecy tapestry, With golden garnishment.

The rills flow purer, and they fling A gush of music out, Whose cadence is, 't is Spring, 't is Spring,-'T is Spring, my pulses shout.

The Nest of an Ostrich, found in South Africa bu Mr Broadbent, a Missionary .- The eggs were forty-two in number, including the two which had been taken away before, and were arranged with great apparent exactness. Sixteen were close together in the middle of the nest, and on these the ostrich was sitting when we arrived : they were as many as she could cover. The remaining twenty-six were placed very uniformly in a circle about 3 or 4 feet from those in the middle. The eggs which were in the circle we found to be quite fresh, at which I expressed my surprise.— The Hottentots informed me that these bad been provided by the ostrich against the hatching of those in the middle, when she would break them one after another, and give them to her young ones for food; and that hy the time they were disposed of in this manner, the young ostriches would be able to go abroad with their mother, and provide for themselves such things as the desert afforded. I have seen 'large flocks of these creatures in South Africa. The fact which I have just stated, relative to the preservation of a quantity of eggs for the subsistence of the young ones immediately after they are hatched, affords as striking an illustration of a superintending Providence, perhaps, as the whole circle of natural history affords.

Why does a razor cut better after having been dipped in hot water ?- The brief article below on this subject has been condensed from a recent Loudon publication; and may not be unacceptable to those who delight in a " close share."

This cutting question has been frequently agitated in newspapers and other periodicals; and in answer to it, the following remarks have been dictated "by a thinking man, with a small portion of chemical knowledge."

Hair, horns, hoofs, and nails, are principally composed of hardened gelatine; now, gelatine possesses the property of becoming softer, or more easily divisible into parts, either by being soaked in hot water, or by caloric applied in any other way, but not in so great a degree in the latter case, as in the former; it follows, therefore, that to produce a maximum of effect, the hair. hern, &c. should be as wet, and the cutting instrument as het as possible, short of burning the animal substance.

If one desires an experiment to convince him that this is a property of gelatine, let him dip two fingers into warm water, and two others into cold: upon cutting the nail upon one of each, with a cold knife, he will find that on the warm finger cut easier than that on the cold, and both of them easier than that on a dry one. If, now, the knife be warmed in any way, the effect will be more visible on all three. This is precisely what is done in shaving; lather is first applied, which can never continue hotter than 98 deg. because that is the temperature of the human body, and it is rapidly brought down to that by evaporation from its surface; the hair is not sufficiently softened by this heat for some persons' feelings, therefore they increase the heat of the razor to 150 deg.; if they go much farther their sensations tell them to stop. It is by no means essential that the razor should be dipped into het water; heated mercury would do as well; but we use water because its temperature is more equable, and because it is more common and convenient than the other.

The old barber's fear of dipping his razer into hot water, surely showed, that though a shaver, he was no cutter, and his apprehension of altering the temper of his tool, could not have been excited, had be known that, in tempering it, it had already been exposed to a temperature of 480 deg. or thereabouts-168 deg. higher than he was frightened at .- Traveller.

The Editor of the New York Evening Post applies to Dr Holyoke, the following lines from Cowper's translations from Vincent Bourne:

> Ancient man, how wide and vast To a race like us appears, Rounded to an orb at last. All thy multitude of years!

A man's best fortune, or his worst, is his wife. Beware how you choose her.

The Kennebec Journal, states that fortunately for the world, the proper use of N. E. rum has For Sale.

A valuable Real Estate in Milton, 9 miles from Boston, on the road leading from Boston to Faunton, Bridgewater. and New Bedford, containing upwards of 200 acres of the variety of lands and fruits suitable for a good farm, well watered, with good substantial buildings. Said farm is calculated to suit a gentleman of taste, or an enterprising young man for a milk establishment, being an excellent grass farm. The purchaser may have, including the buildings, from 100 acres to the whole.

As the above described property contains a large portion of valuable wood land, the purchaser may be accommodated with more or less of that part. The place will be sold at a fair price, with or without a very valuable stock and farming utensils.

Also, for sale, or to be let, opposite the above named premises, a large, convenient Dwelling House, with a good Bake House and out buildings, very pleasantly situgood bake rouse and out unlangs, very pieasantly sua-ated for a country seat or a good stand for a store or country baking, with as much land as may be wanted for the accommodation of the same. For further information, inquire of the Editor, of Parker H. Pierce No. 95 State street, of Nathaniel Blake at Indian Queen Tavern, Bromfield street, of A. M. Withington, Roxbury, or NATHAN-IEL TUCKER on the premises.

INSECTS ON VINES. Weston, 11th May, 1829.

Mr J. B. Russell-In compliance with your request, to state the substance of our conversation, last Saturday, on the cultivation of squashes and other plants exposed to the devastation of bugs, and the best method to prevent it, I will say briefly, that it is a matter of great difficulty to protect dry seasons. And the more so yet, if the plantation is made successively from season to season upon the same spot. I expect that they deposit their seed in the soil, and that it is the cause why much fewer insects are seen the first year, that to that they multiply afterwards, from year to year, until it becomes almost impossible to save the plants from destruction. It is owing also to the same cause, I expect, that we meet with much Pumpkins planted in a potato field, sticking the your friend and servant, seeds in the hills, and left to their own chance, I have seldom known to be materially injured. Millinet frames may answer a good purpose, but it would be expensive for a large cultivation, besides they deprive the plants of some portion of air, and heat, and cannot protect beyond certain narrow limits, which the vines will soon outrun.

SWEET POTATOES.

MR EDITOR-Finding that the people of your region are semewhat awake to the subject of cultivating the Carolina, or sweet potato, I have concluded that it would be profitable for them to receive correct information relative to the culture of this valuable root, and it will afford me no small pleasure to communicate it, if you will have the goodness to give it a place in your invaluable pa-

METHOD OF RAISING SWEET POTATOES IN A NORTHERN CLIMATE.

As early in the spring as the season will admit, MR FESSENDEN-I observed in the Centinel of make a hot bed, which must be covered five or six inches with good rich soil. Lay your potatoes side by side, and cover them 13 inches deep with earth. If you cover your bed with glass, your out glass will answer every purpose, and be sufinches high they will be fit for setting out, which should be done in the following manner. After making your ground perfectly mellow, furrow and cross it four feet each way. At the crossing of the furrow place a shovel full of fresh manure from the horse stable. Level your manure and cover it six or seven inches with earth, leaving it flat on the top, 8 or 10 inches. It would be well to have your hills made a few days previous to planting, so as to be in readiness to embrace the first favorable season for setting your plants.

Now take your potatoes out of the bed, and on examining them you will find a sprout coming from the eye, and a little above, several coming from the first, all with small roots. Three of these twenty-nine hills from a single potato, which produced a good yield in the fall season. After cutting off all the sprouts, plant your potatoes as before, and they will, after this, send forth many good shoots. Set your plants deep in the hill, nearly down to the manure. This manure not only furnishes notriment for your plants, but will determine the length of the potatoes, which will be from the top of the ground to the manure .-This is an important consideration in raising this species of potato. Many kinds of the sweet potato are inclined to grow long and slim, but by the method, which I have laid down and followed for many years myself, any person with a little experience may raise these roots to any given length, by leaving the earth at his last hoeing as deep over the manure as he chooses to have his potatoes long. One thing more in relation to the size of your hills, and I have done with the planting part. In warm countries, they may be large, but in New England they should be small in order that the sun may thoroughly warm them through. as this kind of plant is fond of heat. Let one heaping bushel of earth be a rule, a little over or under may answer.

METHOD OF SAVING SEED.

Make a box of any given dimensions; inclose this with one five inches larger. The inner box will answer without either bottom or cover, say four boards nailed at the corners, remembering also to have it five inches lower than your outside box. Your roots should be dry when put up .-Prepare some sand quite dry and eover over an inch or two deep the buttom of your inside box, then cover the sand with a layer of potatoes, and so on alternately until your box is full. The space hetween the boxes must be crowded full of swingle tow, and, having laid an equal quantity on the top, nail on your cover. This box may be placed on a second floor where there is a warm fire kept all winter in the lower room. Or they will keep well under any common hearth, packed in a box of sand; or in a warm store room, packed in the same way. Merely preventing them from freezing does not answer the purpose; they require to be frequently warmed through and through. If you are in want of seed potatoes in the spring, as soon as your vines begin to run, cut off the tops and plant them; they will soon grow and make the best roots for seed. CALVIN MORRELL.

Ohio, March 26, 1829.

SUGAR FROM THE BEET.

[Extract of a fetter to the Editor from Mr CALVIN MOR-RELL, Hamilton County, Ohio.]

Six-Having for several years past, heard much about making sugar from the beet, I have, with avidity searched every paper that came in my way, in hopes of finding some regular process laid down for extracting the saccharine qualities of that valuable vegetable. But, unfortunately, all my researches have hitherto proved abortive. Being a lover of horticulture, I have, for many years past, been in the habit of raising several kinds of heets, excellent for culinary purposes, and, not knowing that the sugar beet differed from those which I had been accustomed to cultivate, I concluded vessels may stand below them for receiving the ginous particles of the roots should take place .to make an experiment.

A quantity was sliced, boiled, strained, and boiled down. This extract produced a very beautiful ed down. This extract produced a very heautiful sels. When the beet roots, thoroughly dried, yet it should be daily boiled down to the consist-syrup, without the least taste of sweet. Totally have been sifted, so as to be free from the dust ence of a syrup, in order to prevent its fermentadefeated in my experiment, I concluded to wait and loose fibres, one of the highest tubs should be tion. In boiling the liquor, the scum that arises for information. Last year I became a subscriber balf filled with them, and clear cold water poured should be carefully taken off.

come to hand, before I found something very en-roots. In this they should remain for about three couraging about the beet. It was stated that fifty hours, stirring them at different times with a establishments were already erected in France for wooden paddle. At the end of this time, the same making sogar from the beet, and present appear- number of clean dried roots should be put into the ances indicated that their home manufacture of second tub; and the sweet liquor drawn from the this article would shortly supersede the necessity first tub into the vessel under it, should be poured for importation. Several pieces of smaller note upon the roots in the second; and the first tub appeared; I read them with my usual anxiety, should be supplied with fresh water in such quanbut not a word of the process. best sugars is as follows. First hoil the extracted hish the whole Prussian dominions with sugar. saccharine liquer down to the consistence of a syrup; then put it into a copper, of which one third at least is empty, and let it boil away by a moderate fire, until a phial which holds one ounce of water, will contain cleven drachms of the syrup, or till the syrup pours somewhat broad from the ladle. The seum or froth should be taken off as it rises. When the syrup has arrived at the state above mentioned, by gentle boiling, the fire must be removed from underneath the copper, and the syrup gradually run through a clean wootlen cloth, the liquor; add to the residuum a solution of sul- call chatter, and which encourages the growth of placed over a wooden or stone vessel. The syrup phuric acid, and boil again; the lime uniting with the slender side shoots, which are the froit bearmust not cool too much before this filtration, or the acid, is got rid of by straining, and the liquor ers. The ripaning of melons is much hastened else it becomes ropy. When the syrup is somewhat cool, it should be laded into shallow wooden or stone vessels, to chrystalize; for this purpose, shallow earthen vessels, such as are used to produce cream, or vessels made of tin, are proper. a room heated to about 680 of Fahrenheit, and care must be taken to keep them free from flies and dust. If the syrup has been of a proper consistence, crystals will soon begin to form at the bottom of the vessels; and in an interval of 18 or 21 days the crystalization will be completed. The an establishment of the kind in the United States, mass must then be put into a strong linen sack, from those existing in France and Germany. The well secured, and placed under a press, to squeeze out the liquid from the sugar which remains in the bag. The liquid matter may be set to chrystal- among the items which deserve to be well canize a second or third time, and will yield sugar of vassed before a large manufactory is attempted .a coarser quality. A cheese press, or long lever | We believe about twenty tons of sugar beet to an will serve the purpose of pressure. The sugar acre may be raised with facility in the United first obtained, may be rendered purer by mixing with it a quantity of clear spring water, and placing it again under the press; the colored syrup will then run out, and leave the sugar in the bag in a much purer state than before. By repeating the operation it is so far improved, that, when dried and rubbed, it becomes a fine, white, powder sugar. The separated syrups should be again carefully boiled, and more sugar will be ob- if a person accustemed to the manufacture of beet tained from them by crystalization. If the sugar procured from the first pressure be dissolved in as much clear water as will form a syrup, and placed again in a warm room to crystalize, it will yield a much purer and harder sugar: the syrup may then be separated without pressure from the sugar, merely by inclining the vessel, and allowing the syrup to run off from the crystals. All the syrups thus prepared are fit for family use, and are much superior in taste to those prepared from the pressure of the raw or boiled roots. The remaining thick syrups may be used as treacle, or molasses, and will serve to distil for rum or spirits.

The produce of beet roots, and their quality for vielding sugar have been variable, and of course the profit accruing from them. From M. Achard's account we learn, that 24 measures of roots, each of which weigh about 90 pounds, (in all 2160 pounds,) produce 100 pounds of raw sugar; that is 20 pounds of roots produce nearly one pound of sugar. One hundred pounds of raw sugar give 55 pounds of refined sugar, and twenty-five pounds of molasses. Another statement informs us, that 14 pounds of raw sugar gave 13 pound of lump the size and the quality of the fruit; it is advisasugar, 18 pound of white powder sugar, and 18 ble to take off late blossoms and small squashes of a darker colored powder sugar, and 8 pounds of brown syrup; from which more sugar might have been obtained. It is computed in M. Achard's account, that a German square mile of land, some of the nourishment. When the lutter part the quantity and quality of the milk and butter. (that is 16 square miles English,) properly culti- af the season comes on, and the squashes have Westfield Register.

The process of boiling, chrystalizing, &c. the vated, would produce white beet sufficient to fur-

Loudon's Encyclopedia of Gardening, in the index, under the head " Beta," has the following re- benefit of the sun, and to cut off freely the stragmarks, "It is from the roots of the beta ciclathat the French and Germans obtained sogar with which bear fruit; this will hasten their maturity so much success during the late war. The fol- and perfection. The same system of pruning is lowing was the ordinary process:-Reduce the still more needful for musk melons; it will imroots to a pulp by pressing them between two prove the flavor and the size of the fruit, and is, rough cylinders: put the pulp in bags and press I believe, universally practised in the old counout the liquor it contains; boil this liquor, precipitures. The French always pinch off the small top tate the saccharine matter by quick lime, pour off of the heart, at the earliest period, which they may then be gently evaporated, or left to gram- by placing under them, when about the size of an late slowly, after which it is ready for undergoing the common process for refining raw sugar." The foregoing contains all the information on

this subject, which we can at present readily ob-These vessels, filled with syrup, must be placed in tain. Should anything further occur of importance, we shall be gratified in publishing it. In forming an opinion of the expediency of attempting to manufacture beet sugar in this country, many things are to be taken into consideration. which would vary circumstances connected with price of labor in this country, the price of sugar obtained from the cane, and from the maple, are States; and if, as M. Achard supposes, 20 pounds of roots will give I pound of sugar, we may have at least 400 pounds of sugar from an acre of roots. Besides the refuse matter of the roots containing starch, mucilage, &c. would prove valuable for feeding cattle, &c. The tops would also be serviceable for the same purpose. But we must be sugar in Europe, could be found, and induced to superintend an establishment for that purpose, in this country, it would save much labor in experiments, and give a much fairer prospect of eventual success.

FOR THE NEW ENGLAND FARMER.

CULTURE OF SQUASHES AND MELONS.

Ma Epiton-Squashes, melons, and all other vines require good old manure; nothing suits them better than vault manure, kept one year after it is taken out; hog's manure is excellent. There should be, for squashes, five or six shovelfuls to each hill, distance about six feet; as the vines expand it will be very useful to check their growth for the benefit of the fruit. It is generally placed on the side shoots, and only one squash should be permitted to grow on one side shoot, and as sconas the blossoming is over, the shoot should be stopped by pinching off the head of it. The main vines should also be stopped after they have a sufficient number of side shoots and squashes. This kind of pruning will have a tendency to improve which have no chance of coming to maturity be- or Swediah turnips, for feeding exen, and as a fore the white frosts take place, and which would winter food for mileh cows; for the latter purinjure the earlier and better fruit, by depriving it of pose, its superiority is very evident in improving

break off the leaves wherever they shade the fruit, in order that it should have the uninterrupted gling vines, so that none should be left but those egg, large pieces of slate stone, or a shingle; the melons are also kept from ground worms by this process. Although our soil and climate are more powerful and forcing, and might dispense in some measure with these refinements of the gardener's art, yet they will repay well for the little time and attention required, and I have always found it inv pleasure, and my advantage, to attend to it regu-J. FOR THE NEW ENGLAND FARMER.

GRAFTING THE VINE.

MR EDITOR-After making many fruitless attempts to cultivate the vine by grafting, I have, the past season, succeeded to my entire satisfaction. The result of my experience I wish to communicate to the lovers of horticulture, through your useful paper.

Early last spring I took two wild vines from the trees, where they grew naturally, which I suppose were an hundred years old. I dug a trench about six inches deep, from the roots to a convenient place, where I had trained the vine to graft. In this trench I buried the vine in suitable careful to obtain the proper variety of beet; and branches for grafting, and there inserted the grafts,which were also covered, leaving only one cys above ground. At the usual time for such buds to break, mine burst forth, with a degree of exuberance, which I had never before witnessed, insomuch that I had to prime them every ten days throughout the season, to keep them in tolerable order. Some of these graffs grew nearly twenty feet long, producing fine bearing wood for the next year, and several fine bunches of grapes the first season. I think, on a moderate calculation, I shall have the ensuing scason, several bushels of grapes from my two vines. CALVIN MORRELL.

Hamilton County, Ohio, March 25, 1829.

CARROTS.

The following mode is recommended of rendering the cultivation of this valuable root less expensive and troublesome, viz .- to sow the seed on some very rich mould under a hovel, about a fortnight before the field is ready, and then drill, mould, and seed altogether, having had it well stirred every second day, and kept sufficiently wet to cause it to vegetate. This operation enables the grower to clean his land, and to pulverise it, so as to make most of the troubleseme annual weeds, and give the carrot a considerable start,-The crop is much preferable to mangel wurtzel.

From the Daily Advertiser.

BEES. In an article written by Mrs Griffith of New Jersey, which appeared in the North American Review, for October last, an anecdote is related, which is in substance as follows :- An old French bishop, in paying his annual visit to his clergy, was afflicted by the representations they made of their poverty, which the appearance of their houses and families corroborated. Whilst he was deploring their sad condition, he arrived at the house of a curate, who, hving amongst a poorer set of parishioners than any he had yet visited, would, he feared, be in a still more woeful plight than the others. Contrary, however, to his expectations, he found appearances very much improved. Everything about the house were the aspect of comfort and plenty. The good bishop was amazed. "How is this, my friend," said he, "you are the first man I have met, with a cheerful face and a plentiful board. Have you any income independent of your cure? "Yes, sir," said the clergyman, "I have; my family would starve on the pittanee I receive from the poor people I instruct. Come with me into the garden, and I will show you the stock that yields me an excellent interest." On going to the garden, he showed the bishop a range of bee hives. "There is the bank from which I draw an annual dividend. It never stops payment." Ever after that memorable visit, tribute to the abundance of the fruits of the earth. when any of his clergymen complained to the With these coinciding ircidents, the wise, about bishop of poverty, he would say to them, "keep weather, predict unusual fertility, and other sympbees, keep bees."

We dare say that our readers will entertain a very favorable opinion of this piece of advice, on and of intense verdure. reading the ensuing paragraph from the Worces-

Remarkable Increase .- We have been furnished by a friend with an account furnished by David Royce, of Ripley, Chatauque county, New York, of a remarkable increase of Bees belonging to him; the correctness of which statement is certified by the Postmaster and public officers of the town.-In the course of something less than seven years and a half, from a single swarm of bees, he had taken up 31 swarms, from which he obtained for use 1705 pounds of honey; ten swarms had cscaped to the woods and were lost; and eightyeight swarms remained in their hives, in which there was, by the estimate of intelligent and impartial men, not less than 7664 pounds of honey, making a total of one hundred and thirty-nine swarms of hees, and nine thousand three hundred and sixty-nine pounds of honey. The honey, at the price it is usually sold in this vicinity, would amount to more than fifteen hundred dollars. We know not why bees, with proper attention, may not do as well in this section of the country as in any other; but, if they will, with the best of care, yield half as much increase as the above, to what more profitable business can the farmer turn a portion of his attention?

The liberality of the Legislature has again afforded to the Agricultural Societies the means for extending those encouragements to industry and skill, which have heretofore been found so praetically valuable. Among the objects marked with lows :- The grain to be first steeped for twelve peculiar favor, is the manufacture of Silk, and in accordance with the direction of the donors, the from a well; then to be added to the water six- digris. Society of this County have offered a premium of teen or seventeen drops of oxymuriatic acid for

with regard to size and number growing in 1832.

The trees which furnish food for the busy spinners of the native silk, are more beautiful in aupearance than most of the pampered exotics which are permitted to lurk about houses and gardens, They would form the appropriate ornaments of our highways, and while they covered from sight those borders of gravel, rock, and bramble which dishonor our roads and disgrace the proprietors of It is also recommended, when practicable, to the soil over which they pass, would furnish a healthful and innocent employment to the members of the farmer's family whose occupations are at present limited. The gathering of green leaves, the feeding of the insect weavers, the processes of manufacture, might well supply the place of the card setting and the straw braid which were once almost the universal employments of the females of a family. On the hab ts of domestic industry and economy depend much of the happiness and prosperity of the community, and as one of its members we rejoice to observe the encouragement of any stream of wealth whose source shall be on the household hearth .- Nat. Egis.

AGRICULTURAL PROSPECTS.

It has been remarked, that winters of deep snow are followed by rich harvests. The vernal eold by cheeking the premature advance of yegetation, cheerless as it is in passing, is said to contoms favor the belief that the plenty of former years will be renewed. The grasses are thick set Winter grains have a fair appearance. The backwardness of the spring has retarded the usual operations of the farmer, and cold and wet prevented the early preparation of the ground for planting. The fruit buds of the peach are few; but with this delicate tree it may often be noticed that the exuberance of blossoms is no certain indication of the abundance of autumnal products, and that when its branches are most thickly covered with flowers much of the fruit falls immature. The pear and apple are full of buds, and promise to fill the basket and barrel to overflowing-Ibid.

AGRICULTURAL.

The Middlesex Agricultural Society, in their list of premiums, just published, offer for the best plantation of White Mulberry trees, not less than 150 in number, which shall be in the best condition in the autumn of 1830, a premium of \$25; next best \$15; for the best specimen of silk, not less than 5 lbs. \$9; next, \$7; next, \$4. They also offer premiums for various kinds of fruit and forest trees. The Society in this county, a few years since, offered premiums for plantations of White Oak trees, but we have not understood that they were ever elaimed .- Mass. Spy.

Fertilizing effects of Chlorine on Seeds for Sowing .- The employment of chlorine, or oxymnriatic acid, in preparing seeds for sowing, is recommended by M. Remord, as capable of increasing the product three and four fold what it would be in ordinary cultivation. The process is as folhours in water from a river or fountain, never sixty dollars for the best nursery of mulberry trees, every quart-the whole to be shaken together, in er, by L. Sable Normand.

order that it be well mixed. After six hours additional soaking, under exposure to the sun and beneath a glass bell; or for want of such an in-strument, a frame of oiled paper, the seeds to be put into a cloth; then to be divided for the purpose of sowing, and mixed with a sufficient quantity of cinders, sand, or dry mould; after this, to be sown, and the water in which they were soaked thrown over the ground which covers them. water, at intervals, the plants, with acidulated water of oxymuriatic acid, in the proportions of that used in steeping the seeds, in order to keep up the activity of their vegetation, and to favor the development of the plant .- Bull, Univ.

RYE COFFEE.

One reason why this article is not more used is, that few know how to make it. We know a lady who after several vain attempts to suit herself with it, happened to recollect, that when rye is sown, the operation of heat and moisture cause what is called the saccharine fermentation to take place, by whieli sugar is formed; after which, the sprout immediately begins to show itself. She therefore kept her rye moist, and moderately warm, till the swelling of the sprout showed that the fermentation had begun, and then dried and burnt it with all possible despatch, in order to arrest the process before the rye should become sour. Her success was complete, and her knowledge of chemistry was of use to her husband's pocket .--Maine Farmer.

Farmers might easily save the flesh of Horses and Cows, and confer a great kindness on their animals, in preventing the usual annoyance of Flies, by simply oiling the parts most exposed .-Flies will not alight a moment on the spot, over which an oiled sponge has been pressed. Probably either fish or flaxseed oil would answer; but what I have known used with success was the Tanner's oil. Every man who is compassionate to his heast, ought to know this simple remedy. and every Livery Stable, and Country Inn, ought to have a supply at hand for the use of travellers. Ibid.

Sulphuric Acid Springs .- The second number. vol. xv. of the American Journal of Science, contains an account by Prof. Eaton, of certain springs of water, impregnated with sulphuric acid, in the town of Byron, Genessee county, N. Y. One of the springs emits a perennial stream, sufficient to turn a light gristmill, and is so acid as to coagulate milk. The fact is the more remarkable, as but two other instances of the kind are known, and both of these in volcanie regions.

Antidote against the Poison of Verdigris .- M. J. Charles Gallet, late anothecary of the first class, in the armies of the North, and Italy, had by a mistake poisoned himself with verdigris. He was vomiting with great efforts. During the time some persons around him had gone for some oil which he had sent for, but feeling extremely thirsty he drank a glass of water with a great' deal of sugar diluted in it. His pains diminished. He then ate sugar and was perfectly cured. The remedy often repeated since with success has proved that sugar is the true antidote against ver-

gigantic oyster, in many parts of the Southern N. Y. Journ. of Com. States. They are found not only in digging for wells, but they form vast beds in various places.

One of the largest beds on the eastern continent, is near Tours, in France; it is twenty-seven miles long and twenty feet thick.

But the heds of the Southern States far exceed this. A stratum, on the whole continuous, although mixed, more or less, with the general diluvium, and other materials of the country, has been traced from the Eutaw springs, in South Carolina, to the Chickasaw county; six hundred miles in length, by ten, or from that to one hundred in breadth.

There can be little doubt that many of the beds of oyster shells which have been attributed to the aboriginal Indians of this country, are diluvial deposits .- Silliman's Geol.

Use of the Roller on Grass Lands .- In no branch of husbandry is the roller more an implement of utility than in the cultivation of grass. It renders the soil compact and solid; it encourages the growth of the plants, by bringing the earth close to every part of the root; it assists in filling up and levelling any inequalities in the surface of the field, thereby preventing surface water from remaining stagnant, and eradicating the grass from particular spots; and it tends to hinder the drought from penetrating, which is an effect of the greatest importance. In fact, a grass field cannot be too often rolled; and it is not going too far to assert, that the application of the roller in Autumn to prepare the roots for resisting the winter frosts, and in spring to firm them after those frosts, every year while the field remains in grass will amply repay the expense .- Trans. of the Highland Society.

Florida Indigo .- It is proposed to revive the cultivation of Indigo, In Florida. Formerly much indigo was produced there, and which was only rivalled by that of the Carraccas. In former times, nearly one hundred and eighty thousand dollars were paid in London, in one year, for Florida indigo.

Steel Ore .- We use this label to indicate a to light in Hadley, Saratoga county. NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 22, 1829.

LITHOGRAPHY AND GEOGRAPHY.

We have been very much gratified by some specimens with which we have lately been favored, of Geography illustrated by Lithography, or the Art of Printing on Stone. A map of Natick. Mass., on a scale of 2 inches to a mile, beautifully executed, by Pendleton, Boston, is a superior sample of an useful and ornamental art, employed to illustrate an important science. The lines are clear and distinct, the buildings, roads, woods, waters, &c. are pointed out with a neatness and precision, which are rarely if ever attained in copper plate engraving; and copies of the kind can be afforded, we are told, at an expense which is very trifling, compared to maps, executed in the old style. If maps of every town in Massachusetts were formed in this manner, they would supply the materials for State Maps, and add articles of great value to the archives of useful knowledge.

Self knowledge has been highly and justly recommended in many adages in various languages. And next to knowing what we are, is the importance of knowing where we are. We should have correct ideas of our relative location, compared to that of other inhabitants of our planet, and particularly to those of our vicinity, or the world is to us as it were a wilderness, a sort of chaos, "without form and void." If geography on a large seale, a knowledge of distant countries is an important branch of education, surely the topography of our own residence and its vicinity, is of still greater importance. Yet many of our youth who are receiving an education, and acquiring a stock of what should be useful knowledge, know more of Greece, or Rome, London, or Paris, or perhaps California, than of that part of the land they live in, which is not in sight of their own dwellings, or on their read to market, or the meetinghouse.

FOR THE NEW ENGLAND FARMER.

SOWING GRASS SEEDS.

MR FESSENDEN-In the perusal of your last number of the New England Farmer, I observed a very well and ably written article upon the subject of sowing grass seeds in the fall of the year, in preference to the spring. As I am young in the business of agriculture, I beg your indulgence, and hope that I shall not weary your patience. with the few remarks and inquiries, which I take the liberty of sending you, for a more full and particular explanation in relation to this very important operation in agriculture.

Your correspondent in Weston, observes, in the close of his communication, that "general rules are subject to many exceptions, and particularly

from your respected correspondents. It appears to be somewhat a new mode in the practice of husbandry, in the New England States, or so far as I have information. In this community the general practice is, to sow the grass seeds in the spring, with oats, or rve, and the like. But if buds I have known also, to blossom the next there be a better way, we cannot too soon con-spring after inoculation. Two years after buds vince our jucredulous neighbors of the fact, that it may become a general practice among the farmers, to sow their grass seeds in the fall, when there is more leisure time, than in the spring, when the farmer has as much or more than can be well at- grafting, or inoculation, therefore, particular attended to. I read, some time since, that grass tention should be paid in selecting scious. seeds might be sown in the fall to the benefit of the farmer; and that he might realize a crop of grass the next season, and that he might be more sure of realizing a greater crop than when robbed of a greater part of its nutriment, by being sown so far back as the 12th of April, was not received with spring grain, which is always triumphant; till the 13th inst, too late for our last paper .and the interference of the roots among the ten- EDITOR. der grass, and the straw, which in a great measure will deprive the grass of the benefits of the MASSACHUSETTS HORTICULTURAL SOatmosphere: and that he might be saved much trouble and vexation by sowing his grass seeds alone, which otherwise he would be subject to ex- Horticultural Society, on the Culture and Products perience.

I then mentioned the subject to one of my neighbors, who had long been engaged in agriculture. He told me that was a new notion, and that it would not do to follow every current that runs; members of the Society are entitled to these prethat it was something be had never heard or miums. dreamt of, in the course of his long life, and that ASPARAGUS, 50 in a bunch, earliest and best he was confident it would not do, because it appeared to him an unreasonable practice. I, therefore, of course paid no more attention to the subicet. But from the sentiments set forth by your correspondent in Weston, I perceive several ad- CARROTS, twelve roots, the earliest and vantages from this mode of husbandry above the one now generally practised in this ecommuni- BEETS, twelve roots of the earliest and best,

I have a small field which contains about thirteen-sixteenths of an acre, from which I raised, the last season, 20 bushels of Indian corn, 75 bushels of potatoes, and between 30 and 40 bushels of apples. The land is very low, and was not planted till the eighth day of June, on the account of its being so wet and muddy. From those who are conversant in the fall sowing of grass seeds, I would solicit some further remarks, whether it would be as profitable to sow such low land as above mentioned, in the fall, or whether I should experience a total loss of my labor if I should undertake to have my grass seed sown on it in that season of the year? The subject, in this part of the commonwealth being a new thing, the people will without doubt be very incredulous in regard to adopting it. The crop that I intend to take off this season, I shall not be able to harvest before the last of September, or first of October: will it then be profitable to have the field sown to grass so late in the season of the year?

In sowing grass seeds in the spring of the year, along with other grain, it is true, both undoubtedly would in some measure be injured by each other, but whether they would be of so much damage to each other as the expense of getting in the grass seeds after the spring grain is harvested, is, I think, a matter worth investigating.

GRAFTING.

It is now about the season of the year for engrafting young fruit trees-those who want to so in agriculture." I, therefore, wish some further avail themselves of the opportunity would do well

loves, and she is bound to act for their good, and information through the medium of the Farmer, to pay particular attention in selecting their scions. The scions for engrafting ought to be cut from healthy bearing trees; and cut from the top. I say from the top, because I do not mean sprouts nor suckers from the body. I have known scions blossom the same season that they were set, and were set I have known the stocks to bear as good fruit as the original tree. Whereas scions or buds that have been taken from sprouts, or suckers, have not borne fruit for several years. In

sal," contains some important views on the subvery slight foundations; and he maintains, in short, that there are, strictly speaking, no hetions to contract maladies; and that by proper precautions, individuals born of parents subject to any of the maladies mentioned, may be secured from being themselves affected by them. The importance of this view of a subject on which there exists so many pernicious prejudices, and on which the fatality is sometimes so great as to cause the neglect of remedies that might be efficacious, is obvious .- N. Y. Courier.

From the New York Gardener.

THE BLACKBERRY,

Or Bramble, one of our native shrubs, well deserves a place in the farmer's garden, and will liberally repay the expense of cultivation. It should be propagated and pruned in every respect like the raspberry, but being somewhat larger, requires more room. It is very much disposed to throw off young shoots from the roots, and unless great care is taken to destroy them, they will spread, and fill the ground, and soon make an impenetrable wild. But this is no difficult task, if the space between the rows is well wrought, and kept, as it ought to be, quite free from grass or weeds.

The bramble, as well as the several kinds of raspberries, do not ripen their fruit at once, but in succession, for several weeks, as if designed to court our notice, and bountifully to reward the care we may bestow upon their cultivation, by a frequent offer of their bounties. The fruit should be regularly gathered as it comes to perfection, and be directly used after being picked; for although they may remain good on the bush a few days after being ripe, if kept in the house a single day, they will be found to have lost much of their delicious flavor.

A plantation of these shrubs will come to perfection in three or four years, and if nursed as above directed, will continue fruitful for eight or ten years. It should then be grubbed up, and entirely renewed. Two years, however, before this, a new quarter for this freit should be prepar-

The ground upon which the old shrubs have stood will be found to be greatly improved, and should now be employed for some other use.

Curious Discovery .-- The public have heard a great deal, and more than enough, of late years, of the merits and advantage of a particular instrument intended to supersede, in some cases, that most dreadful operation, the cutting for the stone. The instrument in question is so contrived that it may be introduced into the bladder with ease by the ordinary course; when its extremity is made to open into three or four slender branches, by means of a screw connected with the handle, with a view to grasp firmly the stone, if small, and

Non Existence of Hereditary Disorders .- A re- | thus bring it away. Cases have occurred, particcent work, L'Art de conserver la sante et de preve- ularly in the practice of Sir Astley Cooper, and Mr nir les Maladies Hereditares, by Dr P. I. Mongel- Brodie, where a succession of small calculi (in lez, of Paris, as reported in the "Bulletin Universionne instances to the number of fifteen and upwards,) have been thus extracted, and the instrusal," contains some important views on the subject of hereditary disorders; such as consumer ment has been very justly looked upon as a fresh | European trees, executing the tak in height, and equalting at the local policy of tion, scrofula, gout, gravel, madness, &c .- proof of the ingenuity and acuteness of modern sur-The author shows that the opinion that these geons. Recent excavations made in Pompeii, howevand various affections are hereditary, rests on er, have stripped our times of the honor of this invention, for in opening the dwelling of a surgeon among the ruins of that overwhelmed city, the reditary maladies; but only hereditary disposi- identical dilator and extractor here alluded to, was found among a variety of other instruments with which that dwelling abounded. The Pompeian extractor is made of bronze.

> Cultivating Fruit Trees .- Instruction in the culture of fruit trees, forms part of the education of the ordinary seminaries in the States of Mecklenburg Schwerin. No schoolmaster is admitted to exercise that function without a certificate of his capacity to teach the management of fruit trees. The same masters are obliged to take care of fruit gardens; and those who, previously to the promulgation of the law on the subject, were ignorant of the art, receive the due instruction at the expense of the school fund .- Bull. Univ.

> Great Parsnip .- Mr Walter Witheck, of this town, lately dug from his garden, a parsuip, measuring four feet ten inches in length, still leaving a part of the root broken off in the ground. If any one can beat this, it will do us a great deal of good to publish it .- Catskill Recorder.

> The Russian government has sent a skilful gardener to Kamtschatka, to instruct the inhabitants in the art of cultivating the earth to the greatest advantage. The climate of Kamschatka is not so severe as is generally supposed, and many vegetable productions may be raised there, with proper management.

Cabbages .- Dr Johnson, in his Journey to the Hebrides, remarks that before the Scottish peasantry acquired cabbages, from seeds left by Cromwell's soldiers, they had acquired nothing.

Everlasting Polato.-This root is ever ready to afford a supply of early potatoes from one end of the year to the other: they are left undisturbed except when a dish is wanted; they are not deep ly embedded, but soon discovered on stirring the surface mould. The flower seems somewhat different from that of the common potato. They should be planted about the latter end of May if planted sooner, they come too early. Before frost sets in, the bed is covered with litter as a protection from its influence. They are taken up at Christmas, as fine new potatoes, and are either suffered to remain undisturbed, or perhaps, wha is still better, the notatoes are completely forked up as they are wanted, and the smallest being separated are set apart for seed, under a heap, or hillock; to he replanted towards the close of the succeeding May. The smallest sprigs of this potato will grow.—Gardener's Magazine.

The end of the Law .- A Canadian paper contains six columns of advertisements of sales by the Sheriffs, concluded with the Coroner's notice of the sale of the Sheriff's goods .- Not. Egis.

BY S. T. COLERIDGE.

Swans sing before they die-'t were on bad thing Did certain persons die before they sing.

Seed of the Spanish Chesnut.

For sale, at the Seed Store connected with the New Eag-land Farmer, No. 52 North Market Street,

A few bushels of Spanish Chesnuts (Customea resca) for plant-A few missions of Spanish Chesion's Continuor result for plant-ing. These missivere imported by a gentleman of Salom, for the purpose of introducing the culture of the trees into New England. London deserties this as "the most magnificent of rooper—makes an excellent coppier tree for poles and hoops the back is equal in astrongency to that of farch, and mountain ash, for tamong—and the leaves and note (about six times the size of the common chesnut) afford food both for man and deer. and are destrable in autumn and winur." Price 8 cts per doz-

Also, Cotton Seed, for those who wish to cultivate the plant

Also, Coming Seed, in No. Will a first the Cultivate the place as a curiosity—price 12 cts n paper.

A few trees of the Admirable Atherge Rareripe, packed is moss about ten days since, and in good order for transplant-

New China Tea Sets, and light blue Dinner Ware. Received, a great variety of the above; which, with a complete assorting to Cinckery, Chinn, and Glass Ware, are of fered for side, luw, at No. 4 Dock Square,

MISCELLANIES.

FOR THE NEW ENGLAND PARMER.

MILTON HILL-SUNDAY.

My soul, look abroad on this pure, heavenly morning; Let the cares and contentions of worldliness flee: See its calm, holy peace, every object adorning !-Beneficent author, O, shed it on me!

How I love to repose on the prospect around; On the wide water's blue, and the rude mountain's green : On the trees, and the flowers-the valley, and mound, And the hills, and the fields, with the streamlet between,

Yonder isle in the ocean, illum'd from the sky, Seems it not like the place of the dying man' prayer? Oh yes, there is one he hath hoped for on high. The home of the blest-where the beautiful are!

Then submit, anxious heart, and doubt not the Power That sends the affliction, doth order it right; And will fit thee to welcome that trembling hour, When the soul, disencumbered, soars free into light.

Go kneel at the ultar in thankful devotion. Be at peace, troubled bosom-resigned to His will-Let the murmur of cares there be calm as that ocean. Which has listened to Him who commanded-be still!

Look abroad then, my soul, on this pure, heav'nly morning Bid the struggles and sorrows of worldliness flee, And that calm, holy pence, every object adorning, In mercy, and bounty, will come upon thee.

ESBEES.

THE RETURN OF SPRING.

BY J. MALCOMB, ESQ.

Dear as the dove, whose wafting wing The green leaf ransom'd from the main, Thy genial glow, returning Spring, Comes to our shores again; For thou hast been a wanderer long, On many a fair and foreign strand, In balm and beauty, sun and song. Passing from land to land.

O'er vine clad hills, and classic plains; Of glowing climes beyond the deep; And by the dira and mouldering fanes Where the dead Casars sleep; And o'er Sierra's brightly blue, Where rests our country's fallen brave, Smiling through thy sweet tears, to strew Flower offeriogs o'er each grave.

Thou bring'st the blossom to the bee, To earth a robe of emerald dye; The leaflet to the naked tree; And rainbow in the sky; I feel thy blest, benigo control The pulses of my youth restore; Opening the spring of sense and soul To love and joy once more.

I will not people thy green bowers, With sorrow's pale and spectre band; Cr blend with thine the faded flowers Of memory's distant land: For thou wert surely never given To wake regret from pleasures gone; But like an angel sent from heaven, To soothe creation's groan.

Then, while the groves thy garlands twine, Thy spirit breathes in flower and tree, My heart shall kindle at thy shrine, Aud worship God in thee:

And in some calm sequestered spot, While listening to thy choral strain, Past griefs shall be awhile forgot, And pleasures bloom again.

Music of Sabbath Bells .- There is something exceedingly impressive in the breaking in of church bells on the stillness of the Sabbath. doubt whether it is not more so in the heart of a populous eity than anywhere else. The presence of any single, strong feeling in the midst of a great people, has something of awfulness in it, which exceeds even the impressiveness of nature's breathless Sabbath. I know few things more imposing than to walk the streets of a city when the peal of early bells is just beginning. The deserted pavements, the closed windows of the places of business, the decent gravity of the solitary passenger. and, over all, the feeling in your own bosoms, that God is brooding like a great shadow over the thousand human beings who are sitting still in their dwellings around you, were enough, if there were no other eircumstance, to hush the heart into a religious fear. But when the bells peal out suddenly with a summons to the temple of God, and their echoes roll on through the desolate streets, and are unanswered by the sound of any human voice, or the din of any human occupation, the effect has sometimes seemed to me more solemn than the near thunder.

Far more beautiful, and perhaps quite as salutary as a religious influence, is the sound of a distant Sabbath hell in the country. It comes floating over the hills like the going abroad of a spirit, and as the leaves stir with its vibrations, and the drops of dew tremble in the cups of the flowers, you could almost believe that there was a Sahbath in nature, and that the dumb works of God rendered visible worship for his goodness. The effeet of nature alone is purifying, and its thousand evidences of wisdom are too eloquent of their Maker, not to act as a continual lesson ;-but combined with the instilled picty of childhood, and the knowledge of the inviolable holiness of the time, the mellow cadences of a church bell give to the hush of a country Sabbath, a holiness, to which only a desperate heart could be insensible.

Yet, after all, whose ear was ever " filled with hearing," or whose "eye with seeing?" Full as the world is of music-crowded as life is with beauty which surpasses, in its mysterious workmanship, our wildest dream of faculty and skillgorgeous as is the overhung and ample sky, and deep and universal as the harmonies are, which are wandering perpetually in the atmosphere of this spacious and beautiful world-who has ever heard music, and not felt a capacity for better; or seen beauty, or grandeur, or delicate cunning, without a feeling in his inmost soul, of unreached and unsatisfied conceptions ?- Amer. Monthly Mag-

Rail Road Carriage .- Henry Chew, of Baltimore, has obtained a patent for another applieation of friction rollers, to facilitate the operation, and to diminish the resistance of rail road carriages.

There is a pine tree in Gore, Upper Canada, which is 200 feet high, and measures at the base which is 200 feet high, and measures at the base 201 feet, and appears but little less at the height of sixty feet.—Keene Sentinel. of sixty feet .- Keene Sentinel.

Mangel Wurtzel, Sugar Beet, &c.

For sale at the Seed Store connected with the New England Furmer, 52 North Market street,

200 lbs. Mangel Wurtzel.

200 lbs. French Sugar Beet, raised expressly for this establishment, by John Prince, Esq. Roxbury.—The superiority of this seed and the excellence of the roots for cattle are too well known to need comment.

Also, roots of the Pie Plant, or Tart Rhubarb, in fine order for transplanting,-25 cts per root. Double and Single Dahlias, from 25 cts to one dollar each. The colors and form of this flower are magnificent, and are of the easiest culture, requiring the poorest soil, in which they bloom in the highest perfection. The roots are tuberous, resembling a sweet potato—can be packed for transportation to any part of the union.

Also, Double Tuberoses, Tiger Flowers, Amaryllises, Formossissima, &c., beautiful bulbs now in season to

Also, White Mulberry Seed, 30 ets per ounce, Lucerne, or French Clover, White and Red Clover, Sanfoin, Timothy, Orchard Grass, Oat Grass, Herds Grass, &c.

Also, several varieties of field coin, viz. the Early Golden Sioux, Gilman, Red, Turkey Wheat, Early Jefferson, (for the table) Sweet, or Sugar (for the table.)

(for the table) Sweet, or Sugar (for the table). The Early Tuscaroa Corn, a fine sort for the table: The Appalusia Melon—a new variety from Illinois, introduced by Doct. Green.—This melon was originally derived from the western Indians, by E. Warren, Esq. is in eating from the 1st of September to the 1st of November-melons small, remarkably sweet, with red flesh, and a very thin rind-25 cts per ounce.

Also, the Apple Seeded Melon, a very early variety. The Star Melon, a very late variety, of the Nutmer species.

Agricultural Books.

The third edition of Fessenden's New American Gardener; this work has been pronounced by the most ju-dicious horticulturists in New England and the middle states, to be the hest treatise on Fruit Trees, Vegetables, Grape Vines, &c., to be found in this country-price

The Vine Dresser's Theoretical and Practical Manual, on the Culture of the Vine; and Making Wine, Brandy, and Vinegar. By Thiebaut de Berneaud.

The Young Gardener's Assistant, containing Directions for the cultivation of Culinary Vegetables, and Ornamental Flowers. By T. Bridgeman, gardener, New York-price 37 1-2 cts.

A practical Treatise on the Management of Bees; and the Management of Apiaries, with the best method of destroying and preventing the depredations of the Bee Moth. By James Thacher, M. D.—price 75 cts.

Also, one copy of each of the following rare works:—

Phytologia, or the Philosophy of Agriculture and Gardening: with the theory of Draining Morasses, and with an improved construction of the drill plough. By Dr Darwin, (Dublin edition, price three dollars and fifty ets.)
Darwin's Botanic Gardeu—(price three dollars, a fine,

correct copy.

The Horticultural Repository, containing Delineations of the best varieties of the different species of English Fruits; with delineations of its blossoms and leaves, in those instances in which they are considered necessary, with descriptions and colored drawings of all the prominent Apples, Apricots, Cherries, Currants, Figs, Filberts, Gooseberries, Grapes, Melons, Nectarines, Peaches, Pears, Pines, Plums, Raspberries, Strawberries, Nuts, &c. By George Brackshaw, author of the "Pomona Brittannica."-In 2 octavo volunies, with 104 large colored engravings-price \$7 per volume. The original cost of the work was \$32,00.

Tall Meadow Oat Grass Seed.

This day received at the New England Farmer Seed Store, 52 North Market street, 20 bushels of Tall Meadow Oat Grass Seed, at \$2.50 per bushel.

Asparagus Roots, &c.

Asparagus Roots, 2 to 4 years old, 75 cents to one dollar per hundred. Rhubarb Roots—the large Dutch Currant Bushes, one dollar per dozen, Grape Vines, Hawthorns, &c. &c. Any of the above roots, that may require it, will be well packed in moss, to ensure safety in their transportation.

Published every Friday, at \$3 per annum, payable at the end of the year—but these who pay within sixty days from them of subscribing, are entitled to a deduction of fifty cents.

Primed for J. B. Russell. by I. R. Burss—by whom all descriptions of Printing can be executed to meet the wishes

COMMUNICATIONS.

FOR THE NEW ENGLAND FARMER.

COMPARATIVE STATE OF THE SEASON MR EDITOR-I have purposely delayed this customed publication, in order that it may be andered more complete. I have been induced to do it, because persons who keep no minutes have been led into the very erroneous opinion, that 1 ... season is late beyond any former example. 1 have more than once remarked in rendering the annual accounts, that the difference between what is called an early and late season is practically very small-that if vegetation is delayed, nature pop sesses powers to remedy the defects-that the difference between one season and another is every day diminishing as the season advances, and , more than one or two days, between an early season and a late one. The disastrous season of classed among the early ones. 1816, which I have often remarked cost more to Massaehusetts, and Maine than the whole expenses of the last war, is of course to be excepted. As the present season has been the object of special notice, I shall make my comparison more full and complete, at the risk of being deemed too minute. I repeat, what I have often said, that this is a comparison, not of my trees and plants with those

little value,) but of the same trees and plants in the same spot, throughout the whole period. 4 L'iz et ting of a mess of asparagus, fron the

It will be thus seen that the lateness of the the close of May there is rarely a difference of spring had very little effect upon the apple tree, and that the present season as to that tree must be

GENERAL REMARKS.

The peach tree has suffered extremely from Massachusetts to New Jersey. In the latter State an intelligent cultivator has lost a crop for which he was offered 4000 dollars. It has been as fatal to the vine, where it was left exposed. The promise of the pear tree 's smaller than usual, and in some estates it has failed almost wholly .-The promise of the apple is not great, though it is too early to decide with confidence. Grass has set well, and the perspect of a very abundant eroy, must be taken as an offset to the deficiency of

fruit. The promise of cherries is a fair one. Roxbury, May 17, 1829. J. LOWELL.

FOR THE NEW ENGLAND FARMER.

LOSS OF CUD IN CATTLE.

Ma Fessenben-The writer, who has read a little and werked a little, and moreover raised and

There is, however, some difficulty in this, as Mr S. speaks of "the opinion of farmers and graziers, that eattle do sometimes lose their eud," &c. as a matter of ridicale. In which latter opinion he (Mr S.) unites, and offers an ingenious argument to show how inconsistent it is with sound reason and common sense, as well as general ob: servation, that ruminating animals that are in 4 oz. of crop from the two cut potatoes. The health should not possess the faculty of raising largest weighing 15 oz.; and 6 lbs. 10 oz. from their end whenever they are inclined to chew the whole potato. The largest weighing 13 oz.

The philosophy of opinions will be lightly adverted to. Mr Stevens' neighbor gave good adveice i.e. when a "cow had lost her cud, to procure out from what might have been made by Mr one, or a substitute for one." Though Mr says Stark. The row was 39 feet long. The whole his did not give much credit to us hypothesis." potato was planted in the middle, a space of four feet intervening between it and the pieces on each the content of the c to his good sense a experience. To trust to na-ture in the cure of all rase and difficulty, is some-4 feet 3 inches long, as the cut pieces on each side times well; but too great a confidence in this principle has produced many cyls in worldly af-

* See p. 337 of our current volume.

The Editor's remarks and quotations as to "the loss of the and," are well. It seems as if it was indeed a " local disease." But the means of curo proposed by foreign writers, are too complicated, such as no farmer would be likely to have. They would require an apothecary's shep, " aloes, camomile, hear med, &c. How the throat or stomnell may affected in the case of "the loss of the cud" (so neal it is immaterial to inquire, as to any practice of the remedy, experience furnishes, yeeal very simple, and always at hand for the farmer. In nearly a score of instances I have by pring a frog into the throat of the animal, by or using the mouth and passing it below the grides, produced immediate relief.

I, too, take depended upon nature, so far as that a fine young animal was so reduced as not to be able .. be removed 40 or 50 rods, only but by a board being placed under him, with a man on each side as supporters. The frog (for delieacy's sake, a speckled one) was placed as before mentioned. In a few moments the jaws were in motion, and in a very little time the animal began to crop the grass, and was as it were forthwith well!!

But though my success has been perfect in every instance, (except as relates to the unfortunate frog) I yet do not consider even this sacrifico as absolutely indispensable. I have seen and known several instances of success by the use of a small piece of salt fish. Others may from different resolutions find equal relief. But when we can be resolved and equal relief. But when we can be resolved as a cld preverb not to strive to do better. With much resolved peet for your correspondent, I am, sir, yours, May 20, 1829.

FOR THE NEW ENGLAND FARMER.

POTATOES.

MR FESSENDEN In the American Traveller of the 12th inst, I have observed an article on the kept, for about half a century, as many horned the 12th inst, I have observed an article on the cattle as most of our farmers, begs leave to offer culture of potatoes, from Caleb Stark, of Dunbarto Mr J. Stearns, Jr, of Pawtucket, the result of ton, which corroborates Mr Quiney's experiment, an account of which was published in the American Farioer, vol. ii. page 294. Mr Stark says be made a trench in his garden 39 feet long; that he planted one potato weighing 13 oz. in the middle, that he then cut two potatoes weighing 8 oz. each, into 53 pieces, and planted them in the trench 6 inches apart, beginning at 4 feet 3 inches from the whole potato on each side. The result was 46 lbs. 4 oz. of crop from the two cut potatoes. The Mr Stark merely gives the facts, and says he abstains from further comments. I will suggest those which occur to no though probably different from what might have been made by Mr 4 feet 3 mehes long, as the cut pieces on each side would occupy, with their roots at least half the space intervening between them and the whole potato, if not more, as they would be restricted in room on the other side. The cut potatoes then

each end of the row, for the extension of their roots. We then have 38 feet 3 inches as the ground occupied by the cut pieces, nine times as long as that occupied by the whole potato. The whole potato produced 6 lbs. 10 oz.; which multiplied by 9 would give 59 lbs. 10 oz. The cut potatoes produced only 46 lbs. 4 oz. leaving a deficiency of 13 lbs. 6 oz. An acre planted in this manner in rows three feet three-tenths of a foot apart, would give 13.200 feet of rows. The produce of an acre of cut pieces yielding at the above rate would be 228 bushels, at the rate of 70 lbs. to the bushel. The produce of an acre of whole potatoes yielding at the above rate would be 294 bushels, difference of crop in favor of the whole potatoes 66 bushels. It would take about 6 bushels of potatoes to plant an acre in the above manner with pieces, and 36 bushels to plant it with whole potatoes, leaving a net gain of 30 bushels of crop seed being deducted. This accords with an experiment I made some years since, communicated to you, and the result I then came to, was. that if potatoes were plenty and cheap in the spring, I should plant whole ones-if dear, then I should cut them. NO THEORIST.

Ellsworth, Me. March 22, 1829.

Remarks by the Editor .- A note from the author of the above (which we hope he will excuse our publishing) informs that he is about making experiments on the subject of seed potatoes, &c., in which he will "try one of seed ends, root ends, middle pieces, and whole potatoes, the result of which shall be communicated to you. As I am neither the champion of whole, or cut potatoes, seed ends, root ends or middle piec e experiment shall be fairly made. One experiment, however, is not sufficient to establish which is the best. nor even a number of experiments in the same year; different seasons, whether wet or dry may give different results. Those interested in the deeision of this interesting agricultural question, are challenged to a course of experiments for three years, the result to be communicated to you."

We are much gratified in observing so much enlightened zeal in so good a cause, and hope the party "challenged" will not shrink from the amicable contest.

FOR THE NEW ENGLAND FARMER.

WORM OR BORER IN APPLE TREES. Mr Fessenden-I have read your useful paper for a number of years, and do not recollect reading much about worms in apple trees. I have from three to four hundred apple trees on my farm, principally young ones, and have taken all possible pains to cultivate them; but am almost discouraged. I should think nearly two hundred of them are infested by those unwelcome visitors. If any one can give some information how to commence war against them, I should be exceedingly thank-

By giving this a place in your paper you will very much oblige one of your subscribe; JOHN WALES.

Remarks by the Editor .- The worm above men-

occupied a space in the trench 34 feet 9 inches says, "You state that it leaves the pupa, and be- ture to lay the following experiments and their relong; to this I add one foot nine inches more at comes perfect in the latter part of April, and that sults before the Society. the eggs are deposited beneath the surface of the These two circumstances ascertained, I would recommend the application, early in May, For several years my crops of onions were nearly or the latter part of April, of common brick layer's mortar, around the base of the tree, so as to on about their roots at various stages of their cover completely the part, and its immediate vicinity, where the deposit is made. This preventive was successfully employed by Mr Shotwell, they were beginning to form a bulb, and even against the attacks of the peach tree insect (see American Farmer, vol. vi. p. 14,) and I see no reason why it should not be equally efficacious in by the onion blade assuming a glaucous green colthe preservation of the apple tree."-Mem. N. Y. Board of Agriculture, vol. iii, p. 479.

Previous, however, to any attempt to guard against the ravages of a future generation of these insects, it will be necessary to extirpate those which now infest the trees. The Mass. Agr. Repos. vol. v. p. 360, contains a paper on this insect, by John Prince, Esq. by which it appears that worms of this kind are got rid of "by digging round the tree, and clearing away the earth to the roots. and then with a sharp pointed knife, a chisel, or a gouge, (and a small wire to probe, if they are deep in the tree,) they may easily be destroyed." After taking out the worms, the wounds should be covered over with grafting clay and a large proportion of dry wood ashes mixed, and the earth then returned to the tree. The process for cleansing the trees from borers should be performed in of any infectiou. My first experiment I made on the spring, as soon as the frost is out of the ground, or at least before the month of June, as the perfeet insect escapes before that time.

A writer for the New England Farmer, vol. iv. p. 289, advises as follows: "The last of May, or early in June, remove the earth from about your trees that are attacked by the borer, and rid the tree of the insect as far as you can do it without lacerating the bark too much. As soon as the body of the tree is dry where the earth had covered it. apply two good coats of white wash (clear lime and water) from the insertion of the great roots to about a foot or eighteen inches above the earth when it is replaced. Let this be done every summer at the same time, and I think great advantage will be derived from it. I do not mean to say that you must not go higher than eighteen inches, if you have time and money to spare; for I believe lime to be very useful if applied in the form of white wash to the whole body of the tree. the first of June, or earlier, if the weather be warm, as it destroys the insects, of which great numbers always lodge in the cracks and openings of the bark, and make their way under it, if not removed in season. It is, however, best, if it can be done, to scrape the rough bark off before the wash is applied, by which means you remove the shelter as well as the insect itself, and prevent others harboring in your trees."

From the Transactions of the London Hort. Socie

On the Use of Charcoal Dust as a Top-Dressing for Onions, and as a Cure for the Clubbing in Cab-bages, &c. Communicated in a letter to the Secretary. By Mr Thomas Smith, Gardener to Matthew Bell, Esq., F. II. S. at Woolsington, Northumberland.

SIR-Having seen some papers in the Transtioned, is, probably, what is called the Apple Tree actions of the flort. Society upon the cultivation Borer, Saperda bivitata. Professor Say, of Phila- of onions, but none that took any notice of a disdelphia, in a letter to Jesse Buel, Esq. of Albany, ease to which these roots are very subject, I ven-

The garden I superintend is a very wet, stiff soil, upon a strong clay, and without any declivity. all destroyed by a grub, and by mouldiness coming growth; sometimes when they were about the size of what we call scallions, at other times when when the bulb was formed. As soon as the discase takes place it may very readily be perceived or, but very soon after changing to yellow, and the leaves at the same time rather flag. I tried various quarters in the garden, and found that there was a difference in them, some of them producing more of the disease than others. I also tried several experiments to prevent the disease taking place; but none had the desired effect, until I made use of charcoal dust spread upon the top of the ground intended for onions, about half an inch thick, before the seed is sown (the ground being previously well dug and manured.) and merely scuffled in with the point of a spade, so as to mix the top soil and charcoal dust together. Nothing more is after required beyond managing the erop in the usual way.

For these last six years I have had most excellent crops of onions, and not the least appearance a bed fifty feet long and five feet wide, prepared in the usual way, one half the bed was dressed with charcoal dust, and the other half without it. the part on which the dust was laid had an excellent erop of onions, it remained quite clean and free from any disease, while the part to which the dast was not applied was entirely destroyed by the grub and by mouldiness.

I subsequently resolved to try the effects of the dust on a larger scale; I therefore had the whole of the quarter prepared for onions, and divided it into eight beds of the same size as before; four of the beds were treated with dust, the other four remained without it. The result was the same as before, the heds where the dust was applied bore a good clean crop, whilst the others were affected. Having had two years proof of the good effeets of charcoal dust in preventing the disease from taking place upon the onion in one quarter, I have since tried it upon different quarters, with the best specess.

The charcoal dust ought to be kept quite dry, which is easily done by placing it in a round heap, and eovering it closely over with turf till it is

I have also found that the application of charcoal dust effectually prevents the clubbing in the routs of cabbages, &c. I had been accustomed to use lime fresh from the kiln for that purpose, and always with considerable advantage; but since I have made use of the charcoal dust upon different quarters of the garden, and any of the Brassica kind has subsequently planted there the clubbing bas entirely disappeared. I planted, some time back, a quarter with cauliflower plants, which never arrived at maturity, being very much injured with the club. In the spring of the following year I had the same quarter prepared for onions, with charcoal dust upon it; as soon as the onions were cleared off in October, I had it well dug over, and planted it immediately with early cabbages, which all arrived at maturity the ensuing

spring, without the least appearance of club-

Remarks by the Editor of the N. E. Farmer .-Charcoal is not only useful as an antidote against insects, but is a valuable manure. Dr Deane stated that he had long observed where coal kilns have been burnt, the ground has discovered a remarkable fertility for many years after; and more especially when it has been a cold and wet soil .-The dust of the coals, and that of the burnt turf have conspired to produce this effect. Hence, I have concluded the small coals, or the dust from coal kilns, spread over sour meadow lands would answer the end of a good manure. Being extremely porous, the pieces of coal imbibe much of the superfluous water, as well as increase the heat on the surface, as all black substances do. And when the weather becomes dry, they discharge the moisture, partly into the soil, when it grows dry enough to attract it, and partly into the air by the action of the sun upon it.

It is stated in the last Philadelphia edition of Willich's Domestic Encyclopedia, vol. i. page 655, that "a friend of Dr Mease informed him, that some years since, nearly all the cucumber and inclon vines in New Jersey were destroyed by a fly or bug. One day he had occasion to ride past a miserable but in the woods, and perceiving a very flourishing patch of encumbers, he was induced to dismount and examine it. On approaching the spot he found it had formerly been a charcoal heap. He took the hint, and by strewing powdered charcoal round about the vines, when they first come up preserves his cucumbers effectually."

DECAY OF TREES.

An opinion has been advanced, that the general decay of the Lombardy poplar in this country was owing to the circumstance of its being cultivated from cuttings, and not from the seed the principle being assumed, that a tree, so raised, will not long survive the natural life of the parent stock. The same principle is applied to grafted trees. To this theory, and of course to the consequence derived from it, we, on another occasion, expressed our dissent. We have seen no reason to alter our opinion. Still, as it is a controverted point, and one which may, ere long, be of importance to cultivators of fruit, and of ornamental trees; we should like to turn the attention of the public to the subject, in order to draw forth such facts as may have fallen within the observation of any one, having a bearing upon it.

The Lombardy poplar was introduced into the Middle States, many years before it was in this vicinity, and we very well recollect, as much as fifteen or twenty years since, while they were yet in full vigor and luxuriance here, of hearing a man from New Jersey give an account of their decay in some parts of that State, which exactly corresponded with the appearance which the trees now present in this vicinity. If the principle assumed be correct, should not the decay have been simultaneous, or nearly so? Another fact which may have some bearing upon the subject, is, that the Balm of Gilead, which belongs to the same genus with the poplar, is very generally decaying in the same manner that that tree does. The native poplar, also, in many places, presents a similar appearance.

It has been said, we think by the Editor of the

found, where the poplar has grown from cuttings, for several years past. Is it true that attempts have been made to cultivate it in that way, which have failed? Or, has the tree fallen into such bemp or flax is broken by the machine, and if undisrepute that no attempt has been made to propagate it? If any of our readers can furnish us days, dried, and again run through the machine. with any facts to this point, they will be gladly received and laid before the public. We have a number of cuttings, from a very old and decayed tree, which now look healthy and vigorous. How long they will continue so, remains to be ascertained .- Mass. Spy.

From the Taunton Advocate.

CATERPILLARS.

BROTHER JONATHAN-Your attention will soon be put in requisition to destroy the caterpillar-that most destructive enemy to the well doing and beauty of an orchard. A few more warm days will bring them forth in numbers sufficient to destrov the foliage, and consequently a greater part of the fruit. But fortunately, there is hardly a grievance without its remedy-which is in watching your trees daily, for a short time, and when you see the caterpillar nests forming, to twist them off with the famous Pickering brush, made fast to a long pole. This brush was invented a few years since, by the Hon. T. Pickering, of Salem, and the construction is very simple and effectual in the object designed. Now I am thinking, and I will venture to write it, that if your sous, and your neighbors' sons, will furnish themselves each with a long pole and one of those brushes, on Election day, and do their utmost to destroy these destroyers, they will be doing a good deed-altogether better than to murder the thousands of little innocent birds, that is in contemplation on that day. If the towns in the State would take the matter in hand, turn out en masse, for two hours on three successive days, and follow this practice for three years, there would not be a caterpillar in the State. A thing so desirable is not likely to take place, therefore individuals must do their best to protect their own orchards, and leave the general destruction to some future generations to accom-

The history of the caterpillar is very well known -and from that knowledge I have no hesitancy in averring that the annihilation of that insect is made easy. But it must be done in the month of May-their nests, together with the contents, must be taken off the trees and rubbed under foot. If they are suffered to remain undisturbed till June, it will be out of the power of man to effect much towards their destruction-for they begin at that time to leave their nests and scatter upon the trees, having nearly acquired a full growth.

It is not only necessary to examine every apple tree on your farm, but also every other tree that seems to be the favorite of these vermin-the wild cherry tree stands first in their estimation, after the apple tree. VERITAS.

Taunton, May 14, 1829.

HEMP MACHINE.

Hines & Bain's machine " is so constructed as to operate 112 times on every inch of the stem; and when running at full speed, rising of 200,000 flutes operate on hemp, or flax per minute, in sufficient force to crack and dislodge the stem. and at the same time, preserve the coat or fibre unimpaired. When well tended it will break 300 flea-bane in some places.

Massachusetts Journal, that no instance can be pounds of hemp or flax in an hour." This machine has been tried in New York, Vernont, Ohio &c., and according to the certificates published in the newspapers, is everywhere approved. The rotted, the fibre is then immersed in water a few which makes it fit for use,

The Hon. Samuel Lathrop, of West Springfield, in a communication in the N. E. Farmer, says, the hemp raised in his neighborhood, when well dressed, commands in market the highest price of the best Russian hemp-from \$10 to \$12,50 per hundred. He lets out his land upon shares. and in one instance, received more than 45 dollars an acre clear profit. The price of other agricultural products is so low, that he thinks it deserves the consideration of farmera in different parts of the country, whether their interest does not require them to turn a part of their land, and to anply a portion of their labor, to the cultivation of hemp. The hemp in West Springfield has hitherto been water rotted, and dressed by the brake and swingling board .- Hamp, Gaz.

A dentist in New York has invented an instrument which he calls the "patent lever tooth extractor." It is said to draw teeth with very little pain. Those whose teeth give painful evidence of a necessity of "reform,"-we mean, of being "turned out," will hail with gratitude the discovery of any incans of performing the disagreeable operation, with more than customary delicacy : for no one sees, without a pang, these faithful servants dismissed from office-even though their place should be immediately supplied by that friend of such new appointments, Mr Plantou .-The fact is, we know, when they are dismissed, that they have been so long in that particular service, the 52 fit for no other; and apprehensions are entertained, not without cause, that those which succeed them, may rather take their place than discharge their duties. Troubles frequently arise, we are aware, by painful experience, from old incumbents; but gratitude for services done. and a fear of hurting our own feelings by ejecting them, often induce the sternest of us to retain them in their situation, against the opinions of our constitutional advisers. Nay, we even support their relicts when their services have ceased though we are aware that such lenity must be offensive to those who approach their particular department .- U. S. Gazette.

Prince's Botanic Garden, at Flushing, L. I .-There are few persons who have not heard of this establishment, and perhaps few who know its extent. It covers more than forty acres and contains about ten thousand species and varieties of trees and plants. The green house contains from twenty to thirty thousand plants in pots. In the collection of fruit trees there are 287 varieties of apples, 290 of pears, 98 of cherries, 183 of plums, 33 of apricots, 197 of peaches, 407 of grapes, 10 of quinces, 57 of gooseberries, &c. There are 601 varieties of roses, which occupy an acre of ground. The whole establishment requires the constant attention of about 40 gardeners .- Salem Observer.

Essence of Pennyroyal, recommended at the south as a preventive, will cause musquitoes to keep at a respectful distance. This herb is called

By George N. Baigos, Esq., Vice President of the Society.

Blessed with health, surrounded with plenty. and in the midst of smiling peace, we have assenbled to conclude the ceremonies of the seventeenth anniversary of the Berksbire Agricultural Society. The degree of success which has attended the progress of this Society, must be a subject of high gratification to those of its early friends who recollect the time and circumstances under which it was established.

We all remember that stormy period of our own time, when the torch of war blazed throughout the continent of Europe, and the fairest portions of her seil were broken and torn by the hostile hoofs of the foreign war horse. In our own country, political discord so agitated the public mind, that the very elements of society were thrown into fearful commotion. All the better feelings of the heart gave place to suspicion and distrust. The lines of party were drawn with such exact and frightful precision, that the ties of social intercourse were rudely sundered, and neighbors, and friends, and families, were placed towards each other in the attitude of perpetual belligerents. The hideous monster of disunion stamped the impress of his cloven foot in the very sanctuary of religion, and placed in the hands of its prefessors the weapons of party warfare. The spirit of improvement which dawned upon the age, was threatened to be overwhelmed and destroyed by the all-absorbing spirit of the day.

At a time, when under circumstances like these, a number of patriotic individuals of our own county originated the project of a Society, whose object should be to restore and promote acial intercourse among the members of the community; to improve the condition and add to the wealth of the farmer and mechanic, and more effectually develope the natural and artificial resources of the country. Foremost amongst them stood the Hon. ELKANAH WATSON. The subject was presented to the citizens of Berkshire, with the expression of an ardent solicitude that it might be favorably received. They listened to the proposition, and dotermined to give it an experiment. The interesting exhibitions and transactions of the first meeting of the Society gave assurance to its friends that their designs and hopes might in future be realized. Though too young at the time to have participated in its concerns, the speaker with pleasure embraces this opportunity of congratulating those patrons and friends of the Society who embarked in its cause, when the result of their efforts existed only in auxious conjecture; who through every period of its existence have yielded to it their cordial and undivided support, and who are present on this occasion, witnessing the fruits of their labors.

The permanent benefits which have directly and indirectly flowed from this institution to almost every class of people in the county, are so identified with their present prosperity and future well being, that to question its reality would be to doubt the evidence of our senses. Let him who look abroad over the face of the county, and contrast its present agricultural aspect with what it ued, talented, and honored citizens of our Repub- pect a crop without any further attention. These was at the time the Society commenced its opera-lic. In their origin and progress, they have given men will never derive either pleasure or profit tions. MAY.

The sluggard is known by the neglect of his But it would be unjust in us, and ungenerous garden. In a tentive to the proper season of plantwhich we are speaking, are confined within the without art, sows his seed "by the way side." His hesitates to acknowledge its salutary influence, formed, and enrolled among their founders, and take much pains to manure and make their garsupporters, and officers, the names of the most val-den, and then desert it altogether, seeming to exthat when his garden is planted, although it may be done in the most skilful manner, his care and labor is but half accomplished. It is folly in the extreme, to plant a garden, without a full determination to protect it from weeds and insects.

All horticultural plants are feeble in their origin, and most of them continue so a length of time. Care must be taken that they do not stand too thick, and starve for want of food and air; and it would be equally improper to have their ranks too thin, and any considerable portion of the ground, with which you have taken so much pains, tie waste and unproductive. Besides all this, the health and vigor of your plants require that the ground around them should be often stirred and palverized. And here the appearance of weeds may be properly considered as timely monitors, that your vegetable infants want the hosom of their mother earth raised and opened for them. Without them we might forget that plants, as well as animals, must have their daily food, and that in proportion to their wants or cravings, or they must certainly become stinted, feeble, and unfroitful.

If showers are frequent, the earth settles and becomes firm and unvielding around their stalks, and requires as frequently to be moved and loosened; if the weather is dry, stirring and making the soil fine will do more to prevent the injurious effects of drought, than the most copions artificial watering. Indeed artificial watering is seldom useful, and waen applied injudiciously is always hurtful; but if your ground is not too wet, you can never hoe or stir the surface without advancheapest mode of tillage. We had rather hoc three times than once.

put in good order, and the roots of weeds are not permitted to gain strength with age, a very trifling attention and labor will effectually prevent them as Hibbert, who, in the year 1822, brought these from starving and injuring your garden. In a each two feet high, from London, in the vicinity particular manner do not permit weeds to stand in the neighborhood of your plants in very dry weather, for they are generally strong drinkers, and will imbibe all the moisture within the reach of their roots, while your tender plants are drooping and sickening for want of it.

PENNSYLVANIA HORTICULTURAL SO-CIETY.

At the meeting held on the evening of April 4th, the Society was favored with two bottles of currant wine, made on Pont Reading Farm, in 1825, presented by Miss Humphreys. It was considered a very good wine, but a little overcharged with sugar. A valuable communication was received from Edward II. Bonsall, of Germantown, patriotic fellow citizen Elias Durand, was received upon the best mode of ripening wine for use, in ed. and a portion of it distributed. The remainwhich both from theory and experience, he shows " that current wine as strongly requires age, and is as certainly benefited by it, as that made from the grape;" he adds, " In fact, as there is generally more saccharine matter in it, it must require a still longer period to complete the vinous process, which I consider is still going on until a wine which was at first comparatively sweet, has arrived nearly at a state of dryness. E. aporation and deposit will equally take place, and with the same beneficial tendency as in other wines." Regarding wines in general, he maintains the position, that there is a limit to their improvement, the leaves are extensively used for feeding eattle which is attained in much less time than is gen-

"The nran of understanding" knows full well crally supposed, especially where wine has been kept in a suitable place for ripening.

before exhibited. His collection of this flower is ling melody, is not a frog according to modern natvery extensive.

Messrs Landreths brought forward :

Azalea indico, two sp: the flowers of the one large and single, of a fine scarlet; the other producing clusters of compound florets, the color light purple, assuming a darker shade by candle light, much larger than a comm n cricket; but its

specimen is now in bloom at Mr Hibbert's, Thir- londness of voice, which is a shrill whatle, and teenth street, near Lombard, by whom it was in- may be distinctly heard at the distance of a rolle.

of this a beautiful specimen was exhibited, having and live on the trees and shrule during the sumon it a number of buds and full blown flowers; this plant withstands our winters unprotected, and would form a valuable acquisition to our city gardens. Messrs L. have twelve varieties of superb Posonias, in their collection, all hardy. A specimen of a beautiful Indigofera in full bloom-also, lxia, Enpatorium, elegans Amaryllis Johnsonii, large crimson flowers, with light colored longitudinal stripes; this sp. is considered one of the most splendid of the Amaryllis tribe—also, Rhododendron arberea ulgida; this is thought to be one of the most magnificent plants yet introduced into this country; the flowers as in all Rhododendrons, are formed in clusters at the extremity of its branches-those on this plant were about the size of those of Rho. maximum-color, mest brilliant crimson; this plant flowered two years since, with Messrs L., and was supposed to have been the first blooming in this country; it is a natage. Besides, frequent hocing is the easiest and live of the mountains of Nepaul, in Indostan, and it is hoped may prove hardy enough to stand in the open air, in which case its value will be much If previous to planning, the ground has been enhanced to those who do not possess green-

We also owe these elegant plants to Mr Thomof which they grew from seeds sent from Nepaul. The plants severally bear white, purple, and scarlet flowers. The species now in bloom, flowered in 1827, and 1828; the other two have not yet flowered.

An improved planting machine invented by A. 11. & Levi Robbins, Jr. Denmark, Lewis County, New York, was examined and thought to be a useful invention. It is highly recommended by many farmers who have used it in the State of New York. This machine, which is patented, is left for examination at the store of D. & C. Landreth, No. 85 Chesnut street.

A quantity of perennial cabbage seed, imported from France, and presented to the Society by our der is placed with Messrs Landreths, by whom it will be distributed to applicants. The seed should be sown thin, and the plants set out in October, 20 inches apart, to remain out all winter. This is the practice in Maine and Brittany, but in this eountry a cover may be found necessary. The leaves are to be used the following spring, as leaves on the top. After November no more leaves are to be pulled, but the young sprouts

The little reptile commonly known by the name of peeping frog, which is now eausing our swamps A Parker produced 12 varieties of daisies, not and meadows to resound with its spring proclaimuralists, but a nondescript species of Hyla, or tree toad. Our common tree toad, the Hila versicolor of Le Compt, is much larger, and of habits entirely different from this.

The peeping frog, improperly so called, is not This Azalea is a native of China. Another smallness of body is amply compensated for by its They pass the winter in the mod of our swamps Peronia montan, v rosea (Chinese tree Peronia,) and ponds; deposit their eggs there in the spring. mer months. The power of changing their color at will, and in conformity to that of the substances on which they happen to be situated, which is enjoyed in common by all the species of this genus, is possessed by the peeping frog in a degree equaling, if not surpassing that of the chamelion.-They are very expert in-ect catchers, and greatly assist our feathered friends in clearing our fruit trees of noxious insects. They are furnished with a mucous tubercle at the end of each toe, which distinguishes them from the frogs and toads, and gives them the power of climbing and adhering to the most polished surfaces. They make their appearance very early in the spring, generally about the 20th of March, and have on this account named the species, Hyla vernalis .- Worcester Yeo-

> Advice Gratis .- A few days ago, we heard a hearty and thrifty looking farmer inquiring, in a store in State street, if the gentleman knew of a place in a store, where he could put one of his sons. At the risk of being thought importment, we asked the farmer if he knew of any place in the country where a boy was wanted to turn up the sod. He said he did not then; he himself wanted a hand a while ago, but he had hired this man, pointing to his companion, a hale, hearty man of thirty-five. This led to some further conversation, in which we learned that the farmer thought it best to send his sons into the city, to learn to trade, particularly if they were not of stout constitutions, and supply their places by hiring men to work on his farm.

In this opinien the honest farmer is by no means singular, but we apprehend that the advocates of his doctrine lie under a sad mistake. The love of speculation and the hopes of accumulating an independent fortune, or, at least, a competency, without active personal labor, are the curse of New England. To country boys at fifteen or sixteen, the difficulties of trade and the dangerons uncertainties of shopkeeping, are inconceivable .-They see nothing but ease and happiness in the employment of the well-dressed clerks of the counting house, and forthwith they must leave the farm, where money is turned up in every furrow, and health sparkles on every blade of grass, to throw away half a dozen years of the spring of life behind a counter. Their minority is closed; and they must then enter upon the world with lit wanted, always observing to leave five or six the or no improvement in their moral, intellectual, or physical habits; with no capital but their integrity and good name (if luckily they have been used which appear in the place of those detached. able to pass through such a dangerous apprentice-The cabbage stalks last 4 years in France, and ship without the loss of these qualities) wherewith to commence business, and with the knowledge of no profession but one that is full of competi-

tors, and which offers them no prospect of independence. The city is crowded with shopkeepers, and there is no branch of what may be called trade, that is not overdone. If a young man obtains credit for a small stock of dry goods, or hard ware, or groceries, ten chances to one he is unable to meet the first payment, and if he should be so fortunate as to have turned his stock and made a small profit, by the revolution, the second or third period of payment finds him unprepared, and he must either clear out (as the phrase is) and seek a living at New York, or some other remoter place, or he must write "AGENT," under his name on the sign, and struggle with his debts and his bad luck a little longer. The result of this latter am now enabled to give a more extended hisarrangement needs not be told. Every hody knows tory. how few of those who fail ever recover from the shock which broken credit produces, and how hard it is for an "agent" of this description ever to recover the character of principal.

How happy would it be for hundreds and thousands of our young men, if they could be persuaded that a few acres of ground are a better capital than as many thousands of dollars, procured by writing their names at the bottom of a negotiable note; and what years of miscry might be saved if men would believe that a dollar actually earned by honorable and healthful labor, as farmers and mechanicks, is worth a hundred in prospect to be gained in trade and speculation .-

Bost. Cour.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, MAY 29, 1829.

A COMPOSITION FOR GRAFTING.

In our paper of the 22d inst. page 337 we gave recipes for several compositions to be used in grafting, but were not then in possession of the following, which we are assured has, for some time, been used by Messrs Winships, at their valnable nursery, in Brighton, and by them preferred to any other.

3 parts rosin; 3 parts becs' wax; I part tallow. Melted and mixed while hot.

SPONGE BLACKING.

A friend has given us the following, as a good method to make sponge blacking. Take pulverised shellac, dissolve it in alcohol, in sufficient quantities to give it a proper consistency-then color it with ivory black. It is important that the shellac should be well dissolved; if necessary, giving it a gentle heat will hasten it.

DANDELIONS.

A correspondent of the Springfield Journal says, "Last summer I transplanted dandelions in June. This spring I have cut them three or four times a week, and must say they are a very superior article for the table-they occupy little room, and require very little attention. I make this statement now, as this is the season for transplanting them, and I know of no better green, nor anything more profitable for a small portion of a gardenthey are planted about six inches apart.

FOR THE NEW ENGLAND FARMER.

DISEASED PEAR TREES.

MR FESSENDEN-You may recollect my in-

Disease of Pear Trees, containing new discoveries, I had made the preceding summer on the origin and progress of that formidable and incurable disorder-or of a new one more destructive to the efforts of those engaged in a primary cultivation of this valuable tree. Having destroyed the minutes I had taken, I felt a reluctance at complying with your request of tasking my memory in a new draft. On noticing a recent communication from my intelligent and scientific friend, E. Hunt, Esq. of Northampton, on this subject, some prominent facts occurred to my recollection which may be important to him, and others, engaged in investigating this deplorable evil. In addition to these I

Some time, probably in July last, after supporting the stem of a pear tree for the purpose of trimming it, I found my fingers had been in contact with some viscous substance. On examination I found the wood enveloped in a fluid, which to the touch and taste resembled diluted honey. The leaves were also partially coated and glossy. On some the exudation was so abundant as to admit a collection on the point of my knife. By an exposure to the sun the granulation gave a roughness to the bark. The leaves became black in the affected spots, and gradually died and fell .-The wood by a longer exposure to the atmosphere resembled a leafless stick exposed to the smoke of a lamp. The bark was so embued that relieved by a gentle topping: but the sickly aspect of a great proportion of them demanded a bolder practice. I have cut them down to a healthy shoot, taking care that the place where severed is perfectly sound. An abundance of healthy looking sprouts are in vigorous growth .-Mr HUNT mentions the Brown Beurre as most particularly affected. Of the budded and grafted fruit in my nursery the Summer Bergamot has suffered most. A Golden Beurre, for many years in bearing, was the only adult tree on which I noticed the disease. Its foliage was conspicuously glittering in the sun. The leaves perished, and were prematurely cast: and the fruit fell either unripe or vapid. As the trunk appeared to be healthy, my only prospect for saving it was in cutting off the branches. The indications are favorable; still I consider it a doubtful case.

How far this disease of the nursery has any affinity with the pestilence which has destroyed the adult, and which for some years has called forth so many equally unavailing investigations and regrets, I shall not presume to determine. Still, leading symptoms are common to both cases .-There is, however, one very noticeable difference. stuff, it is suffered to stand a few minutes to settle,

they both prematurely fall. More minute and careful examinations must settle the question.

Most cordially your friend and serv't, Worcester, May 25, 1829. O. FISKE.

SAFETY BLANKET.

Mr Caleb Pierce, of this town, has invented a fire screen, which he has exhibited in Boston, to the satisfaction of every one, who has seen it. It is merely a canvas sheet to cover the roof, or the sides of a building exposed to the fire. The sheet on the upper edge, is provided with a canvas tube, into which water is thrown by the engine hose, and as the water percolates through, it keeps the canvas so wet as to resist the effects of fire. - Salem Observer.

CHEESE.

The milk is universally set for cheese as soon as it comes from the cow.

The management of the curd depends on the kind of cheese; thin cheese requires the least labor and attention.

Breaking the curd is done with the hand and dish. The finer the curd is broken the better, particularly in thick cheeses. The best color of this kind of cheese is that of bees wax, which is produced by Annotta, rubbed into the milk after it is warmed. The dairy woman is to judge of the quality by the color of the milk, as it differs much in strength. The runnet is prepared by taking neither torrents of rain, nor the friction of a wet some whey and salting till it will bear an egg; it cloth could restore the natural appearance. This is then suffered to stand over night, and in the disease, in a moderate degree, is known under morning it is skinumed and racked off clear; to the appellation of Honey Dew; but so rarely oc- this is added an equal quantity of water brine, curs, and with so little apparent injury, that I know strong as the whey, and into this mixture, some not that it is to be found in the nomenclature of sweet briar, thyme, or some other sweet herbs, also the horticulturist. The effect of so copious an ef- a little black pepper and salt petre; the herbs are fusion from the life-current of vegetation was to kept in the brine three or four days, after which be apprehended. Rows of trees which a year it is decanted clear from them. Into six quarts of since were in a luxuriant state of vegetation, seem this liquor four large calves' bags, or more propernow to be striken with death. The least vigor- ly called calves' stomaclis, are put. No part of ous have perished root and branch. Others that the preparation is heated, and frequently the had a healthy root, are starting again beneath the calves' bags are only steeped in cold salt and surface. Some, but a little discolored, have been water. Turning the milk differs in different dai-

heave, and cooling it with cold water produces a similar effect. The degree of heat varies according to the weather. The curd when formed is broken with what is called a treple cheese knife. The use of this is to keep the fat in the cheese; it is drawn the depth of the curd two or three times across the tub, to give the whey an opportunity of running off clear; after a few minutes the knife is more freely used, and the curd is cut into small pieces like chequers, and is broken fine in the whey with the hand and a wooden dish. The curd being allowed about half an hour to settle, the whey is laded off with the dish, after it is pretty well separated from the curd.

It is almost an invariable practice to scald the curd. The mass is first broken very fine, and then the scalding whey is added to it and stirred a few minutes; some make use of hot water in preference to whey, and it is in both cases heated according to the nature of the curd; if it is soft, the whey or water is used nearly boiling; but if however, I may hazard a remark that some of the hard, it is only used a little hotter than the hand. After the curd is thoroughly mixed with the hot quiries respecting a paper sent you in October In the disease most noticed and discussed, the leaf and is then separated as at the first operation. hist; and my statement that it was a treatise on and fruit perish and remain on the branch—in this After the scalding liquor is separated, a vat, or

what is often called a cheese hoop, is laid across the cheese ladder over the tub, and the curd is crumbled into it with the hands and pressed into the vat, to squeeze out the whey. The vat being filled as full and as firmly os the hand alone can filled as full and as firmly os the name and according to the curd of the vessel that is to European trees, executing the eak in height, and equalling it cloth is spread over it and the curd is turned out of the vessel that is to European trees, executing the eak in height, and equalling it cloth is spread over it and the curd is turned out of the vessel that is to European trees, executing the eak in height, and equalling it is both and extended. "It is used by the cabbet maker and conject—makes an excellent coppace tree for poles and boops of the hoop into the cloth; the vat is then washed and the inverted mass of curds, with the cloth under it, is returned into the vat and put into the press; after standing two or three hours in the press, the vat is taken out, and the cloth is taken off, washed, and put round the cheese, and it is replaced in the vat and in the press. In about seven or eight hours it is taken out of the press and salted, the cheese is placed on a board and a handful of salt is rubbed all over it, and the edges are pared off if necessary; another handful of salt is strewed on the upper side, and as much left as will stick to it; afterwards it is turned into the bare vat without a cloth, and an equal quantity of salt is added to it, and the cheese is returned into the press; here it continues one night, and the next morning it is turned in the vat, and continues till the succeeding morning, and the curd is taken out and placed on the dairy shelf: here they are turned every day or every other day, as the weather may be. If it is hot and dry, the windows and door are kept shut, but if wet or moist, the door and windows are kept open night and day. CLEANING THE CHEESE.

The cheeses having remained about ten days after leaving the press, are to be washed and scraped in the following manner; a large tub of cold sweet whey is placed on the floor, the cheeses are immersed in it, where they continue one hour, or longer if necessary, to soften the rind .-They are then taken out and scraped with a common case knife, with great care, so as not to injure the tender rind, till every part of the cheese is smooth; they are, after the last operation, rinsed in the whey and wiped clean with a coarse it cloth, and placed in an airy situation to dry, after of the cheese room is generally prepared by rubbing it with beam or potato tops, or any succulent herb, till it appears of a black wet color; on this floor the cheeses are placed, and turned twice a week, their edges are wiped hard with a cloth once a week, and the floor is cleansed and rubbed with fresh herbs once a fortnight. They must not lie too long, or they will stick to the floor .-This preparation of the floor gives the cheese a blue coat, which is considered of great consequence.

STILTON CHEESE.

The Stilton Cheese, which may be called the Parmesan of England, is not confined to Stilton and its vicinity, for many farmers in Huntingdonshire, and also in Rutland, and Northamptonshire make a similar sort, sell them for the same price, and give them the name of the Stilton Cheeses.

Fans for sale in Milton, of about 200 acres, remarkably well separated let it not be broken as is done with other cheese, but take it out, disturbing it as little as possible, and suffer it to dry gradually in a sieve; and as the whey separates, compress it gradually it has acquired a firm consistence, then place it in a wooden hoop and suffer it to dry very gradually on a board, taking care at the same time to turn it daily, with close binders round, and which must be tightened as the cheese acquires more solidity. SHOT, CAPS, &c. of the best quality-cheap for cash.

TO PREVENT CHEESE HAVING A RANCID NAUSEOUS FLAVOR.

Put about one table spoonful of sait to each gallon of milk when taken from the cows in the evening, for the cheese to be made the next day;

until the sait at the bottom of the versual that is to be said the said of the propose of introducing the culture of the trees into New bingland. Loudon describes this as "the most magnificent of the propose of introducing the culture of the trees into New bingland. Put about one table spoonful of sait to each prevent the milk from growing sour or putrid the coop hottest nights in the summer.

the corpulent, their exposure to ridicule should not be forgotten. Even the austerity of Queen Elizabeth could relax into a joke on the fat Sir Michael Relations about tendary since, and in good order for transplanting the country of the country the corpulent, their exposure to ridicule should Nicholas Bacon, whom she was classically pleased to define as 'Vir Præpinguis,' observing 'right merrilie.' 'Sir Nicholas's soul lodged well.' The good humored antiquary, Grose, was earnestly en-lete assortment of Crockery, China, and Glass Ware, are of-fered for sale, low, at No. 4 Dock Square. him!' 'God bless you Sir,' said the paviours to the enormous Cambridge professor, as he passed over their work. Christopher Smart, the translator of Horace, celebrated the three fat beadles of Oxford; and the fat physician, Dr Stafford, was not allowed to rest in his grave without a witti-

" Take heed, O good trav'ller, and do not tread hard, For here lies Dr Stafford, in all this church yard."

Our good King Edward IV, even made a practical joke with the Corporators of London; for when he invaded France, in 1475, he took care to be accompanied by some of the most corpulent Aldermen of London, 'Les bourgeois de Londres les plus charges de ventre,' that the fatigues of war might the sooner incline them to call out for

To School Teachers .- Never deceive your scholars, nor suffer them to practice deception.

Never promise what you do not intend strictly and literally to perform.

Never threaten what you do not mean, or what would be improper to execute.

Never tell your scholars, you will cut off their which they are placed in the cheese room. The floor ears, or say anything else you do not intend to do. Never shut up a child in a dark closet, or say

anything that will make him afraid of darkness. Never allude to mysterious evils, or threaten punishments from causes that children cannot comprehend.

Never speak to them about the Old Man, or the Old Woman, or the Old Harry.

The above maxims are worth the consideration of every well disposed person, who has intercourse with children, and the utility of abiding by them must be obvious to those who possess any share of consideration.

MISCELLANIES.

MY GIRLISH DAYS.

When I was young I loved the boys, And now I love the men; And O, to taste those artless joys, I'd be a girl again.

I'd ramble o'er each flowery field. Tu where the berries redden; Some lad should go with me to yield Kind offices embidden.

He'd bring each flower its head that rear'd, And help me o'er the brook; And when a pretty bird appear'd, Cry out, "Oh Jenny, look."

If a poor cow should frighten me, He'd drive her out of sight; And if a snake we chanced to see, He'd kill the beast outright.

And if in some unlucky fen I chanced to lose my shoe, He'd pull it out and wash it clean. · And my misfortune rue.

Arrived where berries deck the lea, Although I should not ask it. He 'd find the thickest spots for me, And help me fill my basket.

Should savey thorns my gown attach. He'd quickly set me free; And if my finger got a scratch, How sorry he would be.

And other joys I oft recall, That with my childhood fled. When Ceremony o'er them all Her chilling influence shed.

Twelve years had not passed o'er me then, And now I've seen a score-And O, I'd be a girl again, To taste those joys once more.

G. M.

THE INDUSTRIOUS CLERGYMAN-ROBERT ROBIN-

"That a minister of the gospel should thus devote himself to mercantile employments, was by many of his christian brethren construed to his disadvantage. But all illiberal imputations he submitted to without difficulty: and the only notice they received from Robinson, were smiles at their impertinence. "Gracious boobies," he would say, " too idle, many of them, to work, too ignorant to give instruction, and too conceited to study, spending all their time in tattling and mischief,are these the men to direct my conduct, to censure my iudustry?" His sentiments concerning such reverend busy-hodies may be collected from the following letter written to a worthy minister, Thomas Dunscombe, of Bampton, Cafordshire.

"Chesterton, Nov. 14, 1785."

" DEAR SIR-I own it gives me a great deal of pleasure to see any of the ministers of our churches address themselves to honest employments in life; there are many reasons to induce us to do so .there to find out? A eatholie had need be a

ligion hes in believing a few plain facts, and in imitating that very plain example, Jesus Christ,what hath he to do to rack his invention, and to assemble all apologies, ancient and mod-ern, to justify him for doing so? Oh! but there were some beautiful readings, and fine criticisms, and strokes of oratory, which deserve the study of a minister of Christ! Well, God forgive me, poor sinner that I am! I feel that three pounds, gained honestly, by the sale of a fat bullock, produce more fire in my spirit, than all those pretty, but poor tassels and spangles, can give me. With three pounds I can set fire to ten cold hearts frozen with infirmity, and widowhood, poverty, and fear. Half a guinea will purchase the native eloquence of a grateful old woman: and she, if I for eattle are too well known to need comment. set her to read, will give me a criticism of the heart, and the finest reading in the world. Oh! bless the old soul! what honeyed accents she pours into my ear! If I can honestly get, and afford to give away three pounds, it will always be my own fault, if I be not very happy. Now, then, set me to preach. How is it possible I should be dull. The luxury of living to the glory of God and the good of society; the joy of having saved a forlorn and forgotten cripple from hanging herself in despair; the felicity of setting fire to incense that othy, Orchard Grass, Oat Grass, Herds Grass, &c. burns to the glory of God; these are preparations for the pulpit, which the cold consumer of midnight oil never derives from his accents and quantities. I was the other night in our vestry with several gownsmen, just before the lecture. In comes one of my sister Abigails. "How do you do, Sarah? I am glad to see you returned safe from visiting your family at Soham." "Bless the Lord, Sir, I am. We heard Mr Watts on the Lord's day, and were very much edified indeed! But the day after we were coming out of town, my husband saw him-and poor creature he was so shocked." O Sir !-Thunderstruck at all this I trembled, expecting to hear that my poor brother Watts was seen drunk, or some such thing .-Lord, thought I, happy is that man who hath not a foolish, babbling, good woman in his congregation. I looked pale. Sarah went on, "O Sir, there was the poor man on the top of a ladder a thatching a rick." I laughed, but stamped, and said, have I bestowed so much instruction upon you and your husband for nothing? Are you yet in a state of infancy? I honor the man, and must he aequainted with him. "Dear Sir, he works five days, and has only Saturday to study." Well, Sarah, I shall try to convince him, that he ought to work six days: for one day will never make him a scholar, and his people are only a set of turf diggers: and fourteen pence more in his win, (Dublin edition, price three dollars and fifty cts.) pocket every Lord's day, will make him preach with more vigor, and pour the gospel with more power into the turf-men's souls. I appeal to these learned gentlemen." After all, the prejudices of the common people are very great against the secular employments of ministers; and while we next Apples, Apricots, Cherries, Currants, Figs, Fiberts, pursue them, we should take care, and not give cooseberies, Grapes, Metons, Nectanics, Peaches, any unnecessary offence. This last seed time I secular employments of ministers; and while we was in the field along with a young gentleman ca."—In 2 cetavoyalmes, with 104 large colored engravindex after my farm, and he was digging a

BEES.

MR FESSENDEN-In your 44th No. a writer fact observable in the economy of bees, which to his mind is inexplicable. This mystery is, how the bees in the month of March, before a tree or shrub is in bloom, or any signs of vegetation are manifested, can procure the substance resembling pollen, which they obtain from flowers and blossoms in their season. I make no pretensions to the appellation of a "curious observer," but if I am not greatly mistaken, the witch hazel is in blossom all winter. And Fessenden's New Garshrub, blooming in the month of March, loaded with flowers of delightful fragrance. It is as hardy as a shrub oak." And it is probable there are many other blossoms in the winter, that these sagacious and industrious insects can procure pollen from. May 25.

FOR THE NEW ENGLAND FARMER.

THE BISON.

MR FESSENDEN-I should like to be informed sults?

that the bison, from the extraordinary size of his bones, and the depth and formation of his chest is far superior to our domestic ox, for agricultural purposes.

I think it will be admitted that this powerful inhabitant of our prairies possesses a double portion of strength and agility compared with our domestic cattle.

We have been in the practice, since the first settlement of our country, of importing our neat through the medium of the New England Farmer, stock from Europe, frequently at a great expense, in relation to the subject. and have wholly neglected that noble animal, which formerly moved over the greater part of from the seeds? our country, but is now scarcely to be seen east of the Mississippi river, and will in a few years probably become extinct.

Yours respectfully,

Remarks by the Editor .- Willich's Domestic Encyclopedia says that the "Bison (Bos Americanus) is a large species of ox, with round and distant horns, which point outwards, a long and woolly mane, and a large fleshy protuberance on the shoulders.

" As they are capable of being domesticated, and in this state are sufficiently tractable for the purpose, they are sometimes rendered useful for agricultural labors. Their flesh is used as food, and the fatty protuberance on the shoulders is esteemed a great delicacy. The tongues which are reckoned superior to those of oxen, are frequently readers. transported to New Orleans, where they always have a ready sile. When these animals are quite that the laud here is a low, gravelly, heavy, moist caten raw; but stewed, or in pies, or tarts, along

I am, sir, very respectfully, yours, &c., JOSEPH W. CAPRON. . Ittleborough, May 11, 1829.

Remarks by the Editor .- There is not much in culture, which is nearly, if not precisely, the same as that of, the apple tree. Mc Mahon says "as soon as you find your ground in a dry state in the spring, sow the kernels of apples, pears, and quinces, to raise stocks for budding and grafting MR EDITOR-In the perusal of your well con- on: the sooi r this can be done the better. It

Prince 'n Horticulture states that "This tree thorn, &c. It flourishes best on a moist soil, where it produces the greatest crops, but will one another, would be advantageous."

Loudon asserts that the quince is propagated " generally by layers, but also by cottings, and approved sorts may be perpetuated by grafting. In propagating for stocks, nothing more is necessary than removing the lower shoots from the larger, so as to preserve a clean stem as bigh as the graft; but for fruit bearing trees it is necessary to train the stem to a red, till it has attained four or five feet in height, and can support itself up-4. Which season of the year should the seeds right. The quince prefers a soft, moist soil, and rather shady, or at least sheltered situation. It is seldem planted but as a standard in the orchard, and a very few trees are sufficient for any family. The time of planting, mode of hearing, and all the other particulars of culture are the same as for the apple and pear."

As the quince tree is smaller than the apple or pear tree, we presume quinco trees may stand nearer together than those other fruit trees, withuable information, in relation to the subject, which out interfering with each other. But the common may be thought beneficial or useful to the pub-practice is to raise them singly, in borders of garlie, would at least be acceptable to one of your dens, fields, lanes, &c. wherever chance or choice may place them.

"The fruit of the quince (says Loudon) is not

with apples, is much esteemed. In confectionary it forms an excellent marmalade and syrup .-When apples are flat and have lost their flavor, Forsyth observes, a quince or two, in a pie or pudding, will add quickness to them." Dr Willich observes "Quince trees are highly esteemed, as stocks on which pears may with great advantage be grafted or budded. This operation greatly improves the taste and flavor of those pears, which arrive at maturity in the summer and autumn ; but is by no means proper for winter fruit, which is thus rendered hard and stony. This fruit is generally boiled and eaten with sugar, in which form it may also be usefully employed in cases of dysafford a delicious wine. By boiling the kernels of mittee. quinces in water, a mucilage is extracted, which is often used in medicine, as a proper substitute for that of guin arabic. Quinces are excellent in apple pies, in the proportion of one-fourth quince to three-fourths apple, with some thin slices of candied lemon peel or citron."

MASSACHUSETTS HORTICULTURAL SO-CIETY.

The Standing Committee on Ornamental Trees, Shrubs, Flowers, and Green Houses, beg leave respectfully to report the following subjects for premiums, viz.

For the most successful cultivation of the American Holly; the number of trees, not less than four, which have been transplanted at least three years, the sum of ten dollars.

For the four best flowering plants of the Magnolia Glauca, which have been transplanted at least three years; the sum of ten dollars.

For the most successful cultivation of the Rhododendron Maximum, the number of plants not less than four, which have been transplanted three Max'n Isnard, chemist; formerly director of one years, the sum of five dollars.

For the five best plants of the Kalmia Latifolia, which have been transplanted not less than three years, two dollars.

For the best seedling plants of either of the above, not less than ten in number, of three years growth, and upwards, five dollars.

For the best specimens of Chinese Chrysanthemums, not less than five varieties, three dollars.

For the best half dozen of Tulips, do do Hyacinths, 2,00 do do Ranunculus. 2.00 For the best pot of Auriculas, do do Anemonies, 2,00 do do Pinks. 2,00 do do Carnations, For the best half dozen cultivated native flowers. For the finest Roses, not less than five va-

rictics, For the best bunch of double and single Dahlias,

For the greatest number and finest kinds of the Camellia Japonica, 3.00

Discretionary premiums to be awarded on plants, or flowers, not enumerated above, but no premiums will be awarded until the year 1830. Of the times when, and the places where, due notice will be given by the Committee,

tain the notice of the Society. They have no doubt that our own country is rich in ornamental poleon was pleased to accept, as also the memoir trees and shrubs, which if more generally known we compiled upon the subject. Our endeavors and cultivated, would be as generally admired and were rewarded far beyond our expectations: two appreciated; and they cannot but regret, that Imperial Manufactories were erected under our while so much labor and care have been bestowed direction, at the expense of the government, and upon exotics inferior in beauty, our native plants, one given to each of us, as property. have literally been left "to waste their fragrance on the desert air." Feeling confident that many if not all the indigenous shrubs abounding in our hereafter, as everything induces me to believe, vicinity, may be naturalized to an upland soil, and this fertile branch of industry shall be cultivated even improved by cultivation, they have been induced to offer premiums for such as they think entery five gallons of the juice of quinces, mixed will well repay the labor of cultivation. All which with twenty-five pounds of sugar and fermented, is respectfully submitted, by order of the Com-R. L. EMMONS, Chairman.

May 29, 1829.

From the Boston Courier.

SUGAR FROM BEETS.

It is with pleasure that we lay before our readers the annexed Memoir on the Manufacture of Sugar from Beets. It is from the pen of a Freuch gentleman, now residing in Brighton, and was powhich appeared in the Courier about a month since. M. Isnard is now chiefly engaged in chemical pursuits, and was extensively so in France beforc he took up his residence in our neighborhood. He has still some interest in the making of sugar from beets in France; a fact which we learned from several letters which he placed in our posand from the Minister of Manufactures and Com-

of the four imperial sugar manufactories, instituted by Napoleon.

The existence of sugar in the beet was discovered by Margraff, a Prussian chemist, about sixty years since. Some time after, M. Achard, another Prussian chemist, resumed the investigations of M. Margraff, and announced, that by means of a process of his own invention, there could be obtained from the bect a sugar equal to that of the cane, and at the price of only six cents a pound. A fact so important, and announced by so distinguished a chemist, induced the first class of the Institute to make an experiment of the process of M. Achard, and a committee was chosen for that purpose. According to the report of this committee, it appeared, that a great quantity of sugar could be obtained from the beet; that the process of M. Achard had not entirely succeeded; and that everything induced them to believe that M. Achard had been deceived, in saying that the sugar could be made at six cents a pound, but that it could be made for eight. Although this price was very low, this first experiment was not the cause of any immediate undertaking.

In the year ISII, while at Paris, engaged in researches in chemistry as applied to the arts, I conceived the idea of examining, more thoroughly than had ever been done before, into the question into our gardens of some of those indigenous PARATEUR of the school of medicine, who had taste to that of the colonies, but susceptible of a

serve, and which they confidently hope will ob- M. Achard. The result of our labor was a great quantity of refined sugar, which his Majesty Na-

> Such was the first and real origin of the manufacture of sugar from beets in France; and, if sufficiently to furnish the sugar necessary for the consumption of this country, it will be one of the benefits, which it owes to the genius of that great man, whose penetrating eye looked into the future, and whose liberal hand left nothing without its reward.

> The first entrance of the allied troops into France injured the sugar manufactories, and especially those called Imperial; but the impulse was given, and peace only was needed, that this kind of industry should be resumed with profit.

CULTIVATION OF THE BEET.

The beet is sown in April. It is better to sow litely sent to us in consequence of a suggestion it crosswise, (en quinconx) than at random, being on this account more easy to be weeded and rooted up by the plough. A light and even sandy soil is preferred. The beet, far from impoverishing the soil, as some seem to think, causes it to furnish crops of vegetables, in greater abundance, and of better quality. The expenses for cultivating an arpent in France (equal to one and a session from the French Minister of the Interior, quarter American acre) are as follows. Rent, 8 dollars; taxes, 1 dollar and 60 cents; 3 laborers. 7 dollars and 20 cents; seed and sowing, I dollar and 60 cents; twice weeding, 4 dollars; manure, S dollars; ploughing up, 4 dollars and 80 cents; total, 35 dollars and 20 cents.

The produce of a French arpent varies between 12,000 and 48,000. The average is considered 20,000; the average price of beets is 2 dollars per 1000 lbs. So that the cultivators received a net profit of 4 dollars and 80 cents per arpent, which is a great deal, if those lands only are sown, which would otherwise remain uncultivated,-One can already perceive how profitable the making of this sugar will become to France, in this respect alone.

Opinions are yet divided concerning the best kind of bect; the nature of the soil, and the quality of the manure, seem to have the greatest influence in advancing the sugar qualities. Manure too fresh and too abundant renders it difficult and sometimes even impossible to extract the sugar.

PRODUCE.

One thousand pounds of bects, just from the fields, lose about 15 per centum, by the cutting off of the tops, necks, and shoots, and by being washed. From 100 lbs. of beets are obtained from 55 to 60 per cent. of juice, and consequently from 45 to 40 residue. The evaporated juice furnishes from 5 to 6 of syrup, from which are made from 2 to 21 of raw sugar, and from 3 to 31 of molasses. Thus, the mean produce of a French arpent, consists in 1000 to 1200 lbs. of syrup, equal to good molasses from the colonies, if the sugar be not extracted; or 400 to 500 of raw sugar fit In the selection of objects for premiums, your inon concerning sugar from beets; and, with this for refining, and the different uses of raw sugar; Committee have had chiefly in view, the introducted design, I associated myself with M. Barruel, pre- besides 600 to 700 of coarse molasses, inferior in shrubs, whose rare beauty (in their opinion) de- been charged with repeating the experiments of fermentation like wine. Finally in 8000 to 9000 the winter for sheep and horses; and I think I continually removed. If the liquid rises much in when I planted one row of large ones whole, can assert, that in this respect, and in the making of syrups, there is no doubt that the American cultivators will find a great profit in growing the beets at large; and that the numerous distilleries it rises as far as 234 degrees Fahrenheit's therwill find in the syrups, an advantageous substitute mometer, they remove the fire, or cover it instan- large whole potatoes produced a little the most, for the West India molasses.

MAKING OF THE STRUP.

The beets are to be deprived of their tops necks, roots, and then washed; they are afterwards to be scraped. This is the only way of obtaining easily the juice. Bruising, beating, &c. have been tried, but without success. The pulp of the beet is then placed in bags of strong cloth, (but not too firm) and submitted to the action of a strong pressing. The juice, thus obtained, should, with the shortest delay possible, be poured into a kettle. It is to be most carefully observed that the juice of the beet never come in contact with wood; and if it should happen so at any time, the wood ought to be frequently washed with lime water. The juice placed in the kettle, should be raised as quickly as possible to 210 degrees of Fabrenheit's thermometer, and so kept for 15 or 20 minutes. The froth should then be removed; and if none has been formed, there should be added to the juice from 4 to 6 ounces of lime for every 1000 lbs. of juice, and the whole should be well stirred and boiled. (The lime, which is used, is obtained from lime-stone, by soaking and dissolving it in hot water.) The liquid should be kept boiling, taking care to remove the froth, and after a half or three quarters of an hour, it should be filtered through some woollen stuff. The strained liquid is again poured, quite hot, in the same kettle, or even one not quite so large, and it will evaporate in a very short time, until it has acquired a specific weight of 1,200; that is to say, until it weighs one-sixth more than water. It is to be again filtered through something woollen, and when it has cooled to 150 or 160 degrees Fuhrenheit's thermometer, it is to be replaced in a kettle, and to it there should be added from 4 to 5 lbs. of animal or vegetable carbon, reduced to a very fine powder; the whole is to be swiftly stirred; and then for every 100 lbs. of syrup, there should be added 1-2 lb. of blood, diluted with half its weight of water, the whole being well mixed together. After this the temperature of the liquid is to be gradually raised to the boiling point, but it should not boil very fast. The froth, which has formed on the surface, is to be earefully removed. It is then to be again filtered, and if the syrup alone is wanted, the liquid is to be kept together until it gains a speeific weight of 1,300. After being kept in a cool place for a few days, it will be ready for use.

FABRICATION OF SUGAR.

Those who intend to extract from the syrup, the sugar which is contained in it, should not be discouraged, if they are unsuccessful the first time. It is a nice operation, and requires experience, besides a knowledge of numerous little devices which although seeming to be of little im- hills. They may be planted any time in the portance, make a great difference, and the reason for which can be readily assigned. The follow- plant them in the fore part of May, except a few ing is the manner of proceeding and the particu- to dig early, which are commonly planted the fore lar case required: The kettle for boiling the part of April. One question is, whether it is best count of two cases of cancer upon the tongue and syrup should be very thick at the bottom: a small to cut the large ones. My own experience has lips, both produced by the use of tobacco.

the kettle a small quantity of butter is to be ad- with one potato in each hill, also one row of small ded, and it will immediately sink. Some refiners ones of equal measure, and one row of equal make use of a thermometer in the syrup, and when measure cut in the usual manner :- In autumn taneously, and taking out the syrup, put in anoth- the small ones the next, and the cut ones the least er quantity of it. That syrup which is poured of all, yet the difference was not great. Since out, should be poured into a copper kettle, and carefully covered. Three or four quantities are to be added to it, one after another as they are boiled, taking care to stir it each time, and to determine the chrystalization of the syrup, a little raw sugar is to be added. After the syrup has chits downwards, for a large potato is more than become a little cool, it is to be poured into vessels is needed for one hill. I do not generally plant of a conic form, having a hole at the smaller end. This hole is to be closed. Two or three days after, when the sugar has well formed itself, the flow off, while the sugar remains in the vessel -In order to purify the sugar still more, that which is in the cones is to be pressed, and afterwards placed over soft clay worked up with water, which, permitting a part of its water to escape, finishes the washing of the chrystals of sugar.-This is called bleaching (terrer.) Some persons bleach the sugar several times. After these bleachings, the sugar remains in the forms and the molasses is found all together in the pots, which are used to support the cones.

sugar from beets does not essentially differ from can be easily obtained; it ought to be put on to the manner of obtaining it from the cane; and it the potatoes after they are dropped in the hills at is a fact worth observing, that since the discovery of sugar in beets, many improvements have been made in the method of procuring the sugar in the has doubt about it, let him try it partially first. colonies, and even the operations for refining the sugar have been considerably improved. Making sugar has now become an art, which before was trusted to common laborers only.

From the American Sentinel.

POTATOES.

A rich loamy soil is best for potatoes, but they will grow on almost any land if it is manured, unless it be very wet, yet very dry land will not generally produce luxuriantly.

The earth should be well ploughed, and if it is subject to grubs, it is well to plough it in autumn, and the winter will destroy at least part of them.

Potatoes should be planted about even with the surface of the ground, (or a little below in dry land) and well covered when they are planted; but after the young potatoes have formed in the hills (which will be before blossoming,) they ought not to be hilled, for they being formed at a proper distance from the surface, if more earth be added. it will obstruct their growth, and others will form uearer the surface and many more small ones be produced, therefore it is best to give them their last earthing, before the tops are large, and if weeds appear, pull up those in the hills, and if necessary scrape over the ground with a hoc between the months of April, May, or June, but I generally

of the residue of the beets, which is considered the quantity of syrup, not exceeding 4 inches (ponces) satisfied me to the contrary. From my youth up, best nourishment that can be produced for the is to be poured into it. A brisk fire is to be made, I always practised planting the small ones whole fattening of cattle, and which will also serve in that the syrup may quickly boil, the froth being which time I have never practised cutting notatoes to plant, unless to try whether they will do better to lay the cut side appermost, which I have not fully ascertained, yet I believe if the largest are planted it is well to cut them and by the the largest, for small ones will produce more than large ones which are cut. I have seen potatoes produce well from the chits, which may be a good hole is to be uncovered, so as to let the molasses method, especially this year, when they are so scarce. If the land is not rich, I sometimes spread manure over the ground, and then ridge it by turning two furrows together which covers the manure, in which case they may be planted in continued rows, at one or two feet apart according to the size of the potato, and ploughed but one way, for if the ridges are crossed in ploughing, it uncovers part of the manure, yet I commonly plant across the ridges and plough both ways, because it saves labor in hoeing.

Plaster of Paris is of great use in the culture of It is evident that this manner of obtaining the potatoes, and ought not to be neglected when it the rate of about one bushel per acre, or on the tops after first hoeing, or both: but if any person

I believe orange potatoes are the best kind, for they are good to yield, and to eat; but there is a kind which are called Long Johns, that are said to produce more luxuriantly, and equally good for horses, cattle, sheep, hogs, &c.; but I have tried them but one year.

Potatoes may be kept well until new ones are large enough to dig, by drying them a few hours in the sun, and rubbing off the chits, and putting them in a place, not very dry or very damp. The digging them is in dry weather in autumn, when the leaves and stalks begin to decay. If they are planted in hills it is a good method to dig them with a dung-fork with four or five tines, or with a fork standing like a hoe, that they be not injured by digging; but if they are planted in continued rows, they may be turned out of the ground with a plough and finished with a hoe.

A FARMER.

Tin in Massachusetts .- The last number of Silliman's Journal of Arts and Sciences, contains a letter from Amherst, to the Editor, accompanied with a specimen of genuine New England Tin .-It is well characterized, and said to be the first that has been discovered in the United States .-It occurs in Goshen, Hampshire county, Mass .-The writer of the letter gives the result of various experiments to test its qualities, and pronounces it to be undoubtedly genuine tin .- Courier.

The last Medical Intelligencer contains an ac-

[Extracts from an Address delivered before the Berkshire Association for the Promotion of Agriculture and Manufactures, at Pittsfield, October 2, 1828. By George N. Briggs, Esq., Vice President of the Society.]

(Concluded from page 356.)

Habits of industry, of frugality, of temperance, and economy, tend as effectually to improve the moral and intellectual condition of men, as they do to improve the condition of their farms and in-'crease their wealth. Morality and illeness cannot dwell together; industry and vice hold no communion with each other.

That branch of domestic industry which relates to household manufactures, and which depends upon the habits, education, and labor of females, is not less important to the general prosperity of community, than the more masculine labors of the agriculturist. The exhibitions at our Fairs for many successive years, of articles of this description, have been highly complimentary to the ingenuity and industry of the ladies of Berkshire.

A perfect acquaintance with every part of domestic or household economy, is not only compatible with the most finished female education, and the highest state of refinement of mind and of manners, but is absolutely necessary to the proper discharge of those duties in life to which the sex is destined. The appropriation of suitable portions of time, during a course of education, to industry and useful labor, gives energy and vigor to the mind, and stimulates to health and soundnsss that delicate and flexible female constitution, which if wasted in idleness, the one would be enfeebled and the other ruined. Genius and the graces wither beneath the sickly influence of disease. But beauty mingles her richest tints, and breathes her sweetest fragrance into the rose of health.

It should always be borne in mind by the daughters of our country, and by those who are charged with the responsibilities of their education, that that female only has reached the greatest excellence of character, who by the course of early instruction, the formation of her mind, her elegant accomplishments, and practical acquaintance with the household duties, is prepared to meet the vicissitudes of ever-varying fortune : who in the sunshine of her favor, would ornament and adorn a palace; or serenely bending beneath her frowns, would make the lowly cottage a home of contentment, and light up the smile of joy amidst the ruin of worldly hopes. To such a one, approving wisdom says, " Many daughters have done virtuously, but thou excellest them all."

Amidst the general prosperity which pervades our country, there walks abroad an evil distinguished by its ravages, and rendered conspicuous by the misery and desolation which it spreads throughout every portion of our population. The demon of intemperance reigns over his besotted subjects with a despotism as absolute, as cruel, and as unrelenting, as that which prevails over the regions of Pandemonium. The ensigns of his power, and the trophies of his victories, over poor, wretched, and degraded man, are waved in gloomy triumph over every city, and town, and village, and hamlet, in our widely extended continent.

Though much has been done within the last

will take an individual and personal interest in the the elevated station of a rational and intelligent subject, and by precept and example enforce the being, beneath the level of a brute, and driven from necessity of an entire disuse of every kind of ardent spirits. Let the farmer banish it from his field, and the mechanic from his shop, and both refuse to receive into their employ men who will not labor without it. Let the merchant cease to be the medium of circulating through the community the instrument of so vast an amount of crime and of misery. Let the lawyer, the physician, and the clergyman, drive it from their sideboards; and let no individual in society, on any occasion, from fore the judgment seat, motives of friendship or politeness, place before his companion or his guest, the poisonous and exhilarating draught. When these things shall be done, its pestilential hand may be stayed.

Who can cast his eyes around him and not be appalled at the scenes which rise to his view?-Imagination is too sluggish, and language too impotent, to draw the picture of moral waste, of mental ruin, and of personal suffering, with which that bears the relation of father, of son, of brother, this horrid demon has filled our native land. And in withdrawing the mind from the contemplation of the universal havor, which like the Siroc blast mon all his powers and put forth all his efforts to has spread over the moral aspect of the country, arrest and control a torrent which carries with it it gains no relief by fixing itself upon the individ- such mighty ruin? nal victims of its reckless influences.

See the young and interesting object of parental solicitude go forth into the world, possessed of all the advantages which wealth, and genius, and fill stream, whose turbid and resistless current is learning can bestow. His morals are unstained sweeping them down into that deep alsyss, whose by corrupting vice, and he has a character as pure and as lovely as virtue and innocence can form .-Uniting his destiny with a soul of kindred character, he takes his place in society. The hope of his friends and the promise of his country, he is allied to the world by all the strong and endearing ties of affection, honor, and of social intercourse. But when he has just commenced his career of prosperity and of usefulness, the habit of intemperance insiduously steals upon him, until, subjected to the spell of the accursed sorceress, he surrenders all his moral, physical, and intellectual powers to the insatiate control of a morbid appetite. A sad reverse is now fixed upon all his prospects. A strange and unaccountable change has come over the whole man. That laudable ambition to rival the great and the good which once glowed in his manly heart, is succeeded by a perfeet insensibility to all those motives which stimulate to noble action. The partner of his heart droops and sinks beneath the unfeeling cruelties of him who once would not have "let the winds of heaven visit her face too roughly." The sacred pledges of early and chastened love, who once were the delight of his eyes and the hopes of his heart, are now repulsed from him with cold indifference, and compelled to be the living witnesses of a mother's grief, and a father's shame.

Reformation is now hopeless. That pride of character, which long maintained a colorable ascendency over his more public conduct, is at length consumed by his burning appetite. The entreaties and remonstrances of friends, the cries of children, and the silent agonies of his sorrow-stricken wife, are lost and dissipated amidst the noise of his Bacchanalian orgies.

Conscience, after having a thousand times shaken her terrific sceptre over his guilty head, five years to check the evils of intemperance, and has uttered her last friendly admonition, and left ject, that could be obtained in Cincinnati, respectto repair its ravages, experience has shown that him to his fate. He persists in his course, in open fully submit the following brief Report, upon this

the sober, moral, and reflecting part of community the violated canons of the living God. Sunk from the society of men, he is found a drunken animal. reeling about the streets, pouring blasphemies from his polluted lips, and contaminating the very atmosphere in which he moves. To render more awful his catastrophe, from the scenes of his revelries, with horrid imprecations on his tongue, he staggers into the immediate presence of his MAKER, and having passed that undefinable line which separates time from eternity, he stands be-

" Even in the blossom of his sin. Unhousell'd unanointed, unanneal'd: No reck'ning made, but brought to his account, With all his imperfections on his head."

This is the end of the drunkard. Who, in view of this sad reality, dare fold his arms and say, I am safe, when he stands in the midst of the very causes which produced the catastrophe? Who of friend, or of citizen, does not feel himself impelled by all the sacred obligations of life, to sum-

We are surrounded with multitudes of our fellow beings who are beyond the reach of human exertion, and have already plunged into that frightvawning chasm receives the annual tribute of fortu thousand victims from the population of this enlightened country. But if old and inveterate habits cannot be overcome; if the victims of self-immolation refuse to be restored; by a timely and friendly interference, the young and rising generation may be saved from the contagion of vicious examples, and rescued from the vortex which has swallowed up their fathers.

Let us then individually and collectively resolve to exert our influence and interpose our example to produce a result, fraught with such momentous consequences to thousands of our species, so conducive to human happiness, and so honorable to our country.

From the N. H. Patriot.

MR EDITOR-The following communication, although intended for the information of the planters of Hamilton county, in the State of Ohio, may not be uninteresting to many of your readers; since it has been found from actual experiments that the white mulberry will flourish as well upon the hills of New Hampshire, as in the rich and fertile valleys of the Miami. It is to be hoped that the time is not far distant when this new source of domestic industry will become an object of attention and profit to our New Hampshire farmers.

Yours, &c., RUSTICUS.

CULTURE OF SILK.

The Committee appointed by the Hamilton County Agricultural Society, at their quarterly meeting in March, for the purpose of preparing some instructions in regard to the rearing of the white mulberry tree, and the silk worm, having consulted the most approved works on the subno successful stand can be taken against it, until defiance of the laws of man, and in full view of important department of the American System:

That the seil and climate of the United States are well adapted to the growth of the white mulberry tree, (murus alba,) and the silk worm, has been satisfactorily proved by the various experiments, which, within the last fifty years, have been made upon that subject, in different parts of the Union. That the culture of silk in this country will be found highly profitable to those engaged in it, is equally certain. Facts might easily be multiplied on this subject, but the following are deemed sufficient.

Four acres of ground planted in mulberry trees, near Boston, have afforded enough food in one season, for the support of as many silk werms as produced four hundred and twenty pounds of silk, worth three dollars and fifty cents per poundamounting to fourteen hundred and seventy dollars. All the labor necessary in producing this result, was performed by four girls, whose attention was required but for a small portion of the vear.

Before the culture of silk was introduced into the less fertile parts of Languedoc in France, the peasantry were miserably poor,-they are now among the richest of the kingdom. In some parts of France a single mulberry tree has been known to yield a guinea annually to the owner, from the sale of its leaves. When it is recollected that the cultivation of the mulberry tree is neither difficult nor laborious, and that the collection of the leaves, the feeding of the worm, and the reeling of the cocoons, can all be advantageously performed by women, children, and decrepid persons, it will certainly require no arguments to induce the farmers of the Miani county to turn their attention to the culture of silk. The results of this business are much more immediate than is generally supposed. By procuring during the present season a supply of the eggs, and feeding the worms upon the leaves of the common black mulberry of our woods, which are found to be a pretty good substitute for the white, a return in profits may be had next year. If the seed of the white mulberry be sowed this season, the young trees will next year afford leaves for the worms.

There are three modes pursued in the cultivation of the white mulberry tree: The first is to sow the seed broad cast, and when wanted for food, to mow down the young trees annually, commencing on the second year. The second is to transplant them from the nursery, and suffer them to attain to the size of trees. The third, and perhaps more preferable mode, is to sow the seed in drills, and allow the shrubs to attain to the beight only of three or four feet, which may be done by cutting of the top limbs, the tender parts of which will answer as food for the worms. Mere mulberry foliage may be produced in this way, from the same quantity of ground, that can be obtained if it were occupied by full grown trees. The labor of gathering the leaves is also much less than is required after the trees have attained their full

From the experiments made in France, it has been ascertained that ground which has a sandy or gravelly soil, is best adapted to the growth of that kind of mulherry leaves, which affords the finest quality of silk. The leaves of those mulberry trees which grow in a very rich soil, are found to be too luxuriant and too full of juice, for the production of the hetter kind of cocoons,

ferent periods, say the last of April, the middle of may be laid on the stages, or tables, and no smoko May, and the first of June. When the ground or efflorium of any description permitted to enter is properly dressed, and drills prepared, the seed the apartment, as the worms are very sensiis to be sown after the manner of sowing lettuce live. seeds, and should be covered with fine light

Those of the young shrubs which it is wished should attain the size of trees, must be transplanted from the drills the second year, and the most suitable time for this removal is immediately after the fall of the leaf in autumn. The side buds should be stripped off, leaving only such as are necessary in the formation of a suitable head for the tree. At the time of removal of the young trees, they should be cut off within seven or eight inches of the ground, and if they do not shoot well, the first year after they are transplanted, they should be cut in a similar manner, the following season. The ground around the roots of both those in the drills and those transplanted, should be dressed several times a year, which will greatly assist their growth. It is advisable to plant out a few of the trees in sunny situations, that a supply of the leaves may be had for the worms of such eggs as may happen to hatch before the usual season

The heads of such as are intended to attain the size of trees, should be hollowed out in a manner that will render it easy to collect the leaves, and such branches as may be broken in that process should be carefully removed. It may be proper to remark, that in France the cultivation of the mulberry tree for the sale of the leaves, is a separate business from the rearing of the worms; and it is particularly recommended to the farmers of the Miami county, to lose no time in filling some portion of their farms with this valuable tree, inasmuch as the day is not distant when the demand for its foliage will give them annually a handsome profit. It has been ascertained that the second crop of leaves, which comes out after the first, have been stripped off for the worms, furnishes a nutritious food for sheep, and is eaten by them with greediness. When intended for this object, the leaves should be stripped off a little before the time that they would naturally fall, and laid by for use in the winter season. This experiment is worthy of a trial by our farmers, inasmuch as, after the first year, the mulberry tree requires little or no attention; thus annually yielding a supply of food, without any cost save that of gather-

SILK.

The raising of silk properly commences with the batching of the worms. This will take place generally when the mulberry foliage is sufficiently matured for their consumption; or, when the spring is advanced enough to make the temperature from 70 to 80 deg. of Fahrenheit. The first preparation to be made for them is that of a dry, airy room, or small building, in which stages of a convenient height and breadth for feeding them should be erected. Care should be used to exclude the enemies of the worms, viz. cats, poultry, rats, mice, and ants, from the room and stages in which the worms are placed. The former may be excluded by ordinary precautions, and the ants, by keeping hot lime around the posts of thu stages. The eggs must not be brought out for hatching till the weather is settled; and if, afterwards, there

June. The safer plan is to sow the seeds at dif- its proper height. The eggs, when brought out,

When the worms first appear they will be black; those which are red are bad, and should be thrown away, for they will produce no co-

In four days, most of the worms will be batched, and those which come out after that time are generally too weak to produce silk. The productions of each day should, when large quantities are raised, be kept separate, in order that they may form cocoons at the same time. When they are first hatched, they must be fed with fresh and tender leaves of the mulberry; not more than half a dozen leaves to 1000 worms will then be required : but, afterwards they will each devour a leaf. When the leaves become dry, or are eaten up, fresh ones must be given them, taking care not to put on so many as to smother the worms. or obstruct their motions. For the first twenty days, they must be fed three times a day, and after that, as often day and night as their food is destroyed or wilted.

The worms must be kept free from dampness, whether in their food or rooms; and they must not be too much crowded; a thousand full grown ones will be sufficient for a table three feet by

About the 6th, 10th, 16th, and 22d days, the worms will shed their skins and become sickly .-At these periods, they abstain from food, and should be fed scantily at first, and then not at all, till they recover. Semetimes they become afflicted with incurable diseases, in these cases they will he known by voiding a yellow liquor, and must be immediately separated, and as well as the dead ones, thrown away. The disease is infectious, and therefore particular care should be taken in preventing its progress.

Throughout the whole period of feeding them. their litter should be carefully taken away; at first, this need not be done often; but, during the last stage of their growth, it must be done as frequently as possible. Indeed, the utmost care should always be taken to keep them clean, and give them fresh food, and pure air.

When the worms are ready to spin, they will cease to wander about, become of the color of a new egg, nearly transparent, and will search for things upon which to fasten their cocoons .- When a considerable number have this appearance, branches, twigs, and leaves, must be put up round the stages or tables, upon which they will mount and spin their balls. This generally happens from the 30th to 36th days. Various substances are used for the worms to spin upon, but Mr G. B Smith (from whose circular we have taken much valuable information) considers chesnut leaves the best. These, when dry, curl up, and thus form a place of deposit for the silk ball. Twigs must be broken off, with the leaves on them, and placed around the stage.

The worms, after beginning to spin, require no further attention till the cocoons are completed .-The worms that begin to spin each day should be kept separate, and in eight days from the commencement of spinning the cocoons, they should be removed. Those from which eggs are expect-The mulberry seeds may be sown at any time should be a change to cold, a little fire may be ed, must be placed in a dry room, upon white from the last week of Ap il until the first week of kept in the room to preserve the temperature at paper, in rows about a foot apart. The worm will and then come out a gray miller. In a short time ciples of sound morality and religion. 2. To prethe females will commence laying upon the paper, pare those designed for professional life to enter each one laying about 450 eggs, which are at first any of our colleges, or if preferred, to fit them to prised at this result. I cut Lucerne for soiling of a sulphur color, but soon turn to a dark lilac; those which remain of the vellow hue are uscless, and may be thrown away. The good ones must pursuits, or any of the useful arts, to enter upon inches high. I have it growing from seed sent to be kept in a dry, cool place, in a temperature of their occupations well furnished with useful me by the Society of the Georgio-fill at Florence, 40 or 50 degrees. In a high temperature, they knowledge, and acquainted with their business as might hatch.

The cocoons, from which silk is to be obtained must be stripped of the floss, or loose outer coating, and the insect destroyed; otherwise, it would studies, which arrangement we have found from anists. soon pierce the ball and destroy the silk. The insect may be killed either by baking the balls for half an hour in a half heated oven, or, which is youth who commence their course in early life.the better mode, by steaming them for a few minutes in a common kitchen steamer. After the cobe barely kept in without scalding, at which temperature it must be constantly kept. Twigs are then to be stirred about in the vessel till a sufficient number of fibres is caught to make the thread you wish, and as the fibres break they are to be renewed, so as to keep the thread even. In knowledge of the science of Horticulture, under in good land, in the same season, in which it is this manner the silk may be reeled off with a common reel, and afterwards twisted in the manner required by a common spinning wheel. After its of industry and economy will be formed in this it should be hoiled four or five hours in soap and water, and ripsed with clear water, to disencumber it of the gum, which naturally adheres to it. The silk is now ready for use, and may be dyed any color to suit the consumer.

In this report the Committee have not aimed to make an elaborate, or novel treatise on the cultivation of the mulberry, or, the rearing of the silk worm; but merely to exhibit, in plain language, A strict and sacred observance of the Sabbath will the more general and important directions in relation to those subjects, for the aid of the farmer, and beginner, who may desire to embark, on a limited scale, in this, to our country, new and The French language will be taught without any profitable branch of business. Other more minute rules will be easily learned by experience; and others, of a nice and more abstruse character, may be gathered from books, written upon the subject in other countries.

B. DRAKE. F. D. MANSFIELD. Committee. CHARLES FOX.

White mulberry seed, and some eggs from a stock of the Italian silk worm, belonging to the Hamilton County Agricultural Society, may be had upon application at the office of B. Drake, on Fourth, near Main street, Cincinnati.

Cincinnati, April 1st, 1828.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JUNE 5, 1829.

WOODERIDGE SCIENTIFIC AND PRAC-TICAL SCHOOL.

Messrs J. Ely, and D. R. Austin, propose to open a school at South Hadley, Mass. This is intended as well for physical as intellectual education, and to convert "the ordinary exercises of a Gymnasium into some useful and lucrative channel." The "Course of Instruction," as stated in a Prospectus, with the signatures of the above mentioned gentlemen, will embrace the following ob-

commence their professional studies. 3. To prepare those designed for mercantile, or agricultural proportion of time will be devoted to chemistry and the natural sciences in connexion with other experience in a great measure obviates that aversion to books which sometimes is manifested by The government of the institution will be mild and parental. The instructors will reside in the construction of plain and useful materials in a workshop, provided for the purpose. An eligible site for an extensive garden has been selected, where those pupils who may desire it will have an approved and skilful gardener. The advantages of this system will be obvious to all. Habcarly life, and the intellectual powers gradually invigorated and prepared for more intense and continued application. Suitable encouragement will be given to any who may wish to contribute to their support by labor. The annual charges for each scholar will be \$150 including tuition, board, room, lights, fuel, and washing. Bedding, stationary, books, &c. will be furnished if desired, be required. The interval of public worship will be devoted to the study of the scriptures, and the evening to biblical instruction and sacred music. additional expense," &c. &c.

The plan of the seminary and the qualifications of its instructors have been recommended to public patronage by the following gentlemen, viz. ANDREW GATES, D. D., Principal of the Polytechny, in Chittenango : Eliphalet Nott, D. D. LL. D., President Union College; R. PROUDFIT. D. D., Professor of Languages; F. WAYLAND, Jr, D. D. President of Brown University; Rev. Ly-MAN BEECHER, and Hon. SAMUEL HUBBARD, Boston. Respectable and numerous references are given, and the auspices of the proposed institution for Dutch clover, and it ought to take its place. are as favorable as could be wished by any person who may have an interest in the correct and efficient education of those who are preparing to "act well their part" in the grand drama of life.

FOR THE NEW ENGLAND FARMER.

LUCERNE.

MR EDITOR-Being fully convinced, that the Lucerne* grass will be a most important and valuable substitute for clever, I think it a duty, to add the further experience, which I have had in relation to it. I have now four distinct species of it. One is now in its eighth summer. Two in their third, and one in its second. While orchard grass and clover perished in our late trying win-

* I always use the French orthography for this grass, because I know no sufficient reason for changing it to Lucern.

remain in its chrysalis state ten or twelve days, jects. "1. To inculcate upon the pupils the prin- ter in considerable quantities, the Lucerne is more vigorous than ever. Those who know the great depth, to which this root extends, will not be sur-(even this late season) on the tenth of May, and the new shoots after cutting, are at this time eight (a name which signifies friends of agriculture)far as possible by practical experience. A due from seed brought home from Chili, by Commodore Hull, and from American seed. They are all the same plant, the Medicago sativa of the bot-

> The grounds of preference of the Lucerne to the clover, are the following:

1. The clover is a biennial plant, and like all biennial plants it furnishes a poor, or no crop the first year, and dies at the end of the second. If coops are thus prepared, from thirty to fifty of same family with the students, and associate with uninformed minds should oppose this last asserthem, in proportion to the size of the thread in- them both in their exercises and studies. From tion, because they find clover always in their tended to be spun, may be placed in a kettle of one to two hours a day will be devoted by those grounds, I reply, that this is, because its seeds are water heated to such a degree that the hand may of sufficient age to practical agriculture, or to the abundant in our soil, and manure, and there is a constant succession of plants-but let any one sow clover only, and in the third summer his field will present a most desolate appearance.

2. The next superiority of Lucerne over clover an opportunity of acquiring a thorough practical is, that it will give three crops, often four, at least, sown, provided it be sown in April. In this respect, I am able to assert from experience, that it is better adapted to our climate, than even to that of France, for reasons, which I think, in addition to the FACT, would be satisfactory.

> 3. The Lucerne is not so coarse a grass, as the clover-its stalks never become so woody, and vet they are stiffer, and less liable to lodge.

> As to curing it for hay, it is about as troublesome as clover, but if got in half cured, and, salted, it makes a better hav. Now, let me not be misunderstood on this subject. There is nothing, which is so injurious to the prevalence of sound opinions on all subjects, as exaggeration. It has done more mischief in all arts, and sciences, than any other cause.

> Lucerne is only to be compared with clover. It is no sort of substitute for the culmiferous grasses. It cannot be put, for a moment, in competition. with herds grass, as we call it, or timothy, as the southern people term it-or for orchard grass, or for pratensis, or red top, or the meadew foxtail, or the excellent grass recommended by Mr Phinney, the tall meadew out grass. These grasses are, and must be, forever, our chief dependence for excellent hay.

> I recommend the Lucerne solely as a substitute and, within twenty years, it will take its place. everywhere, in America. I say it, without fear of ridicule.

> The Lucerne is the favorite grass of France. south of the river Loire, of Spain, Portugal, and Italy-of Rio Janeiro-of Buenes Ayres, and Chili. Why does it suit these climates? Because its long tap root enables it to sustain the long droughts and excessive heats of these climates .-But we, in Massachusetts, are subject, in an enginent degree, to these same evils. When our crops fail, it is chiefly owing to these causes. The Lucerne is calculated for early, and late pasturage-for small farmers, yielding at least double the quantity of food, which any other plant can do. I may be called a speculative farmer, and I am so, if 25 years close attention entitles me to the name. But practical farmers will find, that so

far as it respects this production, my experiments and to see with their own eyes, the result of my have not been without their practical use.

GRAFTING MATERIALS.

Not discouraged, by all, which has been written on this topic with us, I am induced to give the latest improvement in England on this subject .-As an experiment, derived and recommended from such a source, it would have its value, but it, at once, recommended itself to my notice, for its simplicity, neatness, and reasonableness. I shall subjoin my account of its success with me.

The new method is thus described in a letter from David Powel, Esq. inserted in the London Horticultural Transactions, vol. v. I shall only introduce the essential directions.

"Grafting wax properly prepared, when in a melted state, is spread evenly on sheets of moderately thin brown paper, which when cold is cut into strips about three-quarters of an inch wide. When one of these strips is to be used, warm it with the breath, and bind it round the stock and scion, pressing it gently with the hand, when it will be found to adhere so closely as totally to exclude both air and moisture. No further care is necessary, though it may be as well to look over the grafts occasionally, pressing the paper close with the hand where it may have before been occasionally missed." This plan of applying wax cements instead of clay, struck me at once, as not only exceedingly simple, but admirable for its peatness.

I accordingly treated 100 grafts in this mode. I procured some coarse, but strong and flexible brown paper, made of tarred cordage, and having prepared the grafting wax, by the recipe subjoined, I spread it with great facility, by a common table knife, over the paper evenly. It cools instantly. I then cut it into strips of about an inch wide. In a warm sun, it requires no heatingbut in a cool day, the breath will warm it sufficiently. As soon as the graft is inserted and tied with matting, or twine, the strip is wound round from the bottom of the cleft, to the insertion, and sawed end, and doubled over that. The operation requires five seconds only, and the air is most effectually excluded.

I put in grafts with clay, and with this new method, and the success of the last was much greater than with the clay. Six weeks have now elapsed, and the covering is perfect. Neither rains, nor sun affect it. There is one other great benefit. The paper is made stronger by the grafting wax, and may be unwound, and taken off without injuring the bark. I have applied it to green-house plants-to the Camellia. Here permit me to add, for the benefit of florists, that the Camellia, heretofore grafted only by approach, is found to succeed equally well, if grafted in the manner of approach grafting, the scion cut off, and the end left long enough below, to insert it, into the neck of a phial of water, or into a turnip, or potato. The grafting composition recommended in England, and which I used, was I lb. of pitch -1 lb. of resin-1-2 lb. of bees wax-1-4 lb. of hog's lard-1-4 lb. of turpentine. I hold, however, very cheap, all these specific nostrums; great variations may be made in them, taking care to see, that the compound is neither too stiff to use, nor too soft to melt, under the solar heat. I have been very tedious, but could not well abbreviate J. LOWELL. my remarks.

Roxbury, June 1, 1829.

N. B. I invite gentlemen to visit my grounds.

experiments on both subjects.

The last number of Silliman's Journal contains a letter from Professor Griscom, in which an interesting fact is disclosed, in relation to the Saratoga water. From actual experiment, it appears that the water of the Congress Spring contains a portion of Iodine, the presence of which, the Professor rationally concludes, adds to the efficacy of the fluid, especially in scrofulous affections.

Canal Tolls .- On Saturday the 9th altimo, there was received for tolls, by John B. States, collector at Albany, three thousand five hundred and seven dollars, which is one thousand dollars more than was ever collected before in one day at the same office .- N. Y. Gaz.

A stated meeting of the Massachusetts Horticultural Society, will be held, by adjournment, at the Society's Room, over the office of the New England Farmer, on Tuesday, June 9, at 11 R. L. EMMONS, Rec. Sec'y.

Seed Potatoes.

MISCELLANIES.

Hints to People of Moderate Fortune .- The prevailing evil of the present day is extravagance .-I know very well that the old are too prone to preach about modern degeneracy, whether they sage advice of our fathers, it is too plain that our present expensive habits are productive of much domestic unhappiness, and injurious to public prosperity. Our wealthy people copy all the foolish and extravagant eaprices of European fashion, without considering that we have not their laws of inheritance among us,-and that our frequent changes of policy render property far more precarious here than in the old world. However, it is not to the rich I would speak. They have an undoubted right to spend their thousands as they please; and if they spend them ridiculously it is consoling to reflect that they must, in some way or other, benefit the poorer classes. People of moderate fortunes have likewise an unquestioned right to dispose of their hundreds as they please; but I would ask is it wise to risk your happiness in a foolish attempt to keep up with the opulent ?-Of what use is the effort which takes so much of your time, and all of your income? Nay, if any unexpected change in affairs should deprive you of a few yearly hundreds, you will find your expenses have exceeded your income-thus the foundation of an accumulating debt will be laid, and your family will have formed habits but poorly calculated to save you from the threatened rum. Not one valuable friend will be gained by living beyond your means, and old age will be left to comparative, if not to utter poverty.

There is nothing in which the extravagance of the present day strikes me so foreibly as the manner in which our young people of moderate for-

tune furnish their houses.

A few weeks since, I ealled upon a farmer's daughter who had lately married a young physician of moderate talents, and destitute of fortune. Her father had given her at her marriage, all he ever expected to give her; viz. two thousand dollars. Yet the lower part of her house was furnished with as much splendor as we usually find among the wealthiest. The whole two thousand had been expended upon Brussels Carpets, Albaster Vases, Mahogany Chairs, and Marble Tables. I afterwards learned that the more useful household utensils had been forgotten; and that a few weeks after her wedding, she was actually obliged to apply to her husband for money to purchase baskets, iron spoons, clothes lines, &c .- and her husband, made irritable by the want of money pettishly demanded why she had bought so many things they did not want. Did the Doctor gain any patients, or she a single friend, by offering their visitors water in richly cut glass tumblers, or serving them with costly damask napkins, instead of plain soft towels? No,-Their foolish vanity made them less happy, and no more respectable.

Had the young lady been content with Kidderminster, carpets, and tasteful vases of her own making, she might have put one thousand dollars at interest; and had she obtained six per cent., it would have clothed her as well as the wife of any man, who depends merely upon his own industry, ought to be clothed. This would have saved much domestic disquiet; for, after all, human nature, and a wife is never better beloved, because she teazes for money.

| Wars.—I have been as enthusiastic and joyful as any other one, after a victory; but I also confess that even then, the sight of a field of battle has not only struck me with horror, but even turned me sick; and now that I am advanced in the property of the property would have clothed her as well as the wife of any

How to Bathe.-Reader, we are disposed to take life, I cannot understand any more than I could as some eare of your body as well as your mind.-Be duly thankful, therefore, for the advice we are about to give you. If you are an M. D. do not turn up your medical nose at our instructions, for they are founded on much experiment and long as possible—but, on the contrary, in endeavoring have cause or not; but laugh as we may at the experience, backed by the uncommon wisdom we to destroy each other, as if Time did not himself received from nature.

The spring hath come, "refreshing earth, reviving all but man," your head aches, and you feel oceasionally drowsy, languid, and uncomfortable. Take a warm bath; it will relieve you in an hour; savage state, disguised or ornamented by ingenious but take it in the proper way,

"When 't is done 't were well It were not done quickly :

for in this lies the mischief of warm bathing. A man generally posts into a bath as if he were carrying an express, or running away from a broomstick .-- He is out of breath, and in a perspiration on his arrival. He undresses himself in a great hurry, souses himself in the hot water, kieks about for five minutes, emerges with every pore open, puts on his garments, looks complacently in the mirror, and thinks he has taken a warm bath .-No such thing: he has taken nothing but a cold! In one hour he begins to sneeze, and the next day he commences coughing, and curses the bath,-Philosophy grieves over his folly, but will not relieve his nose and lungs. Why did the bath give him a cold? Because he was in a perspiration when he went into the water, which said perspiration was increased by the heat, and checked as soon as he raised, " placedum caput [it should be corpus] unda," into the colder medium of the air. The order of nature must be reversed to prevent a man from taking cold under such circum-

Now reader, we will tell you how to take a bath. In the first place, pay your note if it be due; or if you cannot do that, let it be protested, and think no more about it. If you have any quarrel on hand, whip or get whipped at once, tranquillity of mind is all important in rendering the warm bath beneficial. Walk leisurely to the house of ablution, and disrobe yourself with moderate haste .-You may have the water hot enough to parboil you if you choose, that is left to your own taste. In with you; and to beguile the time, read a newspaper, or smoke a cigar, taking care, however, to keep the cigar above water; if you don't it will go out. In about half an hour the water will cool to nearly the temperature of the air, and you will have gone gradually and safely through half a dozen climates. You will have left the torrid for the temperate zone .- Then let in the cold water, very slowly, almost drop by drop, and in the course of twenty minutes you will find yourself in a cold bath. Your pores will have closed gradually and moderately, your sensations will be exquisite during the process, and you will feel strength and elasticity in every limb. You emerge from the cold water into the warmer air, dry your body thoroughly with a coarse towel, and feel like a new man. It is an impossibility for you to take cold: if you do, you are at liberty to come and box our ears for giving you had advice .- N. Y. Courier.

15 years of age, how beings, who call themselves reasonable, and who have so much foresight, can employ this short existence, not in loving, and aiding each other, and passing through it as gently do this with sufficient rapidity! What I thoughs at 15 years of age, I still think: "war, with the pain of death which society draws upon itself, are but organized barbarisms, an inheritance of the institutions and false eloquence."- Louis Buonaparte.

FOR THE NEW ENGLAND FARMER.

CIRCULATION OF SAP IN TREES, &c.

so, which are the best conductors?

Many of these questions have not, I believe, been answered to the satisfaction of physiologists have been the subject of speculation and experiment for more than a hundred years. Nor have they been entirely able to satisfy themselves on many of the points, or phenomena, that are involved in the economy of vegetable nature, although they have all adopted certain theories which seem to enlighten, but not to satisfy the minds of investigators. It cannot be expected, therefore, that I can throw any new light on the subject : but I may bring together some of the old

The first questions are, what causes the circulation of sap? And how is it affected by heat?

To enter into all, or even many of the theories which exist on these points, is not in my power, even if I had the inclination, for it would involve more time than I have to spare, and more research than my habits will permit. I must, therefore, confine myself to some general views, which, alothers to investigate the subject. To this end it circulation? may be necessary in the ontset to look into the construction, or organic conformation of plants; the perspiration of plants, and the circulation of the upper portion of the tree; but in all the nature and properties of their juices and other the sap, there can be but little doubt, from the va- cases when there was sufficient heat to affect the substances contained in their cellular tissue, and rious experiments that have been made. Is there a difference between the power of plant; and many changes, effected by electroconducting heat possessed by different trees? If chemical agency, occur in the juices which fill its cells." If this opinion be correct, the third question of Mr Coffin seems to be answered.

From experiments that have been made, it apup to the present day, although some of them pears that if a twig be cut, with the leaves expanded, by putting the cut end into a watery solution of Brazil wood, the coloring matter will ascend into the leaves, and to the top of the shoot, leaves are developed? through real organic tubes; these are the sap, or conducting vessels of the plant. This is said to leaves are out, the flow of sap comes as much, at be owing to the perspiration, or transpiration least, if not more, from the upper part of the which is still going on while the leaves are fresh wound or cut in a tree, than it does from the lowon a newly cut shoot. But if the twig be deprived or part: and from the experiments made by him, of its leaves, the water will not ascend far. At a and others, it seems to be proved. He took a later period of the season, if we make a transverse young tree, which he sawed off about 18 inches bark near the wood is filled with fluid. This is suspended in the same position in which it grew. contained in vessels of a different description from This was done very early in the season, (I think those in which the sap rises; the first being February) before there was any appearance of placed in the wood, while these are placed in the vegetation. For several days successively he exbark only in trees, and are called proper vessels, amined both the stump and the suspended top of or returning vessels, from their function of carry- the tree. When the weather was cold, the cuts ing downwards the sap after its elaboration in the of both remained dry, as they did during the leaf. Is it, then, that the perspiration of plants is nights-but when warm, sunny days succeeded though they can afford no proof, they may induce one of the means by which the sap is brought into frosty or cold nights, both the stumps and the top

to refer to some of the experiments and observa- while he stripped them from the others. All these ent ends put into vessels which contained a cer-We are told that all plants are composed of tain weight or quantity of water. The branches at evening than they did in the morning. This Dr Hales thinks an incontestible proof of the certain connexion between the perspiration and elevation of the sap.

But when we recollect that early in the spring, before the leaves are put out at all, the sap flows more abundantly than at any other time, (as in the maple, and grape vine) and particularly so after cold nights are succeeded by warm days, it seems that other causes must be looked for to solve this great phenomenon. It is known that in proportion as the leaves expand and increase on these and other plants, the wound made by tapping, or cutting off a branch, ceases to bleed, as it is termed ;-and that when the tree is in full leaf, it will not bleed at all. The cause, therefore, of the flow of the sap is not transpiration, although its circulations are mainly dependant on the leaves. summer, be deprived of a pertion of its leaves, it will diminish its vigor; and if we strip it altogether it will cease to grow. We also know that those branches that are most abundantly furnished with leaves grow the best-it would seem therefore that the leaves are organs of suction, or pumps, to elevate or keep the sap in circulation during the summer, or temperate season of the year. How then are we to account for this prodigious flow of the sap in the spring, before the

Mr Duhamel says that in the spring, before the cut of a branch, the wood appears dry, while the above the ground. The upper part of this tree he became moist at the wound, and the juices in That there is considerable connexion between some instances were active enough to fall from stated, when the tree is in leaf, the sap will appear, after it has been elaborated, in the inner part of the bark. It is for this reason that in tapping maple trees they always cut into the wood, not flow.

From this, and other experiments that have been made, it appears that the sap is retained in the cellular tissue, or the vascular organs, during the winter, in a soluble state, and as soon as the heat of the sun is sufficiently great to liquify it, it flows from all parts of the tree where these vessels exist, and more or less abundantly, according to the nature of the plant: these vessels being larger and more abundant in some trees than in others, and probably better filled with sap in some than in others. This may be the cause why maple trees furnish sap so abundantly when cold frosty nights are succeeded by warm sunny days, this tree, when it will not from the north side.

however, is but conjecture; for I have never will then show life, while the centre will show found any satisfactory reason offered which will no marks of vegetation. explain this phenomenon, as it is most certainly, if it be true, that frosty nights are necessary to the sap in motion; but how does it affect it? is the flow of the sap, as above stated. In tropical question of Mr Coffin. climates, where there is no frost, trees are tapped, flowing in the day time.

quently burst out, and make a new growth. This the utmost extent of its branches. is called the growth of the second crop. If the san does not cease, altogether, to circulate, it cerbe easily separated. And after midsummer the ficial to their growth and maturity, and are almost and midsummer it cannot usually be done .- glass, the plant will incline or bend towards the Whether this arises from the extreme dryness of glass, through which both heat and light are adto the roots during its continuance; or whether seek these aids as a mean of supporting their exmost of the sap that is drawn into them, and istence. thence into the tree, is carried off by excessive

But at a later period, as before tivity in the sap that is so manifest during mid-tree. summer; and which lead many people to believe that its circulations are stopped altogether.

But the principal question is still unanswered, for if you cut through the bark only, the sap will however, examine it a little, and see whether it may not be accounted for by a union of causes .-The querist says he knows that heat affects the ences. circulation of the sap, but wishes to know how it affects it?

the active circulation of their san, there can be no doubt. But heat applied to one part of the plant, while the other is exposed to frost, will affect that part only that is immediately within its influence. This is another proof that the sap remains in the body of the tree, as well as in the knows that the part exposed to the external air May not this answer one, if not two of Mr Cof- will remain without showing any signs of vegetafin's questions, viz. the fourth and eighth? Per- tion; while the branch within will be in full leaf, points in regard to the phenomena of the circulahaps it is not conclusive as to the last. But I do and growing vigorously. If we carry the end of not understand that it is necessary that it should the branch out doors, leaving the centre of it only freeze in the night to induce the sap to flow in within, we shall see that both the lower body and the day-only that when frost is succeeded by a the terminating shoot, which are exposed to a cold warm sun, the sap will flow more abundantly than atmosphere, will remain in a dormant state, while it does ordinarily when there has been a succes- the centre will send forth shoots, leaves, and young sion of warm days, and the sap has been constant. If you reverse the position of the vine, by ly flowing; by which means, perhaps, the organs placing the roots in doors, and leaving the centre mands. that contain the fluid may be exhausted, and may of a shoot out, the effects will be reversed. The require time to replenish themselves. All this, part near the roots, and the terminating branch

Heat then is the principal agent in putting the

If the cellular tissue contains, beside the watery and the sap flows regularly and constantly-more fluid we call sap, a variety of other substances in the day than in the night, because there is which are susceptible of chemical influence; and more heat to aid its circulation. But this seems if, when these are excited by heat, they are set in to show that frost at night is not necessary to its motion, and a change is produced by chemical, or "electro-chemical agency," which decomposes, Is the circulation of the sap permanent during and recombines them, in such manner as to make the warm season? Although trees, generally, the proper juices, or elaborated sap which forms "cease to put out new, or extend their old shoots the annual growth of the tree; why may it not, during midsummer, (that is the latter part of June, by both, or either of these powerful influences, July, and the early part of August,) and the ter- produce such a degree of rarefaction of the air minating buds of the shoots of the year, are, in and sap which is in the capillary tubes, or conmany trees formed; when the heat or dryness ducting vessels, as to extend them, aided by the has passed off, these terminating buds will fre- principles of vitality in the plant, from the roots to

But heat alone is not sufficient to produce the wonderful effects which we see annually in the tainly becomes so sluggish that we find the bark growth of plants of various kinds. The immediwill adhere to the wood, which in the spring could ate influence of the sun and air are highly benesap having resumed its course, the bark can again indispensable to the existence of most plants. If be detached with case, -hence it is, that in both a plant be covered with a box, three sides of spring and fall you can bud trees, while in winter which are closed with plank, and one side with the soil, which furnishes little or no nourishment mitted. This shows the tendency of plants to

The experiments of Dr Hales by means of canillary tubes, carried sup from the top of the stump That most plants are dependant on heat for of a young tree that he cut off transversely in the spring, I think 16 or 18 feet upwards, and this without the aid of heat, or chemical influence of any kind. What then may not be expected from these powerful agents when brought into operation on a set of capillary tubes so minute, in some cases, that a strong magnifying glass is required roots, ready to be acted upon, and set in motion to discover their existence? Beside, when we whenever heat is applied to it. For instance if a consider that this body is endowed with life, while grape vine be planted in the open ground, and a the tubes of Mr Hales were not, we must not wonand why the sap will flow from the south side of branch of it be led into a hot house, every body der, I think, that this theory is supported by some physiologists.

After all, we are still left in doubt as to many tion and elevation of the sap. But much more might be said, and the subject much better elucidated by a scientific writer who had leisure to investigate it; but as I must have exhausted your patience, as I fear I shall that of your readers, I will leave the other questions of Mr Coffin to some one better qualified than myself to satisfy his de-CULTIVATOR,

Brookline, June 1, 1829.

FOR THE NEW ENGLAND FARMER.

POULTRY, &c.

MR FESSENDEN-I am a young farmer and have paid considerable attention to the raising of poultry; and for the purpose of securing my gardens from the depredations of my hens, have enclosed with a wall and pickets, a yard of an acre and an half of ground, in which I keep them shut up; but from some cause or other they have this season done comparatively nothing. Now, I am beginning to think that this results from keeping too many of them together. Will you, or some of your correspondents inform me how many may be kept in such an inclosure, with profit; having a house to roost in, fifty feet by ten, and divided into four apartments.

Last winter, in the month of February, I lost a considerable number of fowls, by a disease, which I do not recollect to have seen treated of in any work on poultry, unless it is that called by Mowbray the Roup. I, however, think it a different disease from that. My hens had their mouths so filled with canker that many of them could not eat, and frequently one or both of their eyes were so swollen that they could not see. Some, which lived cannot now see from one eye. Of course none were cured which were blind in both. After trying several medicines without success, I gave them meal and water, having first dissolved in it a quantity of Glauber's salts, by which I saved some of them. Can you tell me of a better method, and the cause of the disease?

CEDAR FOR HEDGES.

One of your correspondents makes some inquiries concerning hawthorn fences. Would not we shall not undertake to decide. But to us there by which the necessary supply of watery solutions red cedars, or as they are commonly called hawthorn?

LIME FOR DESTROYING BUGS.

In one of your late papers I saw several ways recommended for destroying bugs, worms, &c. I think I may venture to recommend sowing air servations on the subject may be seen page 206 of slacked lime, as the cheapest and most effectual the current volume of the New England Farmethod of ridding gardens of the many kinds of small vermin that infest our vines; though perhaps this is nothing new.

Norwich, Con. May 26, 1829.

Remarks by the Editor .- With regard to poultry it is not in our power to inform how many may profitably be kept in an apartment of the size stated above by our correspondent. The only account we remember to have seen of keeping great numbers in the same inclosure, was quoted from a communication to the British Board of Agriculture, which states in substance, that a Mr Wakefield, near Liverpool, kept a large stock of poultry to great advantage on a plat of land, about threefourths, or nearly an acre in extent, inclosed with a fence of six or seven feet in height, composed of slabs set on one end, or any thinnings of fir, or other trees, split, put near together, and fastened to each other near the top and bottom. These slabs are sharp pointed, and the sharpness of their tops is supposed to prevent the fowls from flying over, although the fence is so low. Within this fence are places slightly put up, but well secured from wet, for each kind of poultry; and a pond, or current of water, runs constantly through it .-Here they are regularly fed three or four times a day with steamed potatoes, with the happiest success, as the fowls thrive perfectly well. What renders this system of poultry management more worthy of attention, is the great quantity of dung made in this place, and, when it is cleared out, a thin paring of the surface is taken off at the same time, which affords a valuable compost.

A writer for the American Farmer, whose communication was republished in the New England Farmer, vol. iii. p. 275, states that "the following method of fattening fowls was communicated to me by a farmer from Buck's county, Penn. who is in the practice of supplying the market with the finest and fattest I have ever seen ;-confine your fowls in a large airy inclosure, and feed them on broken Indian corn and mush, with raw potatoes ent into small pieces, not larger than a filbert : placing within their reach, a quantity of charcoal, broken into small pieces, which he says, they will greedily eat, and thereby promote a rapid digestion them. of their food." It is probable that the charcoal and raw potatoes were useful in preventing diseases in the poultry, as well as in promoting di-

With regard to the diseases of poultry but little has been stated in such books as have come within the reach of our observation. The Roup seems to be a general term applied to all diseases in fowls. "The Pip (according to Mowbray) is a white scale growing on the tip of the tongue, which must be torn off and the part rubbed with salt." Others recommend (and we have been verbally informed that the prescription has been found to be successful) to take a little soft soap and mix it with meal dough, and give it to chickens afflicted with the pip. A portion of animal food, mixed with vegetable food causes poultry to thrive, and is thought to contribute to their health. They eagerly seek for worms and other insects, cellent, but the first specimen left nothing to be

HORTICULTURAL SOCIETY.

At the stated meeting of the Society, on Monday evening last, the members present, and the profusion of superb native, and foreign flowers, and interesting herbaceous plants which were brought, evinced the continued and lively interest taken by the members in promoting the views of the Society and the cause of Horticulture. We omit to mention particulars, as the same plants will probably be shown at the exhibition which is to take place at the Masonic Hall, on Friday

Patrick Hayes, Esq. presented a box containing upwards of two hundred packets of seeds of flowers and forest trees, collected by his son, now resident on the Rio Grande, Brazil.

Dr David Hosack, of New York, presented a box containing several parcels of beans and peas, the growth of Mexico, which had been sent to him by our Minister, Mr Poinsett.

containing a numerous collection of valuable esculent vegetables, collected by himself during a recent tour through Germany. Accompanying these, was another parcel of sea kale seeds.

Messrs Jesson, nursery and seedsmen, of Cheltenham, and Messrs Noble & Son, seedsmen, of London, through Mr Loudon, sent large parcels of seeds of sea kale, rhubarb, and asparagus .-The specific name of the species of rhubarb was not given, but whether it is the medicinal or tart rhubarb, it will be a great acquisition. Experience enables us to say, that both kinds flourish in this state. In five years, a root of the Rheum Raponticum weighed seven pounds, and when dried and powdered, was found to be equal in medicinal effect to any imported.

The asparagus may be an improved variety of that which we already possess. The thanks of the Society were voted for these acceptable pres-

The seeds were partially distributed among the members, and the remainder will be given to those who will be likely to make the best use of

A communication from Hartman Phillips, Esq. of Phillipsburg, Centre county, Pa, on the culture of sea kale. Mr P. finds no difficulty in rearing that fine table esculent, which he has cultivated for ten years past.

The meeting was favored with two bottles of white current wine, by Miss Paschall, of Kingsessing, Philadelphia county, of very superior quality. It was the opinion of many of those who tasted it, that of the numerous samples of currant wine previously sent to the Society, those were decidedly the best. The wines hitherto offered, were made from red currants, which, as noticed in the reports of them, are far inferior for the purpose to the white species; manufacturers of the article are urged to give the latter the preference. One of the bottles of Miss P.'s wine was made in 1811, the other in 1827-both were ex- For 6 lbs. of the 3d best Butter, 6 silver tea

> Our village has for the last week worn very much the appearance of a commercial city. The passing and repassing of trucks and carts, in carrying goods to and receiving them from the boats as they departed and arrived, the landing of bales and hogsheads on the wharves, and the sound of the hammer and saw of the builder, who finds employment on account of this new impulse to enterprise, give the village the stir and bustle of business, which is most animating to the spectator. We have heard internal improvements-rail roads, and canals, called a means of ruining the country. We do not say it is not so, but we most devontly wish that such ruin as has come upon this village, and the country between this and Providence, in consequence of the Blackstone canal, may be increased ten fold .- Worcester Yeo-

At the first semi-annual meeting of the " Salem . Issociation for the Detection and Prosecution of Tresspassers on Gardens, Fields, and Orchards, in the town of Salem and Vicinity," on Wednesday Mr J. C. Loudon, of London, sent a packet last, the following gentlemen were chosen officers for the ensuing year:-

> E. H. Derby, Esq. President. G. S. Johonnot, Vice do G. S. Jononnes, Francis Peabody, Directors. Robert Manning, Samuel Webb, Treasurer. Eben Putnam, Secretary.

The object of the Association is indicated by its name; and the gentlemen composing it, we are informed, are determined to enforce the law in all cases of theft and trespasses in the gardens, fields, and orchards of its members.

London's Gardener's Magazine says, "we are sorry to observe that the practice of pinching off potato blossoms is not generally adopted, as the produce would thereby be increased. A correspondent has found from experience that the crop is not only increased, but is much better in quality; and wishes us to direct the attention of our readers to the practice, which we hereby do, fully convinced of its importance."

Destruction of insects by tobacco water .- In the process of preparing tobacco for use, a liquid is expressed from it, which is very cheap, and highly destructive of animal life. This mixed with from three to five parts of water, is found, by a writer in the Transactions of the London Horticultural Society, to be an effectual remedy for the aphis, caterpillars, and similar insects which infest fruit trees .- Manufacturer's Journal.

Premiums on Butter .- The following premiums are offered by the Committee for the encouragement of the Clinton Market, New York. For 6 lbs, of the first best Butter, a silver cup,

For 6 lbs. of the 2d best Butter, a silver milk

pot, werth spoons, worth

BEE WORM, OR MOTIL.

We have been told, (and indeed we are satisfied of the fact from personal observation) that the bee worm or bee moth, has been very destructive to the bees in this part of the country. We have seen whole hives destroyed by them. Each cavity of the comb is found to be occupied by a round black worm, about the size of a large bee's body: some of them appear to us like a winged insect, in its chrysalis state; the mouths of the cavities containing the worms, are closed by a kind of web, not unlike fine cotton. We have seen a method of destroying these moths prescribed, which we subjoin:

"Instinct teaches the bee moth to secrete herself during the day, in the corners of the hive .-All, therefore, necessary to be done, is to take such advantage of this fact as that this most pernicious enemy shall rush to its own destruction. For this purpose let the orifice of the hive be four inches wide, and one inch high. At the commencement of the season for the moth, place a shingle on the bottom or floor of the hive. You will find in the morning that almost every moth has taken refuge under it. They are readily despatched. This is the mode I have practised with my own bees, and not a single hive has been injured."-Western Carolinian.

Best Method of Raising Radishes .- Most of our garden grounds are too rich for the radish; and but few gardens are found that do not contain more or less of the wire worm. The radish is our favorite. Hence we are induced to make experiments until we have raised them at least semitransparent, and as brittle as glass. Our method is, merely to mix two parts of sand with one part of common garden earth, and add a small quantity of stable manure. Or, earth of a clayey nature is preferable to the garden earth. Since adopting the above method we have not failed in a single instance of raising an abundance of smooth, clear, and fine flavored radishes .- Hingham Gaz.

From the Taunton Advocate.

BROTHER JONATHAN-I know your great autipathy to everything new, or in the least savoring of improvement in agriculture-therefore 1 shall venture on the present subject with but little eenfidence of rousing your attention-for the subject is improvement. Instead of making "two spears of grass grow where one grew before," it is to make three grow where one would hardly grow before. You must needs know that some half a dozen years since, the Hon. John Lowell, of Roxhury, imported a small quantity of Lucerne seed from Europe, with a view of testing its qualities as a grass for this climate-and after a lause of this term of time, which has included the warm winters, and the cold winters-the hot, the cold, the dry, and the wet summers-consequently including the seasons and climates of the world-he gives his unhesitating approbation of its value as a valuable grass for this part of the country. It appears to defy the extreme cold of winter, and the wilting droughts of summer-its term of health and vigor is from ten to twelve years, while that of the common clover is but two or three years; and what is singular in this species of clover, it requires three cuttings, which will average two and a half tons to the acre at a cutting.

On good land, and well prepared, eight tons is

considered a moderate yield to the acre, at the to its composition in a medical journal. answer well except a stiff clay land, or land very low and inclining to bake in summer.

prepared by two or three deep ploughings, and the manure ploughed in at the second ploughing; it should be sown with oats or barley, at the rate of fifteen or twenty pounds to the acre. The seed of his nostrum. can always be had at the N. E. Farmer office, at from 38 to 50 cents the pound.

that it will be profitable to improve your breed of num, disguised, as are most quack preparations, cows for the milk market, as you undoubtedly will, this kind of grass will be a great acquisition in the furthering that object, as it is very esculent and pills had obtained a currency. nutritive; properties essential to the yield of

of the seed, and select forty rods of your good kind of land, such as yields a fair crop of corn, and proceed according to the directions above, and if you repent of the undertaking in the summer of 1830, you may bring an action against me for damage, which I promise to pay without litigation, through the medium of the Advocate office.

Taunton, May 20, 1829. VERITAS.

MEDICINES.

A physician who should in all cases confine himself to the use of "simples," might be justly accounted a simple-ton. We believe, however, that most physicians prescribe medicines much more sparingly than formerly, and would use fewer still, were it not that some of their patients will not be satisfied without frequent doses .-There are people who would gladly swallow about half a peck of medicines per week.

There is, perhaps, no department of knowledge that has been so clogged with false facts and false experience, as that which treats upon the virtues and properties of medicinal substances; and the uncertainty which attaches to the subject has afforded the designing imposter the finest field for knavery and deception. Even where the physical properties of a substance are well understood, a physician can seldom determine with certainty what its direct effect and secondary consequences will be, on the living body. The operation of a medicine is very different in one individual from what it is in another, and it is even quite different in the same individual at different times. The state of the body is not only different in different persons, but it is perpetually varying in the same person. After millions of experiments, and two thousand years experience, not a single specific or absolute remedy for a disease has been discovered. The application of specific cures to diseases, without respect to the state of the patient, or peculiarities of each case, is the essence of quackery. The whole system of euring diseases by printed directions, without regard to the causes of symptoms, the history of the case, the state, habits, and constitution of the patient, is quackery .-Of the numerous quack medicines advertised in the newspapers, some give relief in some cases, but are injurious in others; some do very little good or harm; and some are pernicious in most

AMERICAN PATENTS GRANTED IN JAN-UARY, 1829.

For a manner of Preparing White Lead for Painting without grinding; John Barney, New Haven township, Hnron county, Ohio, Janua-

This is a process for rendering white lead miscible with oil, without the trouble of grinding .-The means prescribed are simple; the paint according to the declaration of the patentee, dries with a finer surface than that from ground lead; whether it will stand equally well, requires the test of time. Being a recipe, we do not publish it without permission.

For Drying Cut Tobacco, in tobacco factories; George Campbell, Schenectady, New York, Jan-

The patentee states that it has, heretofore, been the practice of tobacconists to dry their cut tobaceo upon tables of the ordinary construction, which in large establishments, demands a great deal of room, the want of which produces much delay. The improvement for which the patent is obtained, is the use of a number of tables placed one above the other, allowing an interval of five inches between each. They may be variously constructed, so as either to be moveable, or stationary, with, or without framed corner posts, &c.

In the plan represented in the drawing, all the tables are made to let or lower down, so as to lie flat upon the lower table; the upper one is then covered with tobacco, and raised into its place, and the whole in succession, changed in the same lumbia county, New York. Assigned to Jona. J. Coddington, New York, January 13.

This plough, as its name indicates, is to be applied in bogs, or meadow ground, only. Infancy of Knowledge .- Mankind at the beginning of the 15th century, are thus described in the Liverpool Observer.

"They had neither looked into heaven nor earth, neither into the sea nor land, as has been done since. They had philosophy without experiment, mathematics without instruments, geometry without scale, astronomy without demonstration.

They made war without powder, shot, cannon, or mortars; nay, the mob made their bonfires without squibs, or crackers. They went to sea without compass, and sailed without the needle, They viewed the stars without telescopes, and measured altitudes without barometers. Learning had no printing press, writing no paper, and paper no ink. The lover was forced to send his mistress a deal board for a love letter, and a billet doux might be of the size of an ordinary trencher. They were clothed without manufacturers. and their richest robes were the skins of the most formidable monsters. They carried on trade their merchants kept no accounts, their shopkeepers no cash book; they had surgery without anatomy, and physicians without the materia medica; they gave emetics without ipecacuanha, and cured agues without bark."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JUNE 12, 1829.

The able article which commences this number of the N. E. Farmer, on the "Circulation of San in Trees," &c., will be found worthy of attentive perusal. It not only furnishes proofs of acute investigation, but presents valuable materials for further inquiries. An accurate knowledge of the theory of vegetation cannot fail to afford practical results of the greatest utility. By ascertaining the manner in which Nature conducts her operations, in giving existence to the vegetable kingdom, we may apply the rules of Art with an assurance of the most beneficial results.

FARMERS' AND GARDENERS' WORK FOR JUNE.

If the season be at all dry, your garden vegetables will need water. A copious supply of water is very essential to a kitchen garden. It is said by Loudon that " Many kitchen crops are lost, or produced of very inferior quality for want of watering. Lettuces, and cabbages, are often hard and stringy; turnips, and radishes do not swell; onions decay; cauliflowers die off; and, in general, in dry seasons, all the crucifered become stinted, or covered with insects, even in rich, deep soils. Copious waterings in the evenings, during the dry seasons, would produce that fulness and succulency which we find in the vegetable productions in the low countries, and in the Marsh Gardens at Paris, and in England at the beginning and latter end of the season. The vegetables brought to the London market, from the Neat's Houses, and other adjacent gardens, where the tended to than in private country gardens, may ders, be adduced as affording proofs of the advantage of the practice."

HOEING.

"The ends to be answered by hoeing are

would rob the cultivated plants of most of their food. Scraping the surface, if it be done frequently, may answer this purpose; but to destroy the roots of weeds deeper hoeing is neccssary.

2. To keep the soil from becoming too compact, which prevents the roots from extending themselves freely in search of their food; at the same time keeping up a fermentation, by which the vegetable food is concocted, and brought into contact with the roots. For this purpose the deeper land is hoed the better. But hoeing should cease or be only superficial, when the roots are so far extended as to be much injured by the hoe. They will bear a little cutting without injury. For where a root is cut off, several new branches will come up in its place.

3. To render the soil more open and porous, so that it shall greedily drink in the nightly dews, and that rain may not run off, but readily soak in as it falls, and be retained. Accordingly the more without books, and correspondence without posts; and oftener land is heed, the more its plants are

> 4. Another design of hoeing, and which has not been enough attended to, is to nourish plants by drawing fresh soil near to them, the efflusium of which enters their pores, and increases their growth. At the same time the earthing of plants makes them stand more firmly, increases their pasture in the spots where the roots most abound: and prevents the drying of the earth down to the roots."-Deane. Another writer says "Thin out and earth up all your plants; remember that frequent hoeing is both rain and manure to your vegetables in dry weather."

CUT WORMS.

Dr Deane directed as follows: " If you perceive any melon, cabbage, cauliflower plants, &c. injured by the cut worm, open the earth at the foot of the plant, and you will never fail to find the worm at the root, within four inches. Kill him, and you will save not only the other plants of your garden, but many thousands in future years."

TAR FOR SHEEP.

A gentleman, who keeps a large flock of sheep, assures us that during the season of grazing, he gives his sheep tar, at the rate of a gill a day to every twenty sheep. He puts the tar in troughs. sprinkles a little fine salt over it, and the sheep consume it eagerly. This preserves them from worms in the head, promotes their general health, and is thought to be a specific against the rot.

MASSACHUSETTS HORTICULTURAL SO-CIETY

The following donations have been received for this Society since their last meeting:

From Anore Parmentier, Esq., proprietor of the Horticultural Garden, New York, a variety of seeds of European grasses, comprising the Rough Seeded Spurrey, of Flanders, (Spergula arvensis,) Meadow Soft Grass, (Holcus Lanatus,) English Rye Grass, (Lolium perenne,) Yellow Meddick, (Medicago fulcata,) Field Burnet, for Sheep, (Poimportant article of watering is much more at-

The following persons were admitted members, at the last meeting : Ebenezer Seaver, Jr, Roxbury-John P. Rice, Esq. Boston-Ebenezer T. Andrews, Esq., Boston-Gen. Aaron Capen, Darchester-Otis Nichols, Dorchester-Benj. Thomas, Esq., Hingham-John Perry, Sherburne, and Rev. Gardner B. Perry, East Bradford.

The Seeds and Roots will be distributed at the meeting tomorrow, -(see advertisement.)

(A very convenient and spacious room has been fitted up, over the counting room of the New England Farmer, No. 52 North Market Street, for the use of the Society. The room is furnished with various agricultural, and other periodical journals, and is open at all hours of the day for the use of members. At this room will be deposited all seeds, scions of superior fruits, drawings of fruits, new implements of use in horticulture, books for the Library of the Society; and all fruits, vegetables, or ornamental flowers that may be offered for the premiums of the Society.

MASSACHUSETTS AGRICULTURAL SO-CIETY.

This Society, which has exercised an influence so important and beneficial on the agricultural interests of this commonwealth, was incorporated in 1792, and a fund subscribed, amounting in donations alone, to 3984 dollars. Among the donations at the incorporation of the Society, were the following-Governor Gore, \$1000; Hon. Thomas Russell, \$1000; Hon. James Bowdoin, \$400; Andrew Cragie, Esq., \$400; David Sears, Esq., \$200; Joseph Barrell, \$200; Thomas Lee, Esq., \$200; Patrick Jeffrey, Esq., \$200; S. W. Pomeroy, Charles Vaughan, J. C. Jones, and Samuel Eliot, Esqrs., \$100 each; Doct. Lettsom, of London, the celebrated philanthropist, gave ten guineas. The funds of the Society now amount to about \$14,000. The amount of premiums given by the Society, since the establishment of the Cattle Shows, have averaged about \$1200 each year.

Method of preventing milk from turning sour.— Put a spoonful of wild horse radish into a dish of milk; the milk may then be preserved sweet, either in the open air, or in a cellar, for several From Grant Thorburn & Son, of New York, days, while such as has not been so guarded will . From the Worcester Ægis.

THE SUN FLOWER.

The muse of History has not preserved the name of the benest Dutchman, who first introduced the sun flower to garison the garden, and stand sentinel of its outposts, smirking with its great, bread, good humored face, at every passer, and beuding to the day star with Eastern adoration; and herein has history been faithless to the benefactors of our race, as in the many other matters where she neglects departed worth, or inscribes lying legends instead of selemn truths on the page. The goodly sun flower unlike the gay dandies of the earlier months, who come parading out in their coats of many colors, on soil of aristocratic refinement, is a plain, simple republican in his lory, habits, and he grows as fair, and as tall, and as goodly to see, when he plants himself by the way side, as when he looks down in the delicate company of the peony, or the tulip. An upright gentleman is he too, looking boldly round him with the consciousness of merit: and as liberal and free as he is beautiful; imparting food and shelter to the birds that nestle under his leaves in the autumnal storms, with the munificence of a generous patron.

Of all the scenes of grandeur on which the eye rests, commend us to the view of a squadren of sun flowers. Who has not seen the warriors of the militia, spreading in long line, or gathering in column, bristling with burnished steel, nodding with plumes, and girt so tight with belt and buckle as not to be able to draw breath but once in every three steps? And who has not felt that it was a sublime sight, as the pageant rolled by with the flash of sun beams on sword and bayonet -and banners floating out to the beat of drum, and the clang of trumpet, and many a pound of warranted live geese feathers, tied to a stick dancing over helmet, cap, and bonnet. But what is all this, to the splendor of a regiment of sun flowers, with their broad disks, and yellow fringes gathered round the home of the husbandman.

Learned philosophers have stated that the effect of familiarity is to deaden our feeling of wooder and surprise. From this principle it is that bright eyes look, and red lips speak, without admiration of the goodly flower of the sun. The taste and fashion of the time is for things dearly bought and far brought. Let some adventurer furnished with a dozen seeds from some of the stately heads of the citizens of the garden, provide a name which cannot be spoken—and a price which few can pay, and our honest friends would walk into parlors, and set on carpets, and affect to grow delicate and gentlemanly as favored exertics.

We like the consistent political course of our leafy friend who turns his face alike to the declining and rising sun: who if he may occasionally loll over the fence, does not rest there because he cannot stand alone.

The goodly plant unites utility with elegance. The oil extracted from the seed may be burnt in the lamp of the student—spread on the plate of the epicure, or bestowed on the painter's canvas—the flower cups fornish an esculent pleasant to the taste, and honey of delicious flavor—and the stalks afford the materials for hemp, to hang rogues, and fasten horses. We know not but its cultivation for sugar would be as much an improvement in New England husbandry, as the

growth of the beet for that invaluable purpose, which has been recommended by the savans of France.

Brighton Cattle Market.—Monday, June 1, 1829. The number of beef cattle 120, sold from \$5,50 to \$6,50 per hundred. All sold by 9 o'clock, A. M. Sales, 50 cents per hundred more than any preceding week for the year past.

Mustard Seed.—I have often been surprised that this article so easily raised, should not be more extensively cultivated; it would certainly pay well, as I believe the Flour of Mustard, is now retailing at 75 cents per lb. It is altogether surprising that we should still be importing this article in its manufactured state.—Ohio Repository.

Quarterly Review. The last number of this valuable and interesting work has just been republished by Wells & Lilly, and contains articles on the following subjects:—Life and Writings of Dr Parr—New Colony on Swan's River—Judge Hall's Letters from the West—Surtees' History Durham—The Journal of a Naturalist—Currency—Mechanical Philosophy—State and Prespects of Great Britain—New Publications—Price §5 per

The season was never so backward as it is this year, in the neighborhood of Dublin, and Ireland generally; but we have been informed, that there are fewer cases of fever at present in the hospitals, than were ever before known at this period of the year. We need not observe, that a late season is always considered auspicious to the hopes of the agriculturist in this climate.—Dublin Morning Chronicle.

Mr S. G. Reynolds, of Bristol, R. I. has invented, patented, and put in operation, at Pawtucket, a machine for manufacturing wrought nails, by water power. A complete and substantial head is formed to the nail, with a smooth and exact taper, preferable to those wrought by hand. Mechanics speak highly of it.

NOTICE.

There will be an adjourned meeting of the Massachosetts Horticultural Society, at the HORTICULTURAL HALL, over the counting room of the New England Farmer, on Saturday next, the 13th inst, at 11 o'clock, A. M.

Members are requested to be punctual in their attendance. R. L. EMMONS, Rec. Sec'y.

Boston, June 10th, 1829.

Stone and Aqueduct Pipe.

A further supply of this very useful and necessary article for anything used for the purpose, is for sale at the Agricultural Warehouse, No. 52 North Bartier Is for sale at the Agricultural Warehouse, No. 52 North Bartier the where orders are received for a supply of any quantity or size wanned, with turns and circular pieces to match. J. R. NEWELL, Agent for Stone Pipe Corporation Company.

Buckwheat, &c.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Market Street,
A few hushels of Buckwheat, growth of 1828. Also, a further supply of Fowl Meadow Grass Seed, of superior quality.

New China Tea Sets, and light blue Dinner Ware. Ruccived, a great variety of the above; which, with a complete assortment of Crockery, China, and Glass Ware, are offered for sale, low, at No. 4 Dock Square.

Seed Potatoes.

For sale, at No. 26 Foster's wharf, 200 bushels of superior Nova Scotia Potatoes. A fine opportunity is here offered to farmers, who wish to improve the quality of their seed potatoes.

Millet Seed.

For sale at the Seed Store connected with the New England Farmer, No. 52 North Market street.

50 bushels of Millet Seed,—clean, and of superior quality.
Also, a very extensive variety of Ornamental Flower Seeds, in papers of 6 cts each, or 100 varieties, one paper each, for \$5500.

ROMAN—This elegant, full blooded horse, a bright bay, with black legs, mane, and tail, of high spirit and good temper, will stand at the farm of Mr Stephen Williams, in Northborough, Ms, at \$200 the season, to be paid before the mares are taken away—See New Bugland Farmer, May 16.

Red and White Clover Seed.

For sale at the New England Farmer Seed Store, No. 52 North Market Street,

500 lbs. Dutch White Honeysuckle Clover, (imported.) Also, Herd's Grass, Red Top, Orchard Grass, Lucerne, Foul Meadow, Hemp and Flax Seed, &c, &c. March 27

FARM for sale in Milton, of about 200 acres, remarkably well watered, with every variety of lands and fruits, good substantial buildings, and a large portion of valuable woodland—Also, for sale, or to let, opposite to the above anmed premises, a large dwelling louse, with a good bake house, very pleasand stated.—For further particulars, see the New England Farmer of May 15,00 inquire of the publisher, or F. H. Pierce, 55 May 22, 1625.

Imported Horses.

Barefoot, and Cleveland, the two English horses, will stand for the season at their stable in Brighton. Barefoot at \$25, and Cleveland at \$10, with \$1 for the groom. a24

MISCELLANIES.

THE SWEET BRIER.

BY BRAINERD.

Our sweet autumnal western-scented wind Robs of its odors none so sweet a flower. In all the blooming waste it left behind, As that the sweet brier yields it; and the shower Wets not a rose that buds in beauty's bower One half so lovely, --- yet it grows along The poor girl's pathway---by the poor man's door. Such are the simple folks it dwells among; And humble as the bud, so humble be the song.

I love it, for it takes its untouch'd stand Not in the vase that sculptors decorate---Its sweetness all is of my native land, And e'en its fragrant leaf has not its mate Among the perfumes which the rich and great Buy from the odors of the spicy east, You love your flowers and plants--- and will you hate The little four leaved rose that I love best, That freshest will awake, and sweetest go to rest?

TEMPERANCE.

Would you extend your narrow span, And make the most of life you can; Would you, when med'cines cannot save. Descend with ease into the grave : Calmly retire like evening light, And cheerful bid the world good night? Let temperance constantly preside, Our best physician, friend, and guide. Would you to wisdom make pretence. And be esteemed a map of seose? Let temperance, friend to wealth and fame. With steady hand direct your aim; Or like an archer in the dark, Your random shaft will miss the mark, And while life's thorny maze you trace, Still seek renown but meet disgrace.

Olden Time in Massachusetts .- In 1627, there was but 37 ploughs in all Massachusetts, and the use of these agricultural implements was not familiar to all the planters. From the annals of Salem it appears, in that year, it was agreed by the town to grant Richard Hutchinson 20 acres of land, in addition to his share, on condition "he set up ploughing."

1630. A sumptuary act of the General Court prohibited short sleeves, and required the garment to be lengthened so as to cover the arms to the wrists, and required reformation "in immoderate great breeches, knots of ribbon, broad shoulder bands, and tayles, silk rases, double cuffs, and ruffs."

1639. "For preventing the miscarriage of letters, it is ordered that notice be given, that Richard Fairbank, his house in Boston, is the place appointed for all letters, which are brought from beyond the sea, or are to be sent thither, are to be brought unto him, and he is allowed for every through his own neglect in this kind, provided that no man shall be obliged to bring his letters thither unless he please."

1647. The Court order, that if any young man nothing. I have sold hats for the last twenty years, and my trick was never found out till ent of her parents, or in case of their absence, of e County Court, he shall be fined £4 for the first Fence, £10 for the second, and he imprisoned for e third.

1649. Matthew Stanley was tried for drawing the first formula of the second and the imprisoned for drawing the first formula of the second and the imprisoned for drawing the first formula of the second and the imprisoned for drawing the first formula of the second and the imprisoned for the second and the imprisoned for drawing the first formula of the second and the imprisoned for the second and the imprisoned for the second and the imprisoned for the second and the imprisoned for the second and the imprisoned for the second and the imprisoned for the second and the imprisoned for the second and the imprisoned for the second and attempt to address a young woman without consent of her parents, or in case of their absence, of the County Court, he shall be fined £4 for the first offence, £10 for the second, and he imprisoned for the third.

in the affections of John Tarbox's daughter, without the consent of her parents, convicted, and fined £5: fees 2s. 6d. Three married women were fined 5s each, for scolding.

great boots, but was acquitted .- Nat. Æris.

An Innkeeper's Regret .- Joseph II. Emperor of Germany, travelling incognito, stopped at an Inn in the Netherlands, where it being fair time, and the houses crowded, he readily slept in an outhouse, after a slender repast of bacon and eggs, for which and his bed he paid the charge of about three shillings and sixpence, English. A few hours after, some of his Majesty's suite coming up, the landlord appeared very uneasy at not having known the rank of his guest. 'Pshaw, man,' said one of the attendants, 'Joseph is accustomed to such adventures, and will think nothing of it. 'Very likely,' replied mine host, 'but I shall-I cannot forgive myself for having an Emperor in iny house, and letting him off for three and sixpence.

Sleep .- The capacity for sleeping, like the capacity for eating and drinking, is to be increased by indulgence. Much depends upon habit. Some people can sleep when they will, and can wake when they will; and are as much refreshed with othy, Orebard Grass, Oat Grass, Herds Grass, &c. a short nap as a long one. Sea-faring people have this property from education. One gentleman, who entertained a notion that a second nap was injurious, invariably got up as soon as he awoke, no matter how early the hour-winter or summer. Others, again, will sleep for four-andtwenty hours. The celebrated Quin had this fac-nlry. What sort of a morning is it, John?— Also, the Apple Seeded Meloo, a very early variety. 'Very wet, sir.' 'Any mullet in the market?"-'No, sir.' 'Then, John, you may call me this time tomorrow.' So saying, he composed himself to sleep, and got rid of the ennui of a dull day in the arms of Morpheus.

War Horses .- General Washington had two favorite horses; one a large elegant parade horse of a chesnut color, high spirited, and a gallant carriage; this horse had belonged to the British army: the other was smaller and his color sorrel. so that whenever the General mounted him, the price 371-2 cts. word ran through the ranks, we have husiness

At the battle of Germantown, General Wayne rode his gallant roan, and in charging the enemy, his horse received a wound in his head, and fell, and was supposed dead. Two days after, the roan returned to the American camp, not materially injured, and was again fit for service.

There's tricks in a' trades but ours, (as the lawyer said to his client.) An honest rustic went into the shop of a Quaker to buy a hat, for which 25s. was demanded. He offered 20s. 'As 1 such letter 1d., and must answer all miscarriages live, said the Quaker, 'I cannot afford to give it thee at that price.' 'As you live!' exclaimed the countryman, 'then live more moderately.' 'Friend,' said the Quaker, thou shalt have the hat for nothing. I have sold hats for the last twenty

care of his horses, he discovered a rattle snake, about two feet long, with six rattles, occupying the seat on the load which he himself had occupied in travelling four or five miles. Some per-1653. Jonas Fairbanks was tried for wearing sons might conclude that the object of his visiting our village, was to obtain employment; as a late member of the House of Representatives from Georgia, in a speech against the tariff, declared the manufacturers to be a set of reptiles. But it is more likely, however, that he had concealed himself in a hollow stick of wood, was put on the wagon unnoticed, and after arriving at Mulica Hill, had placed himself in the seat of Mr Doran, for the purpose of viewing more minutely, the singular appearance which the place presents to strangers .- Woodbury, N. J. Herald.

AGRICULTURE.

SALT AS A MANURE (By tife Editor.)

There have been few subjects, relating to agriculture, which have been more controverted than the question relative to the value of salt as a manure. To recommend salt as a fertilizer, pamphlet of the most dogged disciple of dulness, that ever dozed after dinner, have been poured out on a patient public, from "time whereof the memory of man runneth not to the contrary," down to the present enlightened period. But, notwithstanding salt has been so highly extolled, the sentiments ofthe most scientific and experienced cultivators, who have written on the subject, within the last eight or ten years, have been against its use as an subject to the saline influences of the sea must be? come as rich as if they were pervaded by the drainings from a farm yard. Cape Cod would be as fruitful as " Araby the blest," and many a mile surface.

A writer in the "Farmer's Journal," printed in London, is treating of the value of common sair wi a manure, states that " A rich sandy loam, a poor soil were severally manured with salt. Each variety of soil was treated and cropped in the same way. On each of these soils salt was applied in various proportions from five to sixty bushels per acre, and upwards; these proved to be two extreme points; for five bushels per acre were productive of no apparent effect whatever, while sixty bushels produced absolute sterility.

"To grass land the salt was applied by scattering it over the surface with a shovel, in the mauner of applying powdered caustic lime in its simple | ed. state. It was applied to the grass land in October, and also in March.

"To the soils above mentioned, in tillage, sult was applied as follows :- Ist, simply by itself; 2d. combined with lime; 3d, combined with spit

manure; 4th, combined with long dung; 5th, combine I with oil-cake dust.

"The mode of application was also varied as follows:-Ist, by scattering it on the surface simply, and also combined with manure, and ploughing it in previous to sowing the seed; 2d, depositing it (in these different states) in the seed bed along with the seed ; in some instances broadthe surface after the vegetation of the seed, or of the appearance of the plants above ground. Different proportions of salt and spit manure, long dung, and of clay, were also respectively mixed decomposition, either as hastening or retarding its over richness of soil.

rogress; similar heaps of these substances simp-| by or without salt, being placed side by side, for feets of salt core than any other of the crops of obtaining comparative proofs. 1 above named. A smaller quantity than 60 bushmay also add that salt in solution of various de- els of salt per acre, sown with the seed, rendered arees of strength at the proper season, was applied the soil so barren that it retarded the vegetation es a topical remedy for the rust disease of wheat, of the beans and flax. Carrots hardly seemed to

"The general result of all the trials, which

the oily seed crops.

ere continued three years, proved that five bushels of salt per acre, under any circumstance of soil, mode of application, or kind of crop, had no sensible effect whatever on the growth of these different crops; and that when the quantity of sait applied reached to 60 bushels per acre, vegeation did not take place at all, but absolute sterapplication to land. They say, in substance, if you was the consequence at all, the assume the salt alone, were in all eases a valuable manure. salt alone, were in all cases a valuable mariner. Top should have been reaped, the seed was found we could have no barren sea coast. All lands in the soil in as sound and perfect a state as when sown in the preceding spring. This quantity of salt, however, when mixed with spit manure, and oug in, previous to sowing the seed, proved less iniurious, as a few seeds vegetated and grew. In of naked beach, which hardly exhibits a trace of the following spring, this piece of land, rendered vegetation, would be as fertile as any mixture of barren, by the application of 60 bushels of salt apsoil and manure can possibly render the earth's wifed with the seed, was dug and sown with the graips; the seed vegetated some days later than sown on the adjoining land, to which no salt illi book appited; but the turnip fly made its appearance on the salted and unsalted land at the sandy soil, a strong clay, and a barren peat-moss same time, and was equally successful in its ravages on both crops. In every other trial, salt proved of no use whatever in preventing the turnip fly, or checking its destructive progress. The next following spring the land was sown with perennial red clover; and comparing the vegetation of this seed, and the progress of the plants, on the previous sterile land, with those sown on the unsalted land adjoining, the progress of the plants on each land was so uniform and equal as to prove that the sterile effect of the salt had disappear-

> "The various modes of applying salt above mentioned, and the various kinds of crops submitted to its influence, all tended to confirm opinion, or rather prove it to be a fact, that salt retards the vegetation of seeds, and if applied in too great a quantity destroys vegetation altogether; and that salt renders manure, properly so called, less active and less heneficial to the plants; and also, that the sterile effect to the soil is not lasting.

"The only benefit accruing to tillage land from the application of salt, was apparent in the instance of the rich clayey loam, and rich sandy soil; here the straw was light and the sample cast, and in others in drills; and lastly, applied to fine; the produce from the same soils without salt, consisted chiefly of rank straw, with a light shrivelled sample of corn. The fact was that the soil was too rich and highly manured to grow corn, surface of my shallot ground, after the shallots and the salt in this instance, so far reduced its up in heaps, and suffered to remain for several over fertile state, as to render it suitable for the months, in order to ascertain whether any, or what production of grain. Farmers, however, I bechange might be effected by salt in the process of lieve, have seldom reason to require a remedy for

"Beans avil flax seemed to feel the sterile ef-"The grain or white straw crops manured with feel its effect. "fter the vegetation of the seed; elt, were wheat, barley, oats, rye and Indian the fact is, that this root penetrates deep, and soon passes beyond the reach or influence of the salt when applied with the seed, or to the surface of the land.

"When salt was applied to grass land at the rate of five hishels per acre, no effect whatever was perceptible; but when applied at the rate of from 60 to 100 bushels per acre, the grass was speedily destroyed, and did not again recover for that season, her indeed till fresh grass seed had been sown and a top dressing of manure.

"The rust in wheat generally makes its appearance just about the period when the wheat comes into flower. Solutions of salt of various degrees of strength were applied to the crop previous to any appearance of the disease, and also after the symptoms became confirmed. A very weak solution had no effect whatever, and a solution strong enough to destroy the fungus, or rust, destroyed

also the plant of wheat itself.

"Common salt in a state of perfect purity consists of sods 41, muriatic acid 50, and water of crystalization 6-100; but then common salt, such as we buy it, even for culinary purposes, is never pure, but at hined with various proportions of nauriate of the media, sulphate of magnesia, and sulphate of hare; the first mentioned substance is very deliquescent, and attracts moisture from everything near it; hence the appearance of land where common salt has been applied; after rain it appears dark colored and damp; during dry sunshine, white and powdery. A consideration of the nature of neutral salts, and of the vegetable economy, might have led us a priori to the conclusion which the actual experience of salt, applied as a manure has demonstrated."

The above experiments appear to have been made with care, very much diversified, on a large scale, and for the express purpose of ascertaining what value, if any, can be attached to salt as mannre. The result was not in favor of salt, either as a fertilizing substance, a preservative against mildew, or a destroyer of insects. Other trials both in Europe and America give corresponding results. Mr William M'Martie states in Loudon's Magazine, vol. iv. p. 456, that he tried salt on half his carrot grounds, at the rate of a cubic inch to a square yard, and that "the part that was salted did not differ at all in appearance from that which was not, with regard to the growth of the tops. When the crop was taken up, I could not perceive that there was the slightest difference in the two parts; therefore, it would appear that that quantity of salt to a square yard does neither good nor harm. I sowed the same proportion upon the were above the ground, with the idea that it would prevent that rot at the roots, which they are so subject to; but I could not perceive that it had any effect whatever. In the month of March, I also sowed four square yards of grass with salt,

in the pleasure ground, to see what effect the different proportions would have on its growth. In the first yard I strewed one cubic inch over it; in the second two; in the third three; and in the fourth, four cubic inches. In the first and second yards the salt had no perceptible effect; in the third yard it rather retarded the growth for a short time; but the effect the quantity had upon the fourth yard was very plain indeed, turning it quite yellow in about ten days after it was put on. It was not sufficiently powerful to kill either the moss or grass, which continued in that sickly state till autumn; and at this moment I cannot perceive the slightest difference in the appearance of all the four yards.

"I have used it successfully, put on in a large quantity, in destroying weeds on approach roads; but it must be done annually, to have the effect of keeping such constantly clean. I would not recommend its being laid on garden walks for that purpose, as I lately witnessed the box edgings of a garden completely destroyed by in In paved courts, or stable yards, it might be used successfully in destroying the grass, weeds, &c.; and being now so cheap an article, it would be a considerable saving compared with hand weeding. In short I have a higher opinion of its destructive qualities than its vivifying properties, at least as far as I have seen it applied."

J. Kenrick, Esq. of Newton, Mass., in a communication, published in the N. E. Farmer, vol. iv. p. 138, states "I dissolved a bushel of rock salt in water, and with a water pot applied it on a part of my nursery, where the rows were four feet apart, and the ground much inclined to weeds, at the rate of 16 bushels to the acre. I also made an experiment in another part of the nursery, where the soil was different, and a soft loam, by sowing two bushels of coarse-fine salt, at the same rate of sixteen bushels to the acre. Again I made another trial, by sowing a single quart on a square staked out, upon a knoll I had just sowed with hay seed, and Indian corn for fodder, and rolled down, and in the same proportion to the acre. I know not what appearances may be in future; and can only say, no sort of effect has been visible as yet."

A writer for Loudon's Magazine, vol. v. p. 444, in an article dated Philadelphia, May 1828, says "Common salt has been tried here on asparagus, but the effects found quite otherwise than very beneficial."

It would be easy to multiply testimony for as well as against the use of this article as mannre; but we believe the majority of modern authorities are against its use.

Manuring land is providing food for the vegetables which you intend shall grow on the land manured. You can no more feed your plants with salt than you could your sheep, and horses. Salt is a condiment, like pepper, and spice, not an article of food, like roast beef, and boiled potatoes. Salt is not an article in great demand by a growing vegetable, because but little of it can, enter into the composition of such vegetables. Vegetables are composed, principally of carbon, (coaly matter) and carbon is the chief constituent of barn yard, and other manures which are most essential to the growth of plants.

Baltimore and Ohio Rail Road .- A very rapid progress is making in this work. The amount of excavation and embankment, already executed, is two or three times in the summer—it changes the common scythe; and instead of a cradle, has stated to be very considerable.

FOR THE NEW ENGLAND FARMER

PRESERVING SMOKED MEATS, &c. MR EDITOR-A reply to the following query a few weeks ago, when I was putting away my smoked meat for the summer, might have been useful to me; and indeed it may yet be useful to me and others.

What is the best possible mode of preserving hams and other smoked meat from flies?

SAM'L TYLER. Yours, &c., Attleborough, May 21, 1828.

Remarks by the Editor .- We will mention several methods, which have, we believe, been successfully put in practice for the purposes stated by our correspondent.

The Hon. THOMAS GOULD, formerly President of the Berkshire Agricultural Society, in a communication published in the New England Farmer, vol. i. p. 275, observed, "Much experience has enabled me to offer you a prescription for preserving smoked meat from the ravages of all small animals, and pure and sound for any length of time, and in any climate. It is the use of CHARsmoked meats is this: Take a tierce, or box, and pieces, but not to dust; cover the legs or pieces of meat with stont brown paper, sewed round so as to exclude all dust, lay them down in the coal in compact order, then cover the layer with coal, and so on till your business is done, and cover the top with a good thickness of coal.

is of great benefit in preserving fresh provisions, butter, and fruits in warm weather, also in recove ering meats of any kind, when partially damaged by covering the same a few hours in the coal.-Let those whose situation requires it, make the experiment on any article of food subject to decay, and they will more than realize their expectations."

A Mr John Potter, whose communication may be found N. E. Farmer, vol. ii, p. 5, observes " I have for more than twenty years past kept meat hanging up in my smoke house, through the summer season, and no fly, worm, or bug has injur-

"To prevent such injury I take clear strong ley made of wood ashes. I commonly boil it to slender, for this will keep the scythe in a continumake it stronger than it generally runs off, then I take my bacon and smoked beef, having two or three gallons of the ley in a large iron kettle. take each piece of meat and dip it into the ley, so that it is completely wetted with it, then I let it dry-then I hang the meat in its former this circumstance. place. By this process I have invariably found that I kept the meat free from bugs and worms, and no taste of ley is ever perceived, not eveu on the outside."

A writer for the American Farmer, (see N. E. Farmer, vol. ii. p. 365,) says, "Last year not having a sufficiency of salt, I packed my hams and shoulders in dry oats, examined them once in the summer, and found they kept as well as when packed in salt. I have not seen a single skipper on bacon thus treated. It is a cheap and very practicable method, no expense attending it, the oats are not injured. It is very little trouble to unpack them, and it may be best to examine them

er they may get mouldy, but being very particular to see mine well separated by the oats, not one would have been injured if they had remained till fall without being drawn.".

Another mode which is practised by many, who supply Boston market, is to sew canvas, cotton, or some other cloth tightly about the ham; then give the cloth two or three coatings of lime white wash, which thoroughly protects the inclosed article.

MOWING.

They who have not been in their youth accustomed to do this work, are seldom found to be able to do it with ease or expedition. But when the art is ance learnt, it will not be lost.

As this is one of the most laborious parts of the husbandman's calling, and the more fatiguing as it must be performed in the hottest season of the year, every precaution ought to be used which tends to lighten the labor. To this it will conduce not a little, for the mower to rise very early, and be at his work before the rising of the sun.-He may easily perform half the usual day's work before nine in the morning. His work will not only be made easier by the coolness of the morncar. My mode of putting down any kinds of ing air, but also by the dew on the grass, which is cut the more easily for being wet. By this cover the bottom with charcoal, reduced to small means he may lie still and rest himself during all the hottest of the day, while others who begun late are sweating themselves excessively; and harting their health probably, by taking down large draughts of cold drink to slake their raging thirst. The other half of his work may be performed after three or four o'clock; and at night The use of charcoal properly prepared in hoxes, he will find himself free from fatigue.

If the mower would husband his strength to advantage, he should take care to have his seythe, and all the apparatus for mowing, in the best order. His scythe ought to be adapted to the surface on which he mows. If the surface be level and free from obstacles, the scythe may be long and almost straight; and he will perform his work with less labor, and greater expedition. But if the surface be uneven, cradley, or chequered with stones, or stumps of trees, his scythe must be short and crooked. Otherwise he will be obliged to leave much of the grass uncut, or use more labor in cutting it. A long and straight scythe will only cut off the tops of the grass in hollows.

A mower should not have a snead that is too al tremor, and do much to hinder its cutting. He must see that it keeps perfectly fast on the snead; for the least degree of looseness will oblige him to use the more violence at every stroke. worry themselves needlessly by not attending to

Mowing with a company ought to be avoided by those who are not very strong, or who are little used to the business, or who have not their tools in the best order. Young lads, who are ambitions to be thought good mowers, often find themselves much hurt by mowing in company.

Mowers should not follow too closely after each other: for this has been the occasion of fatal wounds. And when the dangerous tool is carried from place to place, it should be bound up with a rope of grass, or otherwise equally secured.

"Mr de Lisle introduced in England, the mowing of wheat. The method is this: the scythe he uses is at least six inches shorter in the blade than their position. When two pieces touch each oth- two twigs of osier put semi-circularwise into holes

made in the handle of the scythe, near the blade, in such a manner that one semi-circle intersects the other.

"By this method of mowing wheat, the standing corn is always at the left hand. The mower mows it inward, bearing the corn he cuts on his scythe, till it come to that which is standing, against which it gently leans. After every mower follows a gatherer, who being provided with a book or stick, about two feet long, gathers up the corn, makes it into a gavel, and lays it gently on the ground. This must be done with spirit, as another mower immediately follows."-Complete Farmer.

be right for our countrymen to learn this method of mowing their wheat; which will undoubtedly answer also for other sorts of grain .- Deane's N. E. Farmer.

THE BRATTLEBOROUGH PRESS.

This new power press has now been in constant operation for a considerable time, and the rapidity with which it throws off the work, while at the same time it executes it in the most beautiful manner, would seem incredible were "we not eve witnesses of its operation. It is the second one which has been constructed on the same plan. but it contains many important improvements, which render it now perhaps the most perfect machine of the kind in existence. The first one has been in operation nearly a year and has worked extremely well, but this one has not only surprised hut delighted us by the regularity as well as the rapidity of its motion.

It works two forms at a time, which are inked by the same apparatus, the impression being given by two platens, one at each end. Two girls are required to put on and lay off the sheets, which is all the labor required. The ordinary rate at which it runs is three tokens an hour, although on newspapers or other common work fifteen sheets a minute may be thrown off; indeed it has been run at the rate of eighteen a minute, though this is more sheets than can be handled for any length of time. In fact we see not how any more can be done on a press of any construction, for there is no delay in any part, the sheets may be put on as fast as they can be handled. If we mistake not the great Napier press cannot do much more than this does, with twice the number of hands.

The length of the machine is about eight feet, and the whole does not occupy many more square feet of room than the common press; the machinery which is exceedingly compact, is all contained between the ribs and the floor. The workmanship does great credit to the ingenious manufacturer, Mr E. H. Thomas, of this place. The price will be very moderate, and such as to bring it within the reach of nearly all who require one. The proprietors are now manufacturing them for sale, and any communications addressed to Messrs Holbrook & Fessenden, will meet with prompt attention. We earnestly recommend it to the notice of all who are interested in printing, as the most perfect machine of the kind of which we have ever heard .- Brattleborough, (Vt.) Messenger.

Locusts in Virginia .- The Staunton paper states, that myriads of Locusts now swarm through this neighborhood. The woods resound with their doleful cry.

FARMERS AND MERCHANTS.

In these times of depression and duliness, we know of no class of men who have so little to complain of as those who cultivate the earth.-We have heard it said occasionally that the farmers are in debt, that their produce does not find a ready and a profitable market, and that others have lands that are worn out and unproductive. and it is about as easy to state the cause. If lands are properly managed they cannot wear out .-Deep ploughing and liberal manuring will keep them forever productive.

In Boston market peas have not been sold for less than thirty-three cents the peck, and many As reaping is slow and laborious work, it would have been sold at seventy-five cents. The lowest of these prices is three hundred per cent, more than the cost. Lettuce sells at two and three cents the head, of very small size; radishes six cents the dozen; spinach, turnip tops, and beet tops, vegetables used for boiling, some of them pulled as mere cumberers of the ground, are sold for about their weight in cents. Turnips about the size of a nine-penny piece, twelve and a half cents the dozen. Can any one pretend that with ing read it, and observed "that wetting up Jonnysuch prices, the raising of vegetables is not a profitable business?

> We published in our paper recently an advertisement for a CLERK, "wanted in a wholesale store, who is willing to devote most of his time every day to writing, for a small salary," with the customary direction "apply at this office." the first day after the publication, seventy-eight persons applied, and on the second about half that number. Besides, we received two or three letters from distant places, the writers of which were anxious to obtain the clerkship.

> The reader may smile at the supposed incongruity of the facts that we have thrown together, and wonder what application we intend to make of them. It is no more than this: that when business is so dull in Boston that seventy or eighty able-hodied men apply in one day for a place where constant employment is demanded for a very small salary, and vegetables sell in the market for five hundred times the cost of production, it would be well for some of these persons to retire a few miles into the country and cultivate the earth. We would also impress on the minds of farmers, the folly of permitting their sons to come into Boston for the purpose of learning to measure muslin and molasses, to weigh teas and sugars, and to write puffs for the theatres and concerts, whilst they can employ them in raising peas and potatoes, which will yield more profit on a single summer's work than can be gained in a store in half a dozen.

There is, in truth, no condition of life so enviable as the farmer's. All the absolute necessaries of life he can produce directly by the labor of his hands, and most of the luxuries can be purchased with the produce of his farm. If we are met with the declaration that the lands are worn out and refuse to repay the husbandman for his toil, we deny the proposition. Massachusetts is capable of supporting three times, and probably ten times her present population. Land worn out and barren! It is all yet in its infancy, and requires only the hand of industry guided by intelligence, to enable it to yield its thirty, fifty, and even a hundred fold .- Boston Courier.

Saltpetre is said to be effectual in killing the wire worm.

Gooseberry Bushes .- A gentleman, who has for seven years protected his gooseberry bushes from the disease, or insect, which is so destructive to this fine fruit, informs us, that the disease (which he thinks is an insect) originates in a peculiar kind of moss, which is observable in spots on the stock and branches of the bush, and that whenever he finds it on them, he innediately cuts off the limb. He has left with us several pieces of the bush with the moss on them, in which he entertains no doubt the egg of the insect is deposited. Since he began cutting off these infected limbs, he has had abundance of fine gooseberries, which he could seldom obtain before. It would be well to try the experiment at least .- . Im. Farmer.

Brown Bread .- Some time ago, we published an account of a certain lady's method of making rye coffee, by keeping her rye moist and warm, till the saccharine fermentations had begun; which account has gone the rounds of the papers rather extensively, credited to the " Maine Farmer," &c. A writer in the Vermont Journal, havcake, over night, very much improved its sweetness," had some brown bread "wet up" over night, with less "emptins," (i. e. emptyings-subaudi, of the beer barrel,-we need not ask Dr Mitchell for the etymology,) than usual. The result of the experiment was much to the satisfaction of himself and family. We wish those concerned would think of it; for certainly no article of food in common use, so generally falls short of what it may be, and sometimes is, as brown bread. -Vermont Chronicle.

Foul and Musty Casks .- It is a fact that butter tubs, which have become foul by use, can be easily cleansed by filling them with any kind of meal or bran and water, and permit to stand till fermentation takes place-casks which have from any cause become filthy, may be cleansed in this way. And, ivasmuch as this mixture, after having performed this operation, becomes more suitable food for swine, than before, there is no expense attending it .- Vt. Journ.

Harvesting Grain .- Professor Schoen, of Germany, says, "every description of bread corn, when intended for seed, should attain complete maturity before it is reaped; but on the contrary when corn is to be converted into flour, it should be cut eight or nine days before it is fully ripe."-"Experience," says he, "has proved, that such grains as from maturity detach themselves from the ears, always produce the finest plants, from being larger, and more perfect in their conformation. The proper time for reaping corn, destined for the mill, is when the grains being pressed between the fingers yield to it, and become a viscous mass." In some parts of Bohemia, and Hungary, this practice has become a profound secret, because the flour so obtained was very much sought after, and always brought a higher price than the best flour from ripe corn.

Progress of Temperance .- A New York paper says, "we were told by one of our most respectable distillers, that his sales of rum for the last six weeks had not equalled the business of two days, a year ago." The general abstinence from the use of spirits will do much toward the restoration of better times.

From the American Sentinel.

BEES.

MR STARR-In a late number of the New England Farmer, information is requested respecting the sonrce whence the bees obtain the substance they bring to their hives, early in the spring, before any signs of vegetation appear.

It is, in general, obtained from the heads of the skunk cabbage, pothos gynandria polyandria, which is common in our swamps, or low springy ground. The blossoms appear in February and March, and abound with that material with which the bees are seen returning to their hives, at their first commencement of spring lahor.

Should "Medicus" become acquainted with any facts respecting these curious little animals, upon which he wants information, I shall be happy to furnish him with any in my power; having been, for more than thirty years, acquainted with the management of bees, and a careful observer of many facts relating to them.

Middletown, May 30, 1829.

The Season .- The present appearance of the grass crops in this vicinity is unusually promising, and it is now so far advanced that it may be considered out of danger from a drought. Indian corn came up remarkably well, and has grown so rapidly that it is now earlier than in the average of seasons at this time of the year. English grain of all kinds affords the promise of a bountiful harvest. The apple trees do not so generally bear as in some years, but those which have fruit on look well, and there will, probably, be no deficiency if the season should continue favorable. Of peaches there will be but few, and hardly any pears .-Cherries look tolerably well .- Mass. Spy.

From the Journal of a Naturalist.

Trees in full foliage have long been noted as great attractors of humidity, and a young wych elm in full leaf affords a good example of this supposed power; but in the winter of the year, when trees are perfectly denuded, this faculty of creating moisture about them is equally obvious, though not so profusely. A strongly marked instance of this was witnessed by me, when ascending a hill in the month of March. The weather had previously been very fine and dry, and the road in a dusty state; but a fog coming on, an ash tree hanging over the road was dripping with water so copiously that the road beneath was in a puddle, when the other parts continued dry, and manifested no appearance of humidity. leaves imbibe moisture by one set of vessels and discharge it by another, is well known; but these imbibings are never discharged in falling drops; the real mystery was, the fog in progress was impeded by the boughs of the tree, and gradually collected on the opposite side of them, until it hecame drops of water; whereas the surrounding country had only a mist flying over it. Thus, in fact, the tree was no attractor, but a condenser : the gate of a field will in the same manner run down with water on the one side, and be dry on cause. It is upon this principle that currents of air will be found under trees in summer, when lit- been known.—N. Y. Com. Adv. tle is perceived in open places; and the under leaves and sprays will be curled and scorched at times, when the parts above are uninjured. The large quantities in the United States, grow as well mencement. Inquiry and investigation will re-

against the foliage of the tree, it accordingly dethe bottom, where there are no branches or leaves to interrupt its progress. In winter there is little to impede the breeze in its course, and it passes through; consequently, at this season the air under a tree is scarcely more sensibly felt than in the spring of the year, the herbage under trees is nually .- Prince's Catalogue. generally more vivid and luxuriant than that which is beyond the spread of the branches; this may be occasioned, in some instances, by cattle having harbored there, and the ground becoming in consequence more manured; but it will be found likewise manifestly more verdant and flourishing where no such accessory could have enriched it, and is, I apprehend, in general chiefly owing to the effects of the driving fogs and mists, which cause a frequent drip beneath the tree, not experienced in other places, and thus in a manner kept up a perpetual irrigation and refreshment of the

Molasses .- It may be interesting to the public, and particularly to our brother Yankees, to know in what manner the price is made up which they pay for Cuba molasses. They will see from the following statement, that the cost of the article at half the amount required for casks to put it in.

Expenses of casks, per gallon,	7 cts.
Freight,	4
Duty,	10
Leakage,	$2\frac{1}{2}$
Small charges,	į.
Original cost,	3
	27 cts.

The value of Muscovado sugar in some of the West India Islands is from three to four cents per lb., and in others from four to five cents, according to the quality .- Jour. of Com.

North Carolina Gold Region .- This richest of all the American mineral regions, saving the coal district of the Middle States, and the Iron of New Jersey, and New York; is every day found to be more and more extensive. We on Saturday morning had a conversation with a gentleman who returned on Friday evening from a visit to the gold region, made at the instance of two gentlemen of this city, who are extensive landholders in the country. He has ascertained that at least 100,000 railway from Boston to Albany will cost more acres of the lands of those gentlemen are impreg-than the value of its advantages, is a question nated with gold, and has brought specimens of ore. The gentleman to whom we refer, visited one place where eighty men are employed in working a mine, and the product of their labor is about \$500 a day. While our informant was there, a number of crucibles were dug up, which were composed of soap stone, and must have been buried there for ages. It is therefore evident that the mines must at some remote period have been known to, and worked by, the Indians. Some gold rings, and articles of jewellery were found the country, and the advance of population, with in the possession of aborigines of that country, on the other; as will a stick, or post from the same the first settlement of the whites, but where the precious metal came from, has not until this time are yet unprepared for the undertaking, a genera-

air in its passage being stopped and condensed in our climate, as the common native hazlenuts, move obstacles, which prejudice, from the novelty

and produce very abundantly. Such being the scends along its surface or front, and escapes at case, it is hoped, ere long, sufficient will be produced from our own soils, to supersede the necessity of importation; as plantations of this tree would amply remunerate the possessor; or, if planted as a hedge, would be found to be very productive. A single bush of the Spanish filbert, the adjoining field. It may be observed, that in in Mr Prince's garden, produces half a bushel an-

> Superior and cheap Blacking for Leather .- Those illustrious professors of the black art, Messrs Day & Martin, Warren, Hunt, & Co., are now likely to be eclipsed by Mr Bracconnet, the eminent French chemist, who has discovered that a composition superior, as well as greatly cheaper, may be made from the following formula :---

> Take Plaster of Paris, passed through a fine silk sieve, 100 parts; lampblack, 25 parts; malt. 50 parts; olive oil, 5 parts. Let the malt be first macerated in water nearly boiling, to obtain its soluble particles. Then mix the plaster and lampblack in a basin with that liquid, and when evaporated to the consistence of paste, mix the olive oil with it. A little oil of lemons may be added to perfume it.

By the use of this receipt, the farmer may not only prepare a cheap and good blacking for his the places from which it is imported, is less than shoes, but also for the harness of his carriage or gig .- Register of Arts, London, vol. ii. p. 271.

> A farmer in West Springfield, last year let out his land at the halves, for the cultivation of hemp. He received more than forty-five dollars an acre, as his share of the profit !- Williamstown Advocate.

DEFERRED ARTICLES.

RAIL ROADS.

We have never seen a more able and lucid summary of arguments and facts in favor of that species of improved highways, denominated Rail Roads, than is contained in the following extract from Gov. Lincoln's last Message to the Legislature. If a good road has its advantages over a trackless space, rough from the mould of nature, the best of roads is still more desirable. If a smooth, hard, level, straight turnpike is to be preferred to a crooked, narrow, up and down, miry foot path, where a mule would stumble, and & goat must be on the look out for stepping stones, a railway fitted up with the modern improvements is superior to a turnpike. Whether the proposed without the sphere of our jurisdiction.

"That the great work of a rail road from Boston to the Hudson River, facilitating communication between the commercial capital of this State and the leading highway and thorough-fare from the immense regions of the North, and West to the commercial capital of the Union, is an event to be realized in the progress of time, no one who has the slightest acquaintance with the geography of the increased and multiplied occasions of business consequent upon it can reasonably doubt. The Legislator, who waits for more, will be in danger of Commonwealth so situate, that it will feel no discountry through which the route passes, now passing his life in fruidess indecision, and to the rect beneficial influence from the occupation of end of it, may see his country without progress in this new highway, neither is there a place which the sea board: while those of another section, not improvement. Besides, in public enterprises, the will be prejudiced, in its essential interests, by its less important, have opened to them an advantaprofitable investment of capital is not the only mo-construction. To the City of Boston, indeed, it is geous avenue to trade, through a work of art, retive to action. Indirect, consequential, and wide- believed to be of vital concern. But the streams cently executed by the almost unassisted enterly diffused benefits, are oftentimes more weighty of business, which it will pour into the metropolis, prise of the citizens of a neighboring State. The will be returned to the remotest parts of the Commonwealth, in the diffusion of the treasures which ments and arguments which should prevail with trade and commerce produce, or in a relief from the accommodation of rail roads, nor will the the burdens elsewhere, to which accumulated wealth Representatives from those districts justly incur posed undertakings. If there is anything sound will be subjected. If the city be disproportionably suspicion, if they should be found to advocate enriched, precisely in the ratio of this advance, their construction. The object is of general conwill be her liabilities to the contributions of the cern. The promotion of the great interests of can avail anything, they teach the importance of State, and a corresponding reduction in the taxes the commonwealth,—the extension of domestic facilitating intercourse, reducing the cost of trans- of other portions of the country. On the other trade,—the saving of that tax on labor which now portation, saving manual labor, opening new avrested, her trade to decline, her population to re- leaves agricultural produce to perish on the land, Profitless, indeed, useless, and worse than useless, move, her capital to be transferred to other cities, from the expense of getting it to a market, and ment to the contemplated works of improvement. Without this patronage, exercised to some extent in advancements towards expense, it is much to be feared they cannot be undertaken, or if undertaken, that it must be grants of privilege and power repuguant to the sentiments of the people, inconsistent with the genius of a free government, and impairing the control and future enjoyment, by the community, of the capacities of the country for other purposes, and possibly, still higher objects. Let the subject, then, be viewed carefully, patiently, and without excitement, and if upon faithful investigation it shall be found entitled to favor, let that measure of encouragement and support be accorded to the work, which shall secure its effectual and most advantageous accomplishment.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JUNE 19, 1829.

ERRATA.

In some of the copies of the last number of our paper, the following errors in the valuable article on the "Circulation of Sap in Trees, &c.," were suffered to pass without correction.

Page 370, 1st column, line 20 from the top, after "others," insert a period, and commence the word "this" with a capital letter.

Line 22, in the same column, for "preceded," read succeeded, and for "summer," read sunny.

Line 19 from bottom in the same column, for " heads," read buds.

INDIAN CORN.

Judge Peters, formerly President of the Pennsylvania Agricultural Society, recommended the harrow instead of the plough in cultivating Indian corn; and perhaps in weeding, or the first time of hoeing, the harrow will be found preferable to the plough, especially in a light, mellow soil. In a stiff, or stony soil a plough or cultivator is to be preferred, at least for the second and third time of hoeing. The plough, or cultivator leave more of the land light, and in a situation to be easily disposed of by the hoe, and are less impeded by stones, roots, and other obstacles, than the harrow. It will, therefore, be best to be governed by circumstances, but, perhaps, as a general rule, harrowing for the first time of hoeing, and ploughing at half hilling, and hilling, will prove the most advantageous mode of cultivation. After your corn is hoed for the first time, it will be a great advantage to place about each hill a handful of ashes, or gypsum; or some say a mixture of both will prove more advantageous than either used sepa-

HONOR TO WHOM HONOR IS DUE.

An excellent essay, well calculated to benefit the community, entitled "Hints to People of Moderate Fortune," originally published in the Massachusetts Journal, was reprinted in our paper, page 368. We do not recollect how we came by the article, but have seen it circulating in several newspapers as an estray, without marks of ownerquantity of sun beams, whose transit had been over and about our neighbor's premises.

these are motives for the patronage of the govern- should be proud of the ownership of such a chattel, but a regard to justice compels us to indicate its true proprietor. We understand that it was written by Mrs Child, lady of the Proprietor and Editor of the Massachusetts Journal.

FOR THE NEW ENGLAND FARMER.

PEACH TREES.

Ma Fessenden-I notice a very intelligent horticulturist states in a late paper of yours, that during the past cold season "the peach tree has suffered severely from Massachusetts to New Jersey.". I am aware that this tree has so suffered in Massachusetts, and have heard of the instance refer- layer of the Jersey grape vine in my yard, of red to in New Jersey, but I can assure you that on Long Island, which is between the two points named, not a single tree has suffered in the least; indeed I have not seen a blossom bud that has been injured. And the peach, nectarine, and apriicot trees are now loaded, and even in many cases overcharged with fruit. The orchard referred to in New Jersey, and which is said to have been injured, (but about which I have heard contradictory statements,) lies near the sea coast, and is exposed to the severe storms and gales which rage on the border of the ocean. HORTUS.

FOR THE NEW ENGLAND FARMER.

CULTURE OF SILK IN MAINE.

MR FESSENDEN-I take the liberty to propose the following queries respecting silk worms, and trust that some one of your correspondents will furnish a solution to existing doubts. Our northern location in the State of Maine has served to create doubts as to the success of cultivating silk. and it is with the view of having the truth generally known, that these questions are submitted for consideration.

- 1. Should not we in the State of Maine labor under material disadvantages in the culture of silk. provided our seasons are not sufficiently long to feed and bring to maturity two sets of silk worms in succession, as can probably be done in Connec-
- 2. In consequence of our seasons being shorter than those further south, have our mulberry trees a less quantity of leaves on them? If not, then might not the objection "that the culture of silk in Maine cannot be advantageously pursued, hecause our seasons are not long enough to raise two crops of silk worms in succession," be obviated, by raising, at once what (under different circumstances) would have been raised in two crops? BRUNSWICK.

Oil of Maize, or Indian Corn .- Extract of a letter from N. M. Wells, Esq., of Detroit, Michigan, to Samuel L. Mitchell, dated May 16, 1829 .- N. Y. Farmer.

DEAR SIR-I send you a small phial of with a peculiar brilliancy. Those physicians who the ground, which is only 7 1-4 inches. newspapers as an estray, without marks of owner-have given it to their patients, say it is as effect-ship. We therefore appropriated it to our reader's ual and as mild as castor oil. The oil is separathehoof, with no more idea of claiming it as ours ed or made to rise on the tub by a process discovby virtue of authorship, or trespassing on the ered by accident, and is a secret which the indiproperty of others, than if we had made use of a vidual who made the discovery will not disclose. When the mash is made in the common way, no When the mash is made in the common way, no | † For the table about 440 bunches a day for thirty days from We | oil is separated; nor is so much spirit by some one vine!...Ed. Am. Far.

quarts to the bushel obtained. You would confer a favor by conveying to the individual, through me, some way to purify it, and cleanse it from the taste of the corn, and the smell of the beer. Any information will be most thankfully received and communicated to the individual concerned.

From the American Farmer.

Remarkable Grape Vine, reared by that skilful Horticulturist, John Willis, Esq., Collector of the Port of Oxford.

On the 25th of March, 1822, I planted a small which, I intended to make an arbor, and produce delicious table fruit, as I had found the fruit fine, hangs long, and very desirable-the place is somewhat encumbered with about half a dozen valuable fruit trees, and the first two years the vine made very little growth; neither was there much notice taken of it; the third year it made a surprising growth, and took the attention of many strangers. I then tried the best skill I was master of to force and encourage the growth. The fourth year it so far excelled my most sanguine expectations, and began to smother a fine hearing pear tree, and appeared to threaten some more trees, that I pruned off of the south and east side of it about one hundred and sixty cuttings; and found it, in the fifth year to extend (where not close pruned,) each way, about thirty-five feet or more; and last spring, it was so laden with fruit, that I was going to have the bunches counted, (as it is the bunch grape,) and they are of tolerable good size; but we were visited by several hail gusts, which destroyed so many of them that I declined having the balance counted. Now it is again well laden with fruit; and I have, this day, invited some of my neighbors together to come and count them, which could not be done, only, I have drawn lines through the vine in fourteen places, so that they may count between them-all double bunches are only counted as single ones; and you have their certificate at the bottom; and if you please, you may give it a place in your most valuable work. Now the grapes are out of all danger, (except hail gusts, &c.) Those gentlemen know the planting and management of this vine. I only call it five year's growth though planted seven. Now, how much do you suppose the Great Hampton Court Palace vine, planted in the reign of king William,* could have excelled this, at five years' growth?
To J. S. SKINNER, Esq. JOHN WILLIS.

Oxford, May 23, 1829.

We the subscribers do hereby certify that we have this day counted the bunches of grapes on Mr J. Willis's splendid vine, and find the number to be 13,315,† amongst which we suppose near half to be double, although counted as single .--We further state that we have known said vine oil of Indian Corn. It was obtained from the nearly from its planting, and can affirm the statemash when fermented for distillation. From four ment of Mr Willis to be correct in every respect. bushels two quarts have been obtained. It burns We also took the circumference of the vine near

THOMAS WATTS, RICHARD MARKLAND, JAMES STEWART, Jr.

^{*} See Cobbett on Forsyth, page 79.

A New Destroyer .- The myriads of pigeons which have lately visited this country are almost as destructive to the farmer's prospects, as the swarms of locusts in ancient days to the ill fated husbandmen of Egypt. They seem to make clean work where they alight upon the corn fields, and farmers in this and the neighboring towns are said to have had 6, 8, 12 and 15 acres of the voung corn pulled up by these mischievous birds. Multitudes are shot and taken in nets; but a farmer in Fairfield has adopted a new way to " come Paddy over" then: he soaks his corn in whiskey, and scatters it about the fields-the pigeons soon become intoxicated, and are thus caught easily by hand! A solution of arsenic is reported to have been sometimes used-but this is an improper and dangerous experiment .- Little Falls Friend.

From the New York Farmer.

New Material for Cordage .- Mr Perrine, Consul of our United States at Campeachy, forwarded to Dr Mitchell, a short time since, a very strong and excellent material for the manufacture of ropes and lines. It has very much the appearance, when dressed and prepared, of the article from the Philippine Islands, called Manilla Hemp. In order to make the communication more interesting, this gentleman sent along a box of earth, containing several fresh plants of the species, for cultivation and botanical research. It is to be regretted, however, that they were, every one, killed' by the frost which the ship encountered, on approaching the port of New York. Together with these, arrived three full grown plants that had been grubbed up as dead samples, for experiments. These were distributed to proper individuals, for improvement. The filamentous, or fibrous matter is obtained from the long and bulky leaves by maceration, or soaking in water; and sold, when clean and dry, for two hundred and fifty dollars the top. I.

ED. N. Y. FARMER.

Shortening Life in England .- A report of considerable interest has been recently made to Parliament, respecting the " Law of Mortality of the Government Life Annuitants," from which it appears that the duration of human life is shorter than it was fifty or one hundred years since, notwithstanding the introduction of the kine pox, and the advancement of medical science. It is also ascertained that the life of woman is longer than that of man. The latter fact is accounted for by the circumstance that women do not eat and drink to excess, as men do; and they are not compelled to encounter such hardships, nor are they so much exposed to accidents. The shortening of life on the aggregate, in Great Britain, is accounted for by the fact, that "in high life people are more luxurious and idle, and death carries them off faster than formerly, and in low life people have not so much to eat and to drink, nor are they so well clothed, or warmed by fire, and bed clothing at night."

· Large Dandelion .- There is now growing in the garden of Capt. Samuel Hunt, in Northfield, a Dandelion from one root, containing four hundred and eighty-two leaves, and one hundred and fortyseven stems; eight of which are three times larger than those of common growth. It occupies a circle of six feet circumference.-Centinel.

Mr E. J. Coale's Mncmonica, under the article of Man, contains the following useful hint " Married women live longer than maids." A hint, perhaps, as useful to the other sex, may be found in a late number of the North American Review, in an article on the "art of being happy." The reviewer concludes his remarks by observing that "the mest judicious philosophers have laid it down as a fundamental principle, that a man is never happy without a good wife."

Tea Trade between Canton and Ohio !- One of the Cincinnati papers mentions, that large quantities of teas, of the best quality, are to be seen, marked and shipped in Canton, for merchants in Cincinnati!

As an instance of traffic between Ireland and Glasgow, in the article of eggs, it may be mentioned that one of the Derry steam vessels, in a late trip, brought over fifteen tons, and on her next voyage upwards of twenty tons of eggs-270,000 ordinary sized hen eggs.

John Thew has been fined \$75, at Newburgh. N. Y. for refusing to marry, according to promise, a widow with six children. Perhaps the money was well laid out.

The Worcester Spy states, that "Indian corn came up remarkably well, and has grown so rapidly that it is now earlier than in the average of seasons at this time of the year. . English grain of all kinds affords the promise of a bountiful har-

Locusts.-The St Clairville Gazette announces the arrival of these insects, in vast numbers, in Ohio. They amuse, or rather annoy, the people, from day to day, with their accustomed music .-It is feared they will do great damage to the fruit

Multitudes of Locusts have made their appearance in the neighborhood of Washington, Pennsyl-

Sir ISAAC COFFIN, M. P., is now on a visit to Boston, he resides with Jonathan Amery, Esq., Sumner st. Mount Vernon.

It is said the new Pope, among other items of "reform," intends to abolish the celibacy of the clergy. This will be a very popular measure with the Roman Catholic ladies.

The London Lancet, a medical work, mentions that Doct. Dodd has advanced an idea that tanpers are not liable to die of consumption, or phthisis pulmonalis. It may be the case; but we believe that a good many look at death through the medium of rheumatism.

English Scythes.

James Cam's double prime grass scythes, wide and narrow, a superior article, for sale at the Hardware Store of S. FES-SENDEN, No. 80 State Street. 8t June 19

Heifers, Calves, Sheep, &c.

Hetjers, Calves, Sheep, Syc.

For sale, two full blood Alderney Heiters, three years old this spring, with ealf by a full blood hull of the Short Hora hreed; one Alderney Heiter ealf; six months old, weaned, and turned to grass; two full blood heifer calves of the Short Hora breed, two months old, now at grassfeed; four of the Long Wool Ewes, imported from the Netherlands; a buck lamb from one of the ewes, and a Devonshire Buck, a very fine animal, and four full blood Saxooy Bucks. For terms apply at this office. June 17, 1829. June 17, 1829.

Seed Potatoes.

For sale, at No. 26 Foster's wharf, 200 bushels of superior Nova Scotia Potatoes. A fine opportunity is here offered to farmers, who wish to improve the quality of their seed potajune 5

Millet Seed.

For sale at the Seed Store connected with the New England

For sale at the Seed Store connected with the New England Farmer, No. 28 North Market street.

50 bushels of Millet Seed,—clean, and of superior quality.

Also, a very extensive variety of Ornamental Flower Seeds, in papers of 6 cts each, or 100 varieties, one paper each, for \$5,00.

ROMAN-This elegant, full blooded horse, a bright bay, with black legs, mane, and tail, of high spirit and good temper, will stand at the form of Mr Stephen Williams, in Northborough, Ms, at \$20 the season, to be paid before the mares are taken away.—See New Eagland Farmer, May 15.

Red and White Clover Seed.

For sale at the New England Farmer Seed Store, No. 52 North Market Street,
500 lbs. Dutch White Honeysuckle Clover, (imported.)

Also, Herd's Grass, Red Top, Orchard Grass, Lucerne, Foul Meadow, Hemp and Flax Seed, &c. &c. March 27

FARM for sale in Milton, of about 200 acres, remarkably well watered, with every variety of lands and fruits, good substanwatered, with every variety of lands and fruits, good substantial buildings, and a large portion of valuable woodsland—Also, for sale, or to let, opposite to the above named premuses, a large dwelling house, with a good bake house, very pleasantly situated.—For further particulars, see the New England Farmer for May 15, or inquire of the poblisher, or P. H. Pierce, 33 State st, or N. Tocker, on the premises.

May 22, 1629. tr

Imported Horses.

Barefoot, and Cleveland, the two Eoglish horses, will stand for the season at their stable in Brighton. Barefoot at \$25, and Cleveland at \$10, with \$1 for the groom. a24

JUNE.

BY T. G. FESSENDEN.

Though rhymesters pourtray The pleasures of May In verse, which is nothing but gingling, June only can bring Us the beanties of Spring Without its deformities mingling.

Madam May has her blights, And her vile frosty nights, The hopes of the husbandman blasting; And her north eastern blows, Which one would suppose Were cut out to be everlasting.

But, June for my Muse, With her sweets and her hues. Fit topics for lovers to talk on; While Flora around Spreads over the ground Fine carpets for farmers to walk on.

If June could hold out The whole year about, Such pleasure sans measure be giving, This lower world would . Be a mansion too good For poor wicked mortals to live in.

In looking over some old manuscripts which formerly be-longed to our grandfather, we stumbled on the following pieces of continental poetry. -Bultimore Emerald.

> Come ont, ye Continentalers! We're going for to go To fight the red coat enemy, Who 're plagny " cute," you know.

Now, shoulder whoop !-eyes right and dress-Front! Davis, wipe your nose: Port whoop; that's sleek-now, carry whoop! Mike Jones, turn out your toes.

Charge bag'net !- that 's your sort, my boys, Now, quick time-march! that's right; Just so we'd poke the enemy, If they were but in sight.

Halt !- shoulder whoop !- stop laughing, Nick, By platoons-wheel-halt-dress! Hold up your muzzles on the left. No talking more nor less.

Bill Sneezer, keep your canteen down. We're going for to travel; " Captain-I wants to halt a bit, My shoe is full of gravel."

Ho---strike up, music---for'ard march! Now point your toes, Bob Rogers; See---yonder are the red coat mea---Let fly upon 'em sogers !

Uncultivated Minds .- Sir William Hamilton, in his account of an eruption of Mount Vesuvius. gives a curious picture of the excessive ignorance and stupidity of some nuns in a convent at Terre del Greco:-one of these nuns was found warming herself at the red hot lava, which had rolled up to the window of her cell. It was with the greatest difficulty that those scarce rational beings could be made to comprehend the nature of their danger; and when at last they were prevailed upon to quit the convent, and were advised to carry with them whatever they thought most valuable, they loaded themselves with sweetmeats.

Management of Infants .- The habits of a nurse maid have an undisputed effect on the health of an infant, and in various ways, may be detrimental to future happiness. Indeed both physical and moral education may be said to commence with the first breath of life.

The habits that an infant's life calls immediately into action from its nurse, are thoughtfulness, and cleanliness. A nurse maid without the former, will not think sufficiently of the comfort of her life. charge: she will hear it cry, without endeavoring to know the cause, in order to administer relief. It may be suffering pain from bandages and strings too tightly drawn, while its apparent uneasiness, if not unheeded, is attempted to be hilled away, rather than the cause removed. It may be subject by a careless exposure to a draught of air. or from the effects of too glaring a light, to inflammation of the eyes, the foundation of future diseases, which may hereafter impair the vision, if not destroy it altogether. Sight, being the most delicate of our senses, and, I think, the most valuable also, cannot be too carefully guarded. The hearing also may be sacrificed to carelessness .-Leaving the head damp after washing, and exposure to cold winds, with the ears not well covered, frequently causes the ear ache, and temporary deafness, which may be the origin of that disposition to permanent deafness, which frequently shows itself, and saddens the latter period of life. What may be the effects of such misfortunes on the character and disposition of individuals thus afflicted, it is not possible for me to say; but generally they are such as affectionate parents would earnestly wish to avert from their offspring. From the want of cleanliness of a nurse, the health of a child may be greatly affected. If the skin be not well washed the pores will become clogged, and othy, Orchard Crass, Oat Grass, Herds Grass, &c. the insensible perspiration impeded, by which the Agricultural Books. the insensible perspiration impeded, by which the whole system will become deranged; and this is one cause of the squalid appearance which some children present. Besides this inconvenience, that want of cleanliness and order, which is often betrayed at other seasons of life, may be attributable to such defects having prevailed in the nursery, in which, I believe, that not only our bodies are cradled and nursed, but also the virtues and vices of our minds.

As the life of the infant proceeds, the activity of the nurse is another habit of importance to it. As soon as its strength will permit, it should be in gentle motion almost the whole of the day, except the intervals necessary for its sleep and nourishment. A child of four months old should begin to spring in its nurse's arms; to exult at objects which attract its attention, and to grasp, though with imperfect vision, at the things beyond its reach. But how often have I seen the reverse! and have wished to have taken from the dull and indifferent nurse, the little being that has hung heavily upon her arms, while it looked around it with vacant stupidity, and whined half the day away, merely because its attention was not roused, nor that natural gratification afforded to it, which children derive from the unfolding and exercise of the perceptive faculties. A very sensible nurse maid, whom I once met with accustomed herself, whenever she saw the little boy, of whom she had the carc, looking steadfastly at any object, to suffer him to examine it well in every direction, and to permit him, when possible, to handle it. She would also call his attention to almost every object which, presented itself in their most every object which, presented itself in their large and a divace.

Published every Friday, at \$3 per annum, payable at the dof the year—but those who sput within \$1 per she for the year of the year o herself, whenever she saw the little boy, of whom

walks, even from the stately ox to the spider hidden from its unwary prey. This child was afterwards remarkable for his accurate observation, and for the power of fixing his attention when required, upon his various studies. I have no doubt he was indebted to his nurse for the early devel-opement of these powers, which proved most ad-vantageous to him in acquiring knowledge, and in making just observations in his progress through

Stone and Aqueduct Pive.

A further supply of this very useful and uccessary article for drain and water courses, which is superior and cheaper than anything used for the purpose, is for sale at the Agricultural Warehouse, No. 52 North Market street, where orders are reand circular pieces to match.

FRENCH PLANTS.

will be recollected, came over from France, this will deteriorate in America. spring, with a most unique and unrivalled collection of plants,* it is highly desirable that a description of the plants, as they flower, may be cominunicated to you for publication in your valuable A SUBSCRIBER. paper.

FOR THE NEW ENGLAND FARMER.

SLinnwan Botanic Garden, near New York, June 20, 1829.

MR EDITOR-Both you and our esteemed friend Mr Downer, having heen desirous to obtain information relative to the origin and properties of the "Bleecker's Meadow pear," I transmit you the following account of it. This pear was originally procured from the farm of Colonel WYNKOOP, of Bucks County, Pennsylvania, being a seedling found in his meadow, and from that circumstance was called by him "Meadow pear." brought thence by a relative of his, Mr MARTIN SCHENK, of this Island, and grafts were disseminated from the trees planted on his farm. Several gentlemen now have this pear in bearing, and two large ones are growing on a farm not far distant from my residence. LEONARD BLEECKER, Esq., a gentleman distinguished for his love of horticulture, and for his liberality in imparting any valuable varieties of fruit to others, presented grafts of this pear to several of his friends, and it was by them called " Bleecker's Meadow pear" -so much for its origin. In regard to growth the tree has much resemblance to the Seckel, and its bark and general appearance when young, so closely assimilate as not to be easily distinguished. Its growth, however, is much more vigorous, making at least three feet of wood to two of the Seckel, and often more. I am also informed, however, by Mr Bleecker, that the tree when it becomes large, does not assume that compact and erect regular form in its head that so distinguishes the Seckel, but that the branches are more expanded, and much less erect. One tree in a garden near Newburgh, bore fruit the fourth year from the graft-the fruit does not hang in clusters as the Seckel does, but its period of ripening is the same -its flavor is delicious, and it is a melting fruitit should, however, be plucked before it softens, and be placed in the house to mature and become mellow-in point of size it is larger than the Seckel, and in form resembles the Early Sugar pear, (not the Sugar Top, or July pear, which some call Sugar pear)-before it softens it is green with a little brown or russet on the sun side. I am fully of opinion that the Seckel is one of the parents of this new pear, and as I consider it a very valuable addition to our native fruits, I have been thus particular in the details, and cannot omit here the passing remark, that in proportion to the

experiments made in our country, in rearing seed- confined he should then derive a benefit from his ling trees from the finest fruits, after an intermixture of the pollen, or otherwise, they have been attended with far more than a comparative success with those made in Europe-and every new MR Russell .- As some of your subscribers levelopement of our horticultural improvements have probably made great additions to their plants; seems to add new proofs to the opinion I have alby purchases from Messrs Felix & Co., who, it ways entertained, that none of her productions

Your obedient servant, WM ROBERT PRINCE.

POTATOES.

People differ more about planting potatoes, than anything that I know of; for it good land is well prepared and manured, it is not difficult to raise few or many.

I have known people to plant from 1 bushel to 40, on an acre of land-and each was satisfied that their plan was best.

One man who had not more potatoes than he wanted to eat, cut out the chits and planted those only, one bushel of which planted an acre, saving the body of the potatoes for ordinary uses: his land being well prepared, the produce was more t'an 100 bushels.

Another man who had practised farming until he was 21 years of age, and then went to college, and became a great man, having seen that potatoes would produce most when planted whole, (contrary to his ideas in younger life,) he thought proper to try what he could do. He prepared an acre of excellent land, by ploughing it thoroughly, and manuring it highly, then ridged it by turning two furrows together, to cover the manure, then planted it with large whole potatoes, within one foot of each other, in continued rows on the ridges, which he did not cross with the plough, in hoeing, and it took 40 bushels to plant his acre. the cost of which was 50 cents per bushel, amounting to \$20 for his seed. He had a large crop of potatoes, but not so large as he would have had by planting 20 bushels in the same manner, with potatoes not more than half as large; or by placing the same potatoes two feet able gentleman in this vicinity, informs us that for apart; or by placing them two feet apart, and half as large, making only ten bushels to the acre.

acre, according to the size of the potatoes used for the purpose.

When people try experiments, I think it is best to do it fairly, and to use their reason. And it is a good method to try different modes, and not be so much in favor of any old practice, as to put a stone in one end of a bag of grain to carry on a horse to mill, or to cut potatoes, because your father did; though very many might amend, by of being without it, than he thinks of getting doing as their fathers did, especially in eating along without bread. We hope others of our and drinking.

AN OLD FARMER. readers will try it, and have no doubt but they and drinking.

HEALTH.

of his time in laying plans to break out of prison, ders for which ardent spirits are an effectual cure. calculating that if he should ever happen to be

present labors. One day his father saw him at work, and being informed of the object he had in view, told him he thought it would be a much more profitable business to study to keep out than to break out after he had once got in. This was good advice, and is worthy of being followed. inasmuch as it may, with a slight alteration, be made to apply to numerous other situations in life than that of prisoners. This is particularly the case in regard to the preservation of health. It is much easier, as well as more profitable to avoid exposure to evening air and Wet feet than to be confined five or six weeks with a burning fever. It is also much easier to caution children against eating green apples and other kinds of trash, which are within their reach at this season of the year, than it is to cure them of the dysentery .good crop, in a common season, even if you It has been said, and we doubt not truly, that plant them whole or cut them, whether you plant more than half of the diseases which prevail in our climate in the warm season, might be prevented even by ordinary care. Among the means to be employed to preserve health, the habit, or if we may so say, the virtue of cleanliness demands the highest place; and to a want of it may be traced many of the ills to which 'flesh is beir.'-In all the melancholy instances where sickness has visited our Atlantic cities in the course of the last twelve years, we have good authority for saying that the contagion originated in such parts of those cities at are notorious for the fifth of the streets, and their inhabitants. In the country, where dwellings are unconnected, and where a pure air circulates freely, we are less liable to suffering from the carelessness of our neighbors than residents of more compact places, but the safety of every family in an eminent degree depends on the care and cleanliness of its head. All decayed animal and vegetable substances should be removed from the vicinity of dwellings; stagnant water should be drained off, and the cellars freed from rotten apples, potntoes, onions, &c.

Another very important means of preserving health where it is enjoyed, and restoring it where it is wanting, is, to sprinkle quick lime on the hottom of the cellars, and in all the drains and vaults contiguous to houses. So effectual is this safeguard in preventing disease, that a highly respectseveral years after he commenced house-keeping some one or more of his family had a regular run I sometimes plant from S to 16 bushels to the of fever; after a time he built a house, and consequently a quantity of lime was lying in and around bis residence, but no sickness visited his family. In three of the six subsequent years he had occasion to use lime, and in each of those years his family enjoyed perfect health, while in the other three some of the family were sick. He is so well convinced, from these circumstances that lime is beneficial, that he now no more thinks will feel themselves amply repaid for their expense and trouble. Indeed, we will warrant it to We once knew a boy who spent a great part be an effectual preventive against all those disor-

FINE STOCK.

MR FESSENDEN-Having seen in your "N. E. Farmer," within a short time, several notices of extraordinary calves, induces me also to add to the

A very fine cow, now eight years old, of my own raising, half Holderness and half Alderney, has produced me, by different bulls, seven calves; they have all been very fine ones, and all are at this time alive; four of them are in my own possession. Her last calf was born 4th of last December, (a bull) and at 4 days old weighed 110 lbs., being early, and a winter calf, I had not intended to raise it-but it was so uncommonly promising, I was induced to do it. On the 4th of March at 90 days old, it weighed 339 lbs .-After that date one half of the cow's milk was ish with hunger were the drones preserved, but taken from it-he having learned to eat carrots, there probably is a time when the males make oil meal, and hay-and on the 16th of April I sold him to an enterprising young farmer, at as tends to irritate them, and prompt to their des-Rindge, in New Hampshire, for fifty-five dollars. He was then 4 months and 12 days old, and weighed 455 lbs., giving an increase of 2 lbs. 934 from the root of the horns to the end of the rump table, and placed himself and an assistant be-His sire was three-fourths Durham Short Horn, ally massacred the males in the whole six hives, and one-fourth Bakewell. This young bull is the beef and dairy qualities.

largest cow I ever raised. To be sure she has always been well kept, (but not highly fed) as all animals ought to be. I should not wish, however, to have a heifer with her first calf, come in before a good bite of grass.

Yours very truly. JOHN PRINCE.

Jamaica Plain, June 29, 1829.

FOR THE NEW ENGLAND FARMER.

CRUEL CUSTOM OF BEES.

MR FESSENDEN-I wish that you or some of your correspondents would inform me through the medium of your paper, what is the reason of bees killing their drones at this season of the year; and how they may be united, to prevent, if necessary, their killing them; and if it will hinder or retard their swarming? I have a number of full stocked bives, which appear to have such aversion for their drones, that not one, I believe, is suffered to live in the hive. If some of your experienced apiarian writers will give me some light on the subject, I will be much obliged to them.

Yours, &c., A FARMER.

is a habit which appertains to all the species of honey bee. We shall not undertake to state the cause of this proceeding. Whether bees justify themselves by arguments similar to those made use of by certain advocates for killing off' the human species in martial combat, is more than we can say, having never been admitted to their counsels. Probably they conceive it to be the shortest way of getting rid of their useless population. The fact, however, is certain, and the rest. slaughter always takes place.

Dr Thacher says "It has been ascertained, that after a particular period of the year, when the queen has been impregnated, and the drones are no longer of use, they are cruelly destroyed by those very workers which formerly watched over them so carefully in their cradles. It is not to be supposed that the nenters know they would persuch an impression on the senses of the neuters truction. It is usually in the months of July and fruits. The apricot does not bear at all. The August, that this singular massacre is effected .-A curious observer, Huber, desirous of witnessing tenants of the orchard, although well loaded in the ounces per day. On that day he also measured the scene of carnage, placed six hives on a glass 5 ft 8 in.; girth 4 ft 4 in., and height 3 ft 8 in. neath it. On the 4th of July, the workers actuat the same hour and with the same peculiarities. therefore three-eighths Short Horn, two-eighths The glass table was covered with bees, full of an-Alderney, two-eighths Holderness, and one-eighth imation, which flew on the drones, seized them Bakewell, and comprises the best blood of Eng- by the antennæ, the wings, and limbs, and after lish stock. PREVENTIVE SOCIETIES.

Ma Editor-At the last meeting of the Massachusetts Horticultural Society, I was much gratified to hear the remarks of Mr DERBY, of Salem, on the ntility of the Society in that town to preserve gardens and orchards from trespassers, and midnight maranders. He stated that but one instance had occurred since the establishment of the Society, of a garden or orchard (belonging to a member) being robbed; and that the evil had almost entirely ceased. I understand that Dorchester, Roxbury, and Quincy have followed the example of Salem; and every town where fruit is extensively cultivated, would find it for their interest to establish similar societies; and all roaming intruders would soon find that trampling on plants, breaking down trees, and shrubbery, &c., cannot be tolerated with less impunity than shoplifting, or store breaking.

Nashua Cotton Manufactory .- At the factories

AGRICULTURAL PROSPECTS.

The expectations of abundant crops, founded on the fine weather of spring, have been much diminished by the long centinned drought. The hay harvest of the present year will be less than that of the last by nearly a third. The extraordinary production of two successive favorable seasons seem to have exhausted the soil, which requires renovation by an interval of comparative

Oats, barley, and rye, are well filled, and the crops of those grains will be good.

Corn in our vicinity has suffered much from the operations of the cut worm, as it is called, who gnaws off the stalk at the surface of the ground. Some fields have been destroyed by the enemy, and the owners been compelled to plant potatoes. The only preventive seems to be to search the hills with the hoe or hand and crush the vernin-a process troublesome and slow, but better than suffering the loss of our staple products,

The apple, peach, and pear, will yield very few cherry which has been less injured than the other early spring, has suffered from a blight, which has made the fruit fall nnripened to the ground .--Nat. Ægis.

From the Southern Agriculturist.

ON THE WINTER BEAN.

We call the attention of agriculturists in the northern, as well as in our own States, to the Winter Bean. It is thus mentioned by Chateauvieux, in his letters from Italy, and we presume is the same as that described in English works, under the name of the "Swiss Bean."

"The winter beans seem the only crop meriting particular notice. Within a few years they have been successfully introduced into the neighborhood of Geneva; that is to say, into a climate where the winters are more severe. The beans endure them without injury, and may be introduced into the northern countries, where they may become a valuable article in agriculture; being well adapted to fill up vacant spots in various crons.

"The winter bean resembles the spring bean, in plant, flower, and seed. It is sown in the beginning of September, and it must acquire strength in the autumn to support the severity of the wigter. The stem withers and dies under the snow, and during frost; but early in the spring, several new stems shoot from the bottom, which flower in May, and the seeds ripen in July.

"The culture is very simple; after a manured crop of wheat, the earth is turned in by a single ploughing, and moulders by exposure to the weather. The beans are put into the ground early in September, either sown broadcast, and harrowed, ploughed in, or drilled in lines, which admits of their being horse-hoed in the spring, etherwise they must be hand-hoed in April.

"The crop being harvested in July, there is time to prepare the land for wheat, which follows it, and usually succeeds well.

"This culture, adapted to open and clayey soils unfavorable to the growth of roots, accords well with the different periods of ploughing and sowat Nashua within the last twelve months, 2,240,- ing, and keeps up the fertility of the soil. It in-000 yards of cloth have been manufactured, con-cludes every desirable circumstance, and I have sisting of sheetings and shirtings, a part of which no doubt will extend rapidly."-Chateauvieux, p. 49.

Remarks by the Editor .- This annual massacre were for printing.

"THE WINTER, OR SWISS BEAN.

We are desired to call the attention of our readers to the merits of this lately acquired variety of horse bean, which promises to be a valuable acquisition to the British farmer. It is an early and remarkably hardy sort; standing the winter's frost without injury, podding about the first of June, and ripening in the latter end of July. It may be sown any time between the 15th of September, and the middle of October. Any wheat stubble, in pretty good heart, is suitable; and no particular preparation of the ground is necessary. Its early podding secures it from the attack of both insects and mildew ;- and being so soon off the ground is an advantage which need not be pointed out to the practical farmer. The produce is about four quarters per acre. We hear Messrs Gibbs, seedmen, Piccadilly, have been cultivating them to some extent, and of course can supply the seed in any moderate quantity."-British Farmer's Magazine, vol. ii. No. 6, p. 72.

" SOWING FIELD PEAS.

A correspondent requests information on a practice which is new to him, and may be also to many of our readers, namely, the sowing of field peas late in the autumn, which are said to resist the severity of winter, ripen considerably earlier than peas sown in the spring, and to be equally, if not more prolific, than the latter usually are."-Ib. No. 7, p. 206.

Last winter a vagrant, grog-drinking tinker, straggled into South Hadley, and romained there some time, getting tipsy as often as he could procure the means. On a stormy day in March, he left a house on the plain to go to the Canal, but did not return, and nobody knew what had become of him. On the 15th inst, a dead body was found in the woods a few rods from the road, and about a mile from the Canal; and the clothes showed that it was the body of the vagrant. It was in a putrid state, and the head was torn to pieces, probably by dogs .- Hamp. Gaz.

English Pronunciation .- Most English works of merit appear in Germany in the original, or in translations. To translate English prose is very easy to the Germans, but they complain much of our pronunciation, which is, to them, a perfect It is incomprehensible to them that enough and though should not rhyme, and that enough and bluff should. The greatest difficulty, however, is the th of our language, which is harder to them than Shibboleth was for the Ephraimites. Mr Dwight, a late American traveller, says he never met with but one German who could say, thirty-three thousand things. With all their efforts, and after screwing and twisting their faces into all shapes, they can only bring forth dirty dree dousand dings .- Ibid.

Wool .- Large quantities of grade and full blood wool from this county, Berkshire, &c. have been sold to the manufacturers within a few weeks; but we have not been able to obtain so accurate information respecting prices as we could wish. Some has been sold as low as 25 cents, and we have heard of one lot which brought 43 cents.-We believe that the greater part has been sold for from 30 to 35 cents; the average does not probably exceed 32 or 33 cents. The fleeces may have averaged between 90 and 100 cents each. Grain.-Three or four boat loads of grain have to rise.

oats 38 cents. These were the wholesale prices; Port Muhon, "two Jacks, four Jennies, a Thibet the retail price for rye is about 92 cents, and of Ram, and a Turkish Horse—the latter a most corn about 75 or 80 cents. low after harvest .- Ibid.

OVER TRADING.

The following remarks are as applicable to other villages as to Middlebury.]

There is, beyond doubt, too great a disposition to over-trade among the people-a habit of swelling expenses so as to pledge the income of a season in advance, rather than a determination to curtail them within the amount of earnings already made. A friend of ours has made an estimate, founded upon considerable inquiry, of the amount probably due at this moment to the merchants of our village. He assured himself, that it did not fall much short of one hundred thousand dollars; and it is probably safe to say, that from 30 to 40,000 dollars of this sum is due by citizens of Middlebury alone. Now we wish to inquire of our friends,-and an inquiry of the sort may be appropriately made in almost any town,-how this heavy deht is to be paid off? What must be the inevitable result, if merchants in Boston and New York, who are already much pressed, should demand of our country dealers a prompt payment? These will not consent to stop business until they have pursued their customers through the courts of law; and where in Middlebury can \$30,000 or even \$10,000 be raised to pay off the shopkeepers without great perplexity and sacrifice? It is unquestionably true, and it is a fact upon which we wish the people to think, that the property of many of our citizens is indirectly at the mercy of the merchants in large towns; and that commercial revulsions, which are sudden and not unfrequent, may compel them to discharge their debts by a sacrifice of entire estates. It is the object of our present brief remarks to call the attention of the farmer and mechanic to a subject at all times interesting, and one which may be of mercial and manufacturing difficulty—such as we much service to the ground, already so much disastrous importance to them in times of comapprehend will in some degree soon be felt. We parched, while the air continued so alarmingly cannot too often repeat that the system of over-American.

Making Butter in Winter .- A writer in the American Farmer, asserts that the quality of butter is injured in proportion to the time which the cream takes to rise; and that cream which has been long rising, requires more labor and time in sumption. Corn is said to be two dollars a barrel, churning. To expedite the rise of the cream, and hay is two dollars a hundred." the vessels containing the milk should be kept in warm water of uniform temperature. Cream obtained in this way produces sweeter butter, and passed prohibiting the circulation of any bank than twenty-live minutes.

The object of setting pans of milk in cool water, in summer, is to prevent the milk from becoming sour, and afford the cream a longer time

The Baltimore Chronicle mentions, that Capt. been brought to Northampton from Vermont.—
The Baltimore Chronicle mentions, that Capt.
Keurney, of the Navy, has brought with him from ly formed, can climb like a goat, and is remarka-The crops of grain are said to be promising in bly docile. The ram, which is on the farm of all parts of the country, and the prices must be Robert Oliver, Esq., is of the species celebrated for its very broad tail, and for the delicious flavor of the mutton. One of the Jennies is three years old, and only about thirty inches high, but proportionably formed, and is truly an interesting animal."-L. I. Star.

> Muscatel Grapes .- The Muscatel grape vine has been raised near Adamsville, South Carolina, from the seed of the raisin. A late paper from that quarter says, " the vines are apparently thrifty and flourishing, and hid fair to produce fruit this season. We sincerely hope that the attempt to naturalize this delicious exotic may be crowned with success, and at the same time recommend to our agricultural readers a further trial of the experiment."-. Masonic Record.

Oranges .- This excellent fruit finds a congenial soil in the territory of Florida. It is computed that upwards of fifteen hundred thousand cranges are gathered every year at St Augustine. Many of the trees, (says Mr White, the Florida delegate in Congress,) bearing 4000 oranges, are believed to be 120 years old. The lemon, citron, lime, and olive thrive equally well .- Belridere Apollo.

Transplanting Cedars .- About the year 1920, in the month of February, when there was no frost in the ground, I took up about eighty small cedars, retaining a small ball of earth about each, and planted them for a hedge. More than seventy of them are now living, and form a pretty close hedge, which has been trimmed to about breast high for several years .- . Im. Farmer.

The Weather .- Since the first week in June, the atmosphere has been so remarkably cool and dry, that some fears are entertained that the spring crops will be extremely light. The short showers which have occasionally fallen, could not be of trading—of living upon the liberal calculations of doubt. Indian corn will scarcely recover, even profits yet to be made—has kept and still keeps a should the weather become more congenial to its large portion of our fellow citizens in entire degrowth. Fruit of all kinds has suffered extremependence upon the merchant and speculator.— Vt. ly. Such are the prespects for the farmer, so far

> A writer in the Mohile Register of May 29, asks, "What are we to do for cern, and hav for our horses through the summer? There is not as much in our market as will answer the con-

It is now about six mouths since a law was requires, in the operation of churning, never more notes under the denomination of fire dollars, in Pennsylvania. This arrangement has met with general approbation and support. The numerous gangs of counterfeiters and passers of counterfeit money no longer find business in that State, and have retired to the State of New York.

PROCEEDINGS OF THE ESSEX AGRICUL- in the management of their tillage land—their TURAL SOCIETY.

We have received from a friend in Salem, a pamphlet of about 80 pages, containing an "Account of Premiums awarded in 1828, and a list of Premiums offered in 1829; with Col. Pickering's Address; and a list of Members of the Society."as well as our knowledge of the characters and objects of its authors assure us it merits. We intend, however, to give, either verbatim, or in substance, those parts which appear to be most inthe pessession of many of our readers. We will commence with an article which needs no other eulogy than its title conveys.

COL. PICKERING'S ADDRESS.

The Society may recollect, that at its two last annual meetings, I expressed a desire to be released from the duties of President, in which I have been serving from its first institution in 1817. Yielding, however, to the requests of members, I have continued in that station. But at the late meeting of the Trustees, I informed them of my positive determination to be no longer a candidate for the office.

Having come to this determination, I had concluded, on taking leave, to present to the Society a short address. But if I had contemplated making a formal discourse, circumstances since occurring would have prevented my making it. I can now offer only a few desultory observations.

I. Within my memory, the ideas generally entertained of the occupation of the husbandman, appear to me to have materially changed. It has ceased to be considered as an employment adapted only to that portion of society which was to consist of mere laborers. It is now deemed an honorable pursuit, by engaging in which, no man, however elevated may have been his birth or station, feels himself humbled, in partaking of its labors. On the contrary, men of the learned professions-others who inherit fortunes, or who gravel, on the highways or elsewhere. have acquired them by their own industry in othcr employments, now not unfrequently engage with zeal in the business of the practical farmer; and with useful emulation, they strive to excel in their new occupation. This, it is true, does not yield them profits like their former pursuits, which, indeed, they neither expect nor desire; but are content if they sustain no loss; while their improvements, effected by more ample pecuniary means, and proving what is practicable, present useful examples to their neighbors, who, bred to husbandry, and constantly present at every operation, and diligently laboring with their own bands, will render such improvements more profitable than they were to those who introduced them .-This change of public sentiment is ausplcious to the farming interest.

2. I may here mention another source of improvements in husbandry-the mutual communications of valuable discoveries and useful practices. These may be most conveniently made to the Trustees, by the members of the Society : for the business of the annual meetings will not admit of making such things known in conversation. If all the members were to write in detail their several practices, in every branch of husbandry,-

mowing grounds-their pastures-their live stock their manures, &c., and hand them to the Trustees, to be examined and compared,-it is probable that in the main the practices would be substantially similar; but at the same time I have no doubt there would be some variations well with that attention, which a glance at its contents, some new tools, or new forms of old ones, and some easier modes of operating to produce the same effects. All these matters may be selected and arranged by the Trustees, and communicated to the whole Society at its annual meetings .teresting and useful to the public at large. We However small some of the improvements might would give it in extense, but a part of it we have be, yet they must be worth knowing, because they had published it in the fourth volume of their

When living on my farm, some fifteen or twenty years ago, my potatoes were dug up with was set, would turn out the potatoes, not only without cutting them, but with greater ease and despatch. I had such a tool made-and then a second; for it fully answered my expectation .-The potato tops, or vines, being pulled up and upper corner behind shall overhang the lower suflaid aside, two strokes of the tool thrust in under ficiently to effect a complete turning of the furthe potatoes, then raising it, and with a short sweep throwing the earth and potatoes once to the right and once to the left, would bring up and display nearly all the potatoes in a hill. The blade of the New England broad hoe is eight or nine Brighton a plough with a mould board very nearinches in length, on its edge, and five or six inches broad, from the edge to the handle. Five times seven inches long, and the two outer ones eight inches apart, will give the proper dimensions to the potato hoe, or crome.* The eye for the handle should be rather larger than that of a common hoe, and of greater length, to admit a bigger handle, which will also add to its durability. A few years afterwards, I saw, somewhere, a tool of the same form, for the same purpose. The same tool is far better than a hoe for levelling heaps of

Such mutual information as I have here recommended, is a species of charity or benevolence: I may therefore say, on high authority, " To do good and to communicate forget not."

3. I will make some remarks on the construction of ploughs.

It is not so much the weight as the shape of a plough which makes it of easier or harder draft: and this depends chiefly on the mould board.

Forty years ago, I had a farm in Pennsylvania, part of which was rich bottom land-the same which in New England is called intervale. Part of this was in a state of tillage when I bought it. I had a good Pennsylvania plough, of the fashion of that day; but the mould hoard was hollow breasted; and that rich soil, being moist, would fill up the hollow, and there remain, clogging the plough. But I observed that the earth thus lodged formed a straight line from the point of the mould board to the overhanging upper corner at the tail; and it then struck me, that this straight line should be given to the mould board itself; and be the guide to the ploughwright in forming the curvature or winding of the mould board.

A few years afterwards, returning to live in Philadelphia, I called one evening to see the Vice President of the Philadelphia Society of Agriculture; when he presented to me a small model of a mould board, which Mr Jefferson then Vice President of the United States) had left with him. We have not yet had leisure to peruse this work worth knowing; besides some new practices, and line above described; and stretching a thread from At the first glance of my eye, I saw the straight the fore point of the mould board to its upper corner behind, I found it touched it, in its whole length, in a perfectly straight line.

Speaking of it afterwards to Mr Jefferson, he told me that he had communicated a description are improvements. Let me give an instance of nansactions. There the manner of forming the mould board out of a piece of squared timber is minutely described. But the simple rule may be as follows: Having fixed the straight line, above common hoes, according to the usual practice; mentioned, by one cut of a saw from the upper but I observed that many were cut with the hoes, corner of the mould board behind to its point forand spoiled. It then occurred to me, that instead ward,—cut away the wood above and below that of a continued blade, four or five long teeth, or line in such manner, that when finished, if you tines, set to the handle just as the blade of a hoc carry a straight rule from the fore to the hind part, keeping it all the way at right angles with the straight line, it shall touch the face of the mould board, in its whole breadth, in straight lines, through its entire winding, and so that its row slice. Such a mould board can never get clogged; and the plough will move through the earth with less resistance than with a mould board of any other form. A few years ago I saw at ly in the form here described.

4. This Society have formerly offered premiums for the best management of manure. There can be no question, that if kept under cover, not unnecessarily exposed to the open air, and completely sheltered against rain, manure will retain more strength, and the same quantity fertilize a larger quantity of land. But another immense increase of manure will be obtained by conducting the urine of cattle, while they are kept in stahles, to large quantities of earth collected (in this climate) into cellars, among which the urine shall run and be absorbed. Accurate experiments during ten years, by a farmer in Scotland, proved, that the dung of a number of cattle carefully preserved by itself through the winter, furnished no more manure than the urine of the same cattle conducted over and absorbed by an equal bulk of common surface earth; the latter, load for load, being equally fertilizing with the dung.

5. A correspondent of a distinguished agricultural society in England, stated that he had made accurate experiments to ascertain the effect of cutting hay into very short pieces (whence it is called chaffing it,) and he found it a great saving of fodder; the hay so chaffed keeping his horses in as fine order as a much larger quantity given them uncut. A question has been asked-what causes this difference? The answer I have seen given was, that being chaffed it was more easily and perfectly digested. This is probably the true solution: and the effect would be more manifest in horses than in cattle and sheep which chew the cud. A celebrated English writer, treating of the rumination of some animals (their chewing **Crome is a word used in some parts of England, for the tool of two or three tines, with which manure is hauled out from local feet the gastric juice, of wonderful a cart; thence sometimes called, in this country, a dung drag. the cud); - and having spoken of a juice in the

following remarks:-

masticated [chewed]; that it only produces a slight maceration [softening] nearly as common when once vegetables are reduced to pieces by mastication, the fluid then exerts upon them its specific operation. Its first effect is to soften them, and to destroy their natural consistency; it then goes on to dissolve them; not sparing even the toughest parts." The inference from this doctrine is, that cutting fodder into fine parts will facilitate the maceration, mastication, and dissolution of the fodder; and consequently the preparation of its nutritive elements for admission into the numberless minute vessels destined to absorb and convey them through the whole system for the nourishment of the animal.

(To be concluded next week.) From the Gardener's Magazine.

On rendering Pear Trees and other Fruit Trees fruitful, by operating on the Borders, and by Natural Training. By Mr ROBERT HIVER.

SIR-There are few subjects in horticulture which can be more acceptable to your readers than a system by which good crops of fruit may be obtained from pear trees planted against the east and west walls in gentlemen's gardens; the bad crops these trees have afforded have been proverbial ever since I can remember; and the unnatural schemes which are now resorted to, such as strangulation, ringing, depressing of the branches, and reverse-grafting, show that a good system of cultivation is not yet established. failure has generally been imputed by gardeners to the climate; but as the trees are seldom withsupposition may be considered erroneous.

It is about twenty years ago since I noticed a Brown Beurre pear tree, trained against the east front of a farmer's cottage. This tree grew upon a limestone rock, where there was very little earth, yet it never failed to yield, yearly, plenty of large and well flavored fruit. From what I observed of this tree, it appeared evident that the rich and deep border, usually prepared by gardeners, was decidedly wrong, as the plants in this case generated too much sap, which always induces disease and barrenness; and, I believe, it will be found in the tree, as in the human constitution, that the state of health consists in the medium between emptiness and repletion. Sir H. Davy has shown the utility of stones in agricultural crops; and I have found them exceedingly beneficial in the formation of fruit tree borders; they prevent the accumulation of water in very wet weather, and also retain sufficient moisture for the purposes of the plant in dry seasons. In 1813, I replanted an old pear wall, 240 feet long: the border for these trees was 12 feet wide, and only 26 inches deep, 8 inches of which were filled with stones, such as could be most readily procured in the neighborhood, and the remaining 18 with the mould which composed the old border.

By this scanty supply of earth for the roots of these plants I have succeeded in obtaining a fruit- of a table spoonful, with as much wine. It will ful and healthy growth, equally remote from de- probably at first produce sickness at the stomach bility and luxuriance; and by this simple process and vomiting. Such are its effects sometimes, I procured fruit all over the tree, as regularly as if but it will cure. Ohio Repository.

it had been mechanically placed, both plentifully "It appears from experiments, that the gastric up the main stem, and on the lower portzontal fluids, of sheep, for example, has no effect in di- branches. My trees are fan-trained in the best besting plants inless that mey nave been previously manner; the shoots are kept as uniform and straight as the plications of the instrument from whence the term is derived, and, when the fruit water would do in a like degree of heat; but that is full grown, exhibit one of the most interesting seenes to be met with within the confines of a

With regard to pruning, the knife should be used as sparingly as possible; I conceive it to be as injurious to this tribe of fruit trees, as the lancet is to animal life; it creates those inconveniences which it is employed to remove; whoever indulges in its free use, most certainly defeats his own purpose. Let any man who is inclined to dissent from this opinion, consider the common hard, thorn confined in a hedge, where it annually undergoes the operation of clipping, and the shrub in its primitive growth, and he will want no arguments to convince him of the impropriety of the practice. But my plans require very little assistance from the knife : they make no breastwood, the energies of the tree being chiefly engaged in forming blossom-buds for the future crop.

It may be justly inferred, from what is here stated, that the bad success which most gardeners have experienced in the cultivation of this valuable fruit, arises principally from the luxuriant mer the water was changed once a week, and in state of their trees; the limited space which they occupy on the wall is so disproportionate to their natural growth, that it is almost impossible, with deep and highly manured borders, to reclaim them from a habit of plethorical sterility. The farina, and the whole fructification, partake of this unhealthy condition; and it may be observed, that fruits fecundated with bad pollen searcely ever resist the atmospheric changes which they afterwards encounter.

From observations made in vegetable physioloout fruit at the extremity of the branches, the gy, I am persuaded that the tree is principally the produce of the earth, and the fruit of the atmosphere; as great diminution of vigor may take place in the one, without any perceptible alteration in the other. It is, therefore, the first object of the cultivator to proportion the supply of nutriment to the extent of his tree, and this will be best effected by the shallow border above describ-

> These are the remarks of a man long devoted to the difficulties of his profession, such as have been suggested by nature, and confirmed by experience; and if they are found to be sufficiently instructive for the pages of your useful miscellany, I shall feel happy in being numbered amongst your many correspondents.

I am, Sir, yours, &e., ROBERT HIVER.

Indian Cure for Fever and Aguc .- David Ford a respectable citizen of Ogdensburg, New York, where this disease prevails to a considerable extent, recommends the following as a certain cure: Take equal quantities of inside bark of Fir Balsam and Yellow Birch-hoil them down to a very strong decoction, or tea. Give to a grown person two spoonfuls in the same quantity of wine, just before eating, three times a day; young persons in proportion-say, to a child five years old, 3ths

Observations on a Leech-made by a gentleman who kept one several years for the purpose of a weather glass. A phial of water, containing a leech, was kept in the lower frame of a chamber window sash, so that when I looked in the morning, I could know what would be the weather on the following day.

If the weather prove serene and beautiful, the leech lies motionless at the bottom of the glass, and rolled together in a spiral form.

If it rain before or after noon, it is found crept up to the top of its lodging, and there remains till the weather is settled.

If we are to have wind, the poor prisoner gallops through its limpid habitation with amazing swittness, and seldom rests till it begins to blow

If a remarkable storm of thunder and rain is to succeed, for some days before it lodges almost continually without the water, and discovers uneasiness in violent throes and convulsive-like mo-

In the frost, as in clear weather, it lies at the bottom. And in snow, as in rainy weather, it pitches its dwelling upon the very mouth of the phial.

The leech was kept in an eight-ounce phial, about three-fourths filled with water. In the sumthe winter once a fortuight. - Casket.

Mr Parmentier's Garden .- We lately visited Mr Parmentier's Horticultural Garden, situated at the junction of the Januaica and Flatbush turnpikes, two miles from Brooklyn. We remember this spot five years ago; it was then unenclosed, and as sterile and stony a piece of land as could be found for miles around-it is now a delightful spot, laid out with great beauty and taste, rich with all the flowers and shrubs of the season, both indigenous and exotic. The Garden, which contains twenty-five acres of land, nearly in a triangular shape, enclosed by a massive stone fence, is certainly one of the best planned and executed models that we have ever seen. The richness and variety in shape and color, of the various shrubs and flowers-the beautiful foliage and delicate blossomings of our native plants, render it a most attractive place. Those who are disposed to decorate their grounds with fruit and ornamental trees, will find every variety at Mr Parmentier's .- . V. Y. Enquirer.

The Legislature of New Jersey, at its late session, passed a law by which the coroner is released from the necessity of calling a jury of inquest, in ease of a violent, sudden, or casual death, unless he believes there is cause to suspect some one of being guilty of murder or manslaughter in the premises.

This is as it should be all over the country .--To summon a jury in every case of manifestly accidental death, is but the continuance of a most useless ancient custom. Cases may occur in which the investigation of a jury would be advisable. In such cases, leave it in the sound discretion of the coroner; but not one time in a hundred would the interposition of a jury be of the least utility.] - Col. Cent.

More than nine hundred miles of Canals and Rail Roads are finished, or under contract, in Pennsylvania, at this moment, all leading to Philadelphia market.

stitute," just published, contains a paper on the Uvulavia grandiflora, as a remedy for the bite of a rattlesnake, by James G. Tracy, that is worthy of some special notice. The writer furnishes the concurring opinions of several gentlemen as conhunter, who accompanied the commissioners for settling the boundary line between the United States and the British Possessions, In 1820 .-During this service, Hank performed several cures with this plant. It has a general resemblance to Solomon's Seal ; leaves alternate, smooth. and perforated by the stem, which is forked near the top; bearing one, rarely two, drooping liliaceous yellow flowers early in May .- Boston Trav-

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 3, 1829.

DECOCTION OF TOBACCO FOR SOAKING MELON SEEDS, &c.

In our paper of April 17, 1829, page 310 of the current volume, we published a communication, in which Mr "A. M. T." states in substance that he had learned from a person in Northampton. that soaking melon seed 24 bours in a decoction of tobacco, immediately previous to planting them would prove a preservative against bugs. The gentleman who favored us with the intimation is a merchant, of Boston, who owns a farm and superintends its cultivation in the neighborhood of this city; and whose note or assertion we are willing to indorse to any amount. The next news. on this subject, with which we were favored, was the following paragraph, which appeared in the Boston Traveller of the 16th nlt.

"The Editor of the Montpelier Watchman has tested the experiment recommended by the New England Farmer, to secure certain annual vines from bugs, by soaking the seeds in a decoction of tobacco. His success was overwhelming: the tobacco had got the start of the bugs; the secds and vincs also remain snug under ground."-Something of the same sort, has, we are told, been published in several other newspapers, though this is all that we have seen on the subject.

If the experiment has been tried, and found not to succeed, it is proper that the trial and failure should be made as public as possible. But one experiment is not sufficient to "test" the value of any proposed improvement. Perhaps the seeds of our Montpelier friend were too old to vegetate ;-or were planted on ground too wet :-or were soaked too long ;-or were planted too early in the season, or some other evil cause existed of which the decoction of tobacco was as innocent as the Editor of the N. E. Farmer, or his friend, in recommending the trial of it.

But the proposed improvement is not a matter of merriment. This undertaking to reward with a sneer, a disinterested effort to benefit the community, is not particularly praiseworthy. An attempt to do good, even if unsuccessful, is not a fit subject for satire. Besides we are not yet convinced, nor shall we be by any degree of ridicule, if ever so "overwhelming," that our tobacco-de-coction is not entitled to all the good qualities, as

number of the "Transactions of the Albany In- the tender leaves of vegetables, trees, &c. to destroy slugs, &c. without injuring the vegetation, but with sure destruction to the insects. Snuff. or the powder of tobacco, is also used to save young and tender plants from being injured by insects. We doubt whether a decoction can be renclusive proof that this plant is the same with that dered stronger, or more poisonous to vegetation used by one Hank Johnson, an adopted Indian than the pulverised leaves, and if snuff does no injury to tender plants, we can scarcely suppose that a watery extract from the leaves of tobacco will destroy seeds.

> But we have facts as well as arguments at our service in this case. The gentleman, who originally gave us information respecting the utility of the infusion of tobacco leaves for the purpose above mentioned, says he has tried it the present season for the following sorts of vines, viz. winter squash, cucumber, water melon, musk melon, and cantaleupe. That his seeds having been soaked 24 hours, all grew, the vines are all flourishing, and no insect has yet infested them. We hope that in due time he will give us further statements on the subject, sanctioned with his name.

It is thought by some that the vines will not acquire or retain enough of the flavor of the tobacco with which the seeds were imbued to deter the bugs from their depredations. But it is only while plants are very young that the insects injure them, and in the first stage of their growth their nourishment is principally derived from the parent seed, and of course will taste of tobacco. English writers have given the following as a method of preserving turnips from the fly. "To a quart of turnip seed add one ounce of brimstone finely powdered, putting both in a bottle, large enough to afford room to shake them well together every day for four or five days previous to sowing." If impregnating turnip seed with brimstone will preserve the plants originating from such seed from the fly, it is at least possible that soaking melon seeds with tobacco water might preserve the young vines which spring from such seeds from bugs .-And if a decaction of tobacco is useful in preserving melon vines from bugs, it is not unlikely that its use may be extended to the preservation of wheat from the Hessian fly, &c. &c. This, however, is conjecture, not assertion, and if we are wrong in our anticipations, we do not think it worth the while for paragraph-mongers to undertake to be witty thereupon. Abortive attempts at wit are altogether disgusting, and even genuine wit when misplaced or misapplied, is proof positive that its author wants good sense; and an onnce of good sense is worth mere than all the wit that ever stung in epigrams, sparkled in anacreontics, or blazed in scnatorial effusions of eloquence.

ON THE USE OF LIME FOR PRESERVING HEAL'TH.

Lime as an antidote to contagion, a preservative against infection, and a mean's of purifying vaults, is not so much used as it should be. By means of this simple but powerful agent, together with a due attention to cleanliness and ventilation, the air in jails, hospitals, ships, &c. may be rendered comparatively sweet and salubrious. A quantity of it, while bot and quick, sifted every d'ay or two into the vaults of back houses, would greatly contribute to comfort and health.

an anti-bugmatical preparation, which have been were forced to eat tainted provisions, or drink it will be well to turn swine into your orchard to

Remedy for the Bite of a Rattlesnake. The last attributed to it. We know it is often applied to filthy water, and yet seem very well satisfied with taking a substance into our lungs which is fit only to support the respiration of reptiles accustomed to "feed on the vapors of a dunghill." And this we suffer, while the remedy is at hand, and almost as cheap as the scrapings of the street !

The walls of cellars, dairy rooms, sitting rooms, and indeed of all apartments, which are much occupied by human beings should be well coated with good caustic lime white wash, at least once a year. The time for its application should be just before the heats of summer become fervent and oppressive. "In London," says Willich's Encyc." a Society is organised for the Cure and Prevention of Contagious Fevers in the Metropolis," and they have appropriated a certain sum of money for purifying the tainted habitations of the poor. Their method consists simply in washing the walls of the room with hot lime, which will render the place perfectly sweet."

In the villages of New England, the practice of white washing the walls and ceiling of dwelling apartments is very common; in cities less so .-The walls of the apartments of our more opplent citizens are usually decorated with costly paper, er something else, which would be spoiled by white washing; and if they prefer decorations to health, they must submit to the unwholesome annovance of a contaminated atmosphere.

JULY.

Clean and prepare your ground where your early crops of peas, spinach, cauliflowers, and cabbages grow, and all other vacant spots, to cultivate thereon such plants as are proper to supply your table, in autumn, and winter, with latergrown productions. You may continue to sow crops of small salading every eight or ten days, as directed in former months; but they should now be sown on shady borders, or else be shaded by mats, occasionally, from the mid-day sun, and frequently watered, both before and after the plants appear above ground. You may now plant out your celery plants in trenches, unless von have already performed that operation, as directed last month. About the middle of July, and from that time to the end of the first week in August, you may sow turnips. Thin and transplant such lettuces as were sown last month, and sow more lettuce seed in the beginning, middle, and last week of this month, in order to have a constant supply for the table. Sow likewise radishes, and in the last week of this month a good crop of spinach may be sown for autumn use; it will not then be so liable to run to seed as in the preceding months. It is a good practice to sow early kinds of cabbages about this time, for a supply of young greens during autumn. Collect all kinds of seeds as they come to maturity, cutting off, or pulling up the stems with the seeds attached, as they ripen. Spread them in some airy place under cover, turning them now and then, that the seeds may dry and harden gradually, and be careful not to lay them so thick as to hazard their heating and fermenting. When they are sufficiently dry, beat out and clean the seeds, and deposit them in bags or boxes till wanted. Give water to such plants as require it, but let this be always done in the evening, that it may be of use to the vegetables before the sun shall cause it to evaporate. You may now inoculate or bud your fruit trees,

We should think it a very serious matter if we and, where it can be done without inconvenience,

cat the fallen and decayed fruit, and thus destroy the insects which it contains. If, however, this cannot well be done, or you have not swine in sufficient numbers to devour all your fallen fruit, it will be well to gather and carry it from the ground before the insects, which inhabit it, make their way into the earth, and make you destructive visitations another season.

Preservation of Timber .- An English writer says that " Green fir timber may be scasoned and rendered fit for immediate use by soaking the planks or round trees barked, a few days in lime water; or paying them over with lime along with water. Lime water is made by slacking the lime in water, and the hotter it is used after the lime is slacked the better." If " fir timber" can be seasoned in this way, it is to be presumed that other kinds of timber may be benefited by the same process. The trial is easily made.

The July number of the North American Review, contains articles on the fullowing subjects:

Memoirs of a Financier-Principles of Elocution-History of Intellectual Philosophy-De Beranger's Life and Writings-The Greek Revolution-Abbot's Letters on Cuba-American Poems -Popular Education-Boston Exhibition of Pictures-Constitutional History-Quarterly list of New Publications.

Spirits .- The N. Y. Commercial Advertiser of Saturday says: "The market for spirits is very dull, and prices have been greatly reduced; this is accounted for in the falling off of the consumption of every description of spirituous liquors."

A child was poisoned at Westchester, a few days ago, (though not fatally,) by eating the root of a plant which had been gathered for spike-This plant somewhat resembles spikenard in taste and smell, but its foliage is smaller; it attains the height of three or four feet, has white blossoms resembling the carrot, though not as dense: it has been called Wild Carrot.

Monday and Tuesday of this week were appointed, for shearing the remnant of the flock of sheep upon Nautucket Island. The Inquirer calls it a remnant, because more than half perished last winter, the cold being severe, and no shelter afforded them.

Locusts .- A Shawneetown (Illinois) paper says "Immense swarms of these insects fill our forests and fields-making the air vocal in the chill of the morning, with a low melancholy murmuring; afterwards when the heat of the sun has warmed them into action, with an almost deafening noise. They made their appearance about ten days ago."

The Augusta, Geo. paper says :- "The Locusts which are numerous in the swamp and oak woods in this vicinity, are destroying the leaves of the fruit and forest trees in some parts of the country. They are so numerous in the swamps below this city, that a respectable planter told us the other day, that his hogs were getting fat on them. They are small, but little larger than the large horse fly, and make a noise like the tree frog."

Pigeons .- We learn from Saratoga county, and the northern parts of this State, that great mischief has been done to the Indian corn this season, by the wild pigeons which flock in those regions They attack the corn in immense numbers. fields, pull up, or scratch up the young stalks, and eat the kernel at the root. We have heard it stated by a gentleman whose fields have been ravaged in this way, that he believed at least a hundred acres of young corn have been destroyed in Saratoga county. They also make great havoc among the oats.

THE DORCHESTER PREVENTIVE SOCIETY THE DORCHESTER FREE ENTRY SOCIETY. At meeting of a respectable number of the inhabitants of Direhester, convened for the purpose of organising a Society, for the Protection of Fields, Gardens, and Orchards in said

town, after having elected JOSHUA GARDNER, Esq., President, SAMUEL DUWNER, Vice do
NATH'L CLATE, Treasurer and Secretary,

MISCELLANIES.

UNPRINCIPLED AMBITION.

BY T. G. FESSENDEN.

When men of agrogance attempt to soar Above the limits of their destin'd sphere, Their every effort serves to sink them lower, Curtail'd and baffled in their mad carcer.

Yet witless wights, in rash pursuit of fame, Strive for preeminence of power and place, Who, if they gain the rank at which they aim, Become the heralds of their own disgrace.

Some fools are smitten with the love of dress. And spend their little all to make a show, Pride proves the cause and prelude of distress, Attempts at high life bring the coxcombs low.

Some splendid sinners, proud of being vile. For genteel vices high pretensions urge. Enact the rake, and debauchee, in style, -And claim a wreath for meriting a scourge,

Some place their pride in wealth by froud obtain'd, Cash, houses, lands, the perquisites of guilt; The conqueror boasts of battles he has gain'd, And laurels, drench'd in blood unjustly spilt.

All such vain boasters glory in their shame, The mecd of vice no honor can bestow, Impell'd by pride, bad emineuce their aim, They gain at last preeminence in wo.

From the first annual report of the New York Society for the encouragement of faithful domestic servants.

Friendly Advice to Servants.- Servants that often change their situations are always poor.

Never quit a place of your own accord, except think you did right.

A good character is a fortune to a servant.

Be moderate in your wages-many very good places are lost by asking too much. Keep your temper and tongue under government. Never altv. give your employer a sharp answer, nor be in a hurry to excuse yourself.

When you hire yourself, be candid and explicit as to your qualifications and connexions, and observe well what is required of you, so as to remember and practice it.

Always prefer a situation where you may regularly have an opportunity of attending public worship.

Be very honest in speaking the truth, and in all your dealings. It is an honor to be thought trustworthy; and honesty is always the best

Rise carly, and your services will give more sat-

If your employers be worthy people, be more sure to make them your friends.

- Dont spend any part of the Sabbath in idleness, or in walking about for pleasure; but KEEP THIS DAY HOLY TO THE LORD, as he has commanded: not thinking your own thoughts, or speaking your own words.

Watch against daintiness and extravagance, and be careful of your employer's property as want.

Be quick on errands, and whenever you walk alone.

Leave every place respectfully. It is your Dutch.

duty, and you know not what friends you may

A truly faithful servant will seldom long want a place.

Green Fruit .-- It may not be amiss to remind parents, and all those who have the immediate oversight of children, that unripe fruit will soon appear in our market. It is probable that more children's lives are destroyed, in the summer, by this cause of disease, than almost all others put together. Apples, which are shaken from the trees by violent winds, or fall prematurely by decay, are immediately gathered and brought to market; the display of them is too tempting to children to be withstood; and of course they are purchased and eaten. Nothing is more pernicious; and yet nothing is more common, than to see children and young persons cating this kind of fruit. We should think that parents would lay a most strict injunction against this indulgence to their children. They must, unless they can make up their minds to risk their health and their

Strength of Men .- The strength of savages has frequently been represented as far superior to that of man in a civilized state: towards the close of the last century an ingenious instrument to which he gave the name of dynanometer, was invented by Mr Regnier, of Semur, for determining with precision, both human power and that of machinery. This was employed by Peron in his voyage to New Holland, and this able navigator has shown that the strength of savages is uniformly less than that of civilized men .- Med. Intel.

The drinking of spirituous liquors has been proon such account that in distress or death, you will hibited in one of the islands of Owhyhee, under the penalty of five hogs; the chiefs, who are the law-makers, no doubt, have discovered that the excessive use of strong drink assimilated men to hogs, and have conceived of se appropriate a pen-

> Fleetness of the Reindeer .- In consequence of the Norwegians making a sudden and unexpected irruption into the Swedish territories, an officer was despatched with a sledge and reindeer to Stockholm, to convey the intelligence; which he did with such speed that he performed 124 Swedish miles (about 800 English) in 48 hours; but his faithful animal dropped down lifeless on the Biddarhustorget, just after his arrival in the capital. The bearer of the news, as it is said, was in consequence ennobled, and assumed the name of Rhens-jurna, (Reindeer Star.)-Brooks' Winter in Lapland.

There are sixty Nuns in the Georgetown Convent, Washington. They are schooled two days in the week in the art of making pies, tarts, puddings, &c., besides French music, the guitar, and to dance gracefully.

The Troy Budget states that there is a man now residing within the gaol liberties of that city, who has been confined within those limits more than you are of your own. Willful waste makes woful twelve years, for the non payment of damages recovered against him for slanderous words spoken by his wife. What is not a little singnlar, is, that the slanderous words were spoken in

Generosity of Lafayette. This good and benevolent man has ordered his lands in the United States to be sold to discharge the debts of Mr Monroe. Mr Monroe has refused to permit it, but the agent has orders to proceed, at all events to execute his instruction. This is the reason why Lafayette's land has lately been offered in the market .- Mass. Journal.

Upwards of five thousand children are enjoying the benefits of free instruction, in the public schools of the first school district, Philadelphia.

Seed Potatoes.

For sale, at No. 26 Foster's wharf, 200 bushels of superior Nova Scotia Potatoes. A fine opportunity is here offered to farmers, who wish to improve the quality of their seed potajune 5

English Scythes.

James Cam's double prime grass scythes, wide and narrow, a superior article, for sale at the Hardware Store of S. FES-SENDEN, No. 80 State Street. 8t June 19

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

COMPOSITION OF SOILS, &c.

"He that carts sand makes land;

"He that carts clay throws his land away."

My text may be found in a former number of this paper. The sentiment that seems to be advanced by the writer, is, that sand is beneficial as a manure for all soils, and in every situation, and that the use of clay will be destructive and ruinous to all soils whatever. If his views are such as we have reason to believe they are, we must consider him ignorant of the composition of the soils, and the nature of the several earths which enter into its composition, in order to render it productive and fruitful.

That some soils can be improved and rendered productive by the use of sand, we by no means deny; but the use of sand will be beneficial only to such soils as are destitute of, or have too small a proportion of silicious earth; on the contrary the composition and situation of some soils are such as would be injured by the use of sand, and improved by clay; but clay will be found useful only in such soils as have too small a proportion of aluminous earth, and abound with silicious sand. Such soils may be improved by adding finely divided coherent absorbent matter, such as aluminous and calcareous earth. Elevated land requires to be more absorbent and retentive of moisture than low land. Low moist soils are often very productive when they consist of more than three-fourths silicious sand, and less than one-fourth of finely divided coherent matter, and vegetable ma-

As the earths of which the soil is composed differ with regard to their affinity to water, and absorbent power, it is evident that soils to be equally productive in different situations must be differently composed, or composed of the several earths in a different proportion. Hence, if a soil be found to be sterile, before we attempt an improvement, the cause of its sterility should be first ascertained if possible; otherwise we may expend time and manure to no purpose. If there be an excess of silicions sand, clay, finely divided coherent matter, and calcareous earth should be added: if the soil be too close, heavy, and coherent, a want of sand and vegetable matter is indicated; if there be an excess of vegetable matter, or the salts of iron be present, it may be improved by lime, which will render the salts of iron beneficial, by combining with one of its component parts, and thereby form a new and different salt, which will promote vegetation, and at the same time hasten the decomposition of the vegetable matter. If there be a deficiency of vegetable matter, the remedy is obvious. Too great a proportion of either of the earths will not produce a healthy plant, though it may have a due supply of vegetable manure. As it is necessary, then, that the soil should be composed of the earths in a due bright red. proportion to render it productive, and as that proportion is not altered, (for the quality of lands that enter into the composition of plants is ex-

tremely minute and small) the agriculturist will be well rewarded for his lahor in correcting his soil; for when once done, it will continue productive with a supply of vegetable manure.

It is difficult, it is true, to account for, or assign any reasons why a soil should be composed of definite proportions of the earths to render it productive, since the plant does not depend upon them for its food and nourishment, but receives it from the vegetable matter, water, and saline matter contained in the soil, and from principles which it receives from the atmosphere.

That water is decomposed, and its component parts combine with, and form a part of the vegetable, may be satisfactorily shown by simple experiments. Immerse a fresh plant in water, in a few hours bubbles of air will be seen upon its surface, which, if examined, will be found to be oxygen gas, its source is obvious. A portion of the water has been decomposed, and as no hydrogen appears, it is evident that it has entered into composition with, and forms a part of the plant; the excess of oxygen being thrown off through the leaves. It is ascertained by experiment that plants receive their carbon from the atmosphere, through the leaves, hence the leaves of a plant, are of as much importance as the roots, and it will thrive no better without one than without the other .-Nature has wisely provided other resources for the elementary principles which compose a plant, than the vegetable and saline matter contained in the soil. Were it not for such a provision, the soil would inevitably become impoverished, and sterile, for it would be impossible to return to the land the whole amount of vegetable matter, that is teden from it by the crops. Hence sterility would be inevitable. On the other hand, if vegetation received its whole support and nourishment from the atmosphere, and nothing from manure, one great incentive to industry and its reward would be lost, our door yards, and barn yards would increase with dirt, filth, and decayed vegetable matter, for want of sufficient inducement to remove it, the soil would grow foul, and in time, become a kind of peat earth, which would render it unfit R. I. FARMER. for cultivation.

FOR THE NEW ENGLAND FARMER.

FINE STOCK.

Ma Fessenden—I observed in your last New England Farmer, a statement of Mr Jeremiah Stickner, of Rowley, of the thrift of his calf.—This spring I have had forty calves, five of them attracted my attention at their birth. I accordingly had them weighed and their weights are as follows.

One pair twin calves, bulls, 125 lbs. One bull calf, 103 One bull calf, 98

One bull calf came 5th March last, 70. This 1 weighed yesterday, and weighed 390 lbs, which is a gain of 23 lbs. per day, and a fraction over, in 116 days. He is of the Holderness breed, of a bright red

Your friend and humble servant,
JOHN LANE BOYLSTON.

Princeton, June 30, 1829,

FOR THE NEW ENGLAND FARMER.

MASSACHUSETTS HORTICULTURAL SO-

MR EDITOR—Having received a communication from John Lowell, Esq., in which he generously offers to furnish buds of his choice varieties of pears, to the members of the Massachusetts Horticultural Society, I enclose it for publication, as there will not be a meeting of the Society for some weeks, that all may have an opportunity of availing of the privilege which has been so liberally extended.

As many will desire to participate in the benefit, it should be recollected that the supply of buds is necessarily limited, and that the request of each should be such, as that the favor may be generally enjoyed.

These repeated demonstrations of Mr Lowell's bounty, and his zealous efforts for the advancement of horticulture, are most cheering to our Institution, and entitle him to our grateful acknowledgments. His benefactions, precepts, and examples have rendered his name dear to the cultivators of New England.

Very respectfully,

Your most obedient servant,

H. A. S. DEARBORN, Pres. Mass. Hort. Soc.

Brinley Place, July 4, 1829.

Hon. H. A. S. DEARBORN,

Pres. Mass. Hort. Society,

Deaa Sta—I overlooked, when I sent to your care a few books for the Massachusetts Horticultural Society, on odd volume of the London Hort. Transactio, which became a supernumerary one, owing to the great liberality of that Society in presenting to me, unsolicited, the first and second volumes of that valuable work. I wish that it was more worthy of their acceptance, and that it were possible for me to part with the complete set of that splendid work—but it is my viaticum. I could not get on without it. I hope one day, that it will form a part of your Library, and if the members shall feel disposed to purchase it entire, I wish to be considered a contributer to the amount of 30 dollars.

The time is now approaching for budding pears, and some are now fit to bud. The members of your Society may call upon me freely for buds of all the original trees of Mr Knight, received six years since, and I can also furnish buds of some of the valuable kinds sent last year. The last are few, and precious, as they are in no catalogue in this country, and I could wish that your Society should designate the persons, who should take them, as it is important that they should pass into the hands of those, who will be most likely to preserve them.

I am, dear sir, respectfully yours,
Roxbury, June. 30.

J. LOWELL.

N. B. From present appearances, I hope to be able to send to your Society, specimens of at least six of the new varieties of pears; and there is good reason to hope that they will be exempt from the diseases which have reodered what were once our most valuable pears of no value to us.

FOR THE NEW ENGLAND FARMER.

AMERICAN TURNIP BUTTERFLY.

In Europe there are several species of butterfly appropriated to the cruciferous or oleraceous plants, such as the cabbage, cauliflower, rape, turnip, mustard, &c., whence they are called brassicaires* by the French. Their caterpillars feed upon the leaves of these vegetables, and sometimes do considerable injury to them. The prevailing color of the butterflies is white, and that of the caterpillars

Several years since I obtained, in Northampton, a white butterfly, which appeared to be allied to the European insects above mentioned .--Doct. Charles Pickering discovered one, previously, near the White Mountains, New Hampshire; and a chrysalis was brought to me, by a friend, from Keene, in the same State, in the winter of 1827. I have since received, through the attentions of the Rev. L. W. LEONARD, several of the chrysalids and eggs, and some interesting observations on the economy of the caterpillars, which are found abundantly on the turnip, cabbage, and radish, in the vicinity of the Monadnoc Mountains, N. H., and in the northern part of Worcester county, Massachusetts. Having been so fortunate as to raise the perfect insect from the egg, I am now enabled to furnish a history of this species, which threatens to become injurious to

There are two broods in a season. About the last of May and the beginning of June the white butterfly is seen fluttering over the plantations of cabbages, and the turnip, and radish beds, but "seems to prefer the turnip leaf for the place of depositing her eggs. She alights upon the upper side of the edge of the leaf, bends her abdomen, and fastens the egg, on its end, under it. The eggs are not laid near each other, and but seldom more than three or four under the same leaf."t-The egg is nearly pear-shaped, longitudinally ribbed, and about one-fifteenth of an inch in length. " Eggs kept in the house were hatched in seven days, a somewhat longer time was necessary for the hatching of those in the open air." The caterpillars or larvæ, which I reared from eggs hatched upon the 27th of May, arrived at their full size in 21 days, when they were one inch and a quarter in length. Being of a pale green color they were not readily distinguished from the ribs of the leaves, beneath which they reside. They do not devour the leaf at its edge, but commence, indiscriminately, upon any part of its inferior surface, through which they eat irregular holes.

On the 17th of June, one of my caterpillars ceased eating, and spun, from its mouth, a little web of silk on the glass under which it was confined; in this web it attached the minute claws which arm the pair of feet at its hinder extremity : then bent the head on one side, and fixed, upon the glass nearly under the middle of the body, a silken filament, which it carried across the back and secured on the other side : this operation was repeated till a thread of sufficient thickness was produced to form a loop in which the anterior part of the body was suspended. On the next day the skin, near the head, was rent, by the exertions of the caterpillar, and was gradually cast off, leaving the chrysalis or pupa sustained by its tail and the

* From Brassica, the generic name of the cabbage, turnip,

rape, &c.
† The observations, within inverted commas, were communicated by Mr Leonard.

at base, and the posterior ones have dusky veins Nicippe is a true Collas. The butterflies disclosed in summer beneath. August." The pupe of this second brood survive the winter, and do not produce butterflies tillthe ensuing spring. Mr LEONARD informed me that the pupe are found under rails, the edges of the larva. stones, and in other sheltered situations in gardens and fields; and suggests that it would be well to leave, in the places infested by the caterpillars, boards a little elevated from the ground, which would offer a tempting shelter to the pupæ, and render it easy for the farmer to obtain and destrov them.

Mr LEONARD noticed the white butterfly in all the towns in the vicinity of the Monadnoc Mountain, and also in Ashby, Fitchburg, Athol, Winchendon, Templeton, and Petersham, Mass. That it may, eventually, extend itself still farther is to be apprehended, nnless means are used to check its increase. It was in May, 1826, that I found a solitary one in Northampton, but I have not 1 1-4 inch. heard whether it has become common in Hampshire county.

In concluding this account of the white butterfly it will be proper to point out its entomological situation and characters, and assign it an appropriate scientific name.

ORDER LEPIDOPTERA. Section Diurna. FAMILY PAPILIONIDÆ.

Genus Pontia. Fab. Ochsenheimer. Leach. Stephens.

GENERIC CHARACTER.* Legs six, alike in both sexes. Wings entire, opaque; anterior somewhat triangular, obtuse-angled or rounded at tip, generally white with some black spots; posterior rounded with a groove on the inner margin to receive the abdomen, beneath often colored yellowish or greenish; areola in the centre obliquely closed by a straight connecting nervure. Antenna with an abrupt, obconic, compressed club .- Pupa angular, acuminated in front, with projecting lateral appendages in front fore these vegetables were introduced by the Anof the wing-cases. The body suspended by the tail and a transverse thread across the middle .--Larva with a small round head; body slender, tapering at each end, downy, with a dark dorsal line.

Observations. This genus is nearly related to Collas, of which genus we have several species in the United States, but only one true PONTIA to my knowledge. The common small, yellow butterfly is a Collas, which may be distinguished from PONTIA by the prevailing yellow or orange colors of the species, the short antennæ, with the gradually formed obconic club, and the areola in the posterior wings completed by an angulated connecting nervure. The pupa of Collas is gibbous, the anterior extremity very obtusely conical, or not much produced, no lateral elevated angles, and no prominent dorsal projections. The larva has no central, longitudinal stripe. The flight of the PONTIA is heavy and low; that of COLIAS is light, and is sometimes extended to a great height. These two genera, together with Mancipia, Leu-COPHASIA, and GONEPTERYX, (of which I believe there are no species in New England,) are established upon a critical examination of the pupe and larvæ, as well as of the perfect insects, and in their

transverse loop. In eleven days, on the 29th of propriety I fully coincide. Schrank and Latreille. June, the butterfly burst its pupa case, and extri- unite them all in the genus Pieris, and appear to cated itself. The wings are white, a little dusky be followed in this by Prof. Say, whose Pieris

The subject of this communication has a close "deposit their eggs from the middle to the end of affinity to P. Napi of Europe, but it is a large insect, and somewhat differently colored. Under the impression that it is a nondescript, I have given it a specific name derived from the habitat of

PONTIA Oleracea.

Specific Character. Wings white, sub-diaphanous, anterior ones dusky at base, and on the external edge, tip beneath pale yellow with fuscous veins: Posterior wings beneath straw colored with fuscous veins, humeral angle yellow. Body black, with cinereous hairs above, and whitish ones beneath. Antennæ black brown, annulated with white scales; apex pale ochreous.

Expansion of the wings about two inches.

Egg pyri form, longitudinally ribbed, yellowish. Larva pale green, with a darker dorsal line, very minutely punctured with darker spots, and inconspicuously downy. Length, at full size,

Pupa pale green or white, regularly and finely spotted with black; anterior extremity produced, conical, back before, with an elevated, laterally compressed, securiform process, sides of the dorsum, in the middle, angular, and elevated; posterior part with a central carina. Length eighttenths of an inch.

Habitat (natural unknown;) on the leaves of BRASSICA Rapa, B. Oleracea, and RAPHANANUS sativus, in New Hampshire, and Massachusetts.

In a speculative point of view Pontia oleracea is exceedingly interesting to the naturalist, and a valuable addition to the American Fauna. It is, undoubtedly, an American insect, and sufficiently distinct from the European species of the same genus. Having, like them, an appetency for the cruciferous oleraceous plants (Tetradynamia siliquosa,) it has fixed itself upon the turnip, cabbage, and radish, which are not natives of the United States. On what, then, did the insect subsist beglo-Americans? It is to be hoped that those hotanists, who may have it in their power, will carefully look for the larvæ on the cruciferous plants of the elevated regions of New Hampshire, in the months of May and September.

T. W. HARRIS. Milton, Mass. June 30, 1829.

CHLORIDE OF LIME.

The last number of Silliman's Journal, contains a very interesting notice of the manufacture and uses of the chloride of lime, by G. W. Carpenter, chemist, of Philadelphia. We present to our readers, an abstract of this article, as one of the best evidences of the progress of American Manufactures, and the immense contributions of modern chemistry to the means of health and comfort.

The chloride of lime, is manufactured on a very large scale at the Maryland Chemical Works, and also by the New York Chemical Manufacturing Company; and both articles are pronounced to be fully equal to the best imported.

It has for many years been used in bleaching; hence its common name BLEACHING SALTS; but some of its most valuable properties have been but recently discovered.

The first property for which it is distinguished,

^{*} The characters in italics are extracted from Mr Childreo's translation of Ochsenheimer's genera.

is that of destroying colors; and so powerful is every saccharine or sugary solution, which has who is consured in company, so far as truth and this property, that one grain of the salt will destroy the coloring matter of two grains of the best Spanish indigo.

The use of this article for discharging colors is very extensive, especially in bleaching, calico printing, paper making, &c. Fruit stains, &c. in nature, into a bewitching poison. may be removed from bleached goods, by dipping the stain in water, applying the salt until it is removed, and rinsing well in cold water, before washing. It must not be applied to colored ages :goods, as it would remove all the colors togeth-

Another property for which the chloride of lime is now not less remarkable, is that of destroying all offensive or infectious effluvia, arising from animal and vegetable decomposition, and, indeed, every unpleasant odor whatever.

To prepare the salt for use, four ounces is dissolved in a pint of water, and the solution filtered. Put one part of the solution into forty parts of water-stir the mixture, and it is then fit for

The effluvia from-drains, sewers, and other receptacles of the same nature, will be destroyed. by pouring into them a quart of the mixture added to a pailful of water, and repeating the operation as often as occasion may require. Water in cisterns may be purified, and all animalculæ destroyed, by putting half a pint of the solution into about 120 gallons of the water.

Tainted meats, and animal food of every kind. may be rendered sweet, by sprinkling them with the mixture. The odor of dead bodies is effectually destroyed by the same means. By its aid, the French surgeons have been enabled to examine the bodies of persons supposed to have been poisoned, several months after interment. It also destroys entirely the smell of paints.*

There are many manufactures, and those of soap, candles, glue, size, leather, &c., that might be deprived of all disagreeableness from offensive smells, by the occasional use of a pot containing the mixture.

Finally, the chlorides have been found very beneficial in medical and surgical practice, from their power of arresting instantaneously, any tendency to putrefaction, and of destroying the deleterious properties of putrescent matters. Hence their application to carbuncle, ill conditioned ulcers, gangrenous sores, foul eruptions, open cancer, mortification, &c. Used as gargles or washes, they destroy the foulness of the breath, from whatever cause it may proceed-even that produced by mercurial salivation. For the latter purposes, the chloride of soda is used by the French, but the chloride of lime is said to answer equally well.

ALCOHOL.

Alcohol, according to Saussure, is composed of carbon, oxygen, and hydrogen, in the following proportions-C. 51.98, O. 34.42, H. 13.70=100. Its specific gravity is 791, water being 1000; but it can with difficulty be obtained so pure, and its more common specific gravity is 820. It was once supposed that alcohol was formed in the process of distillation; but Mr Brande has demonstrated that it is exclusively, the product of fermentation; and, therefore, that it exists in

undergone fermentation. Sugar, is, indeed, the indispensable material out of which alcohol is formed; and it is melancholy to reflect on the misapplication of art, in converting one of the opinions. most pleasant, harmless, and nourishing substances

The following table, compiled from Brande's Manual of Chemistry, shows the proportion in siast. which alcohol exists in several different bever-

From this table it appears, that in brandy, rum and whiskey, there is, by measure, more alcohol. than water; that Madeira and Port wines contain nearly half, strong cider about a fifth, and ale an eighth, as much as they. Thus, a bottle of Madeira has in it nearly a pint of proof spirit; a quart of strong cider more than six ounces; and a bottle of ale about four ounces.

The chemists were surprised at the results of Mr Brande's experiments. Nobody, till then, was aware, that the various fermented liquors contain so large a quantity of alcohol. Their intoxicating effects are certainly not in proportion. This arises from a scurf, composed of a mealy, sugary substance, their other ingredients; which give to all of them a neurishing quality, and to each, effects more or Dr DRAKE. less peculiar.

Excellent Rules .- The following rules, from the private papers of Dr West, were according to his memorandum, thrown together as general waymarks in the journey of life. They were advantageous to him, and while they exhibit an honorable testimeny to his moral worth, may be useful

Never to ridicule sacred things, or what others may esteem such, however absurd they may appear to me.

Never show levity where the people are professedly engaged in worship.

Never to resent a supposed injury, till I know the views and motives of the author of it-nor on any occasion to retaliate.

Never judge of a person's character by external appearance.

Always to take the part of an absent person

propriety will allow.

Never to think the worse of another on account of his differing from me in political or religious

Never to dispute if I can avoid it.

Not to dispute with a man more than seventy years old; nor with a woman; nor with an enthu-

Not to affect to be witty, or to jest, so as to wound the feelings of another,

To say as little as possible of myself and those who are near to me.

To aim at cheerfolness without levity.

Not to obtrude my advice masked.

Never to court the favor of the rich, by flattering either their vanity or their vices.

To respect virtue, though clothed in rags.

To speak with calmness and deliberation on all occasions; especially in circumstances which tend

Frequently to review my conduct, and note failings.

On all occasions to have in prospect the end of life and a future state.

Not to flatter myself that I can act up to these rules, however honestly I may aim at it.

Remedy against bad water .- A highly respectable gentleman in Connecticut, who used to visit Ohio yearly, gave me the following prescription. Being from early life a water drinker, he applied to the late Dr Osborn, of Middletown, to give him a substitute. The doctor told him to furnish himself with a mixture, of equal proportions, of pulverised sugar and ginger, and whenever he drank the bad water of the west, to put in as much of the composition as suited his taste, and he need never apprehend bad effects from a free use of the water,

He tried it a great number of years, and always found it an effectual preventive. At a time when the quality of the water, in the lower part of the city is made, by so many, an apology for the commencement of insidious and dangerous habits of mingling poison in their beverage, the adoption of this simple and self-preventive cannot be too earnestly recommended .- Norristown, (Pa.) Register.

To improve dried figs .- These fruits, when they are brought to table, are commonly covered with very disagreeable to the teeth. A correspondent says that the way to get rid of the scurf, and render the figs as plump and clear skinned as when they are newly gathered from the tree, is, first to keep them in a cool and rather moist cellar for twenty-four hours before using; and, secondly, just before presenting them at table, to put them into a receiver, and exhaust the air. After remaining there two minutes, they should be taken out, and gently brushed, when they will be found perfectly plump and clear skinned .- N. Y. pa.

Tooth Powder .- The following is given as the correct mode of preparing the celebrated French tooth powder, called Poudre Peruvienne: White sugar 36 grains, cream of tartar 72, magnesia 72. starch 72, mace 2, cinnamon 6, sulphate of quinine (or quinia) I, and carmine 5 grains. All these substances are reduced into a fine powder, and mixed together with great care; then add four drops of oil of roses, and as much oil of mint.

Ere. Gaz.

Query.—Would not apartments rendered disagreeable be
the neighborhood of vermin, be readily purified, by sprinkling
with the mixture?

COL. PICKERING'S ADDRESS.

Concluded from page 396.

6. If my recollection be correct, the Trustees of the State Society of Agriculture, have repeatedly offered premiums for the best experiments to ascertain the most eligible season for laying lands down to grass. Without having made any experiments expressly for that purpose, I will mention some facts which may contribute to settle the question.

When I purchased a farm in Pennsylvania, at the time before mentioned, it was deficient in hav. Some acres of the bottom land were in tillage; but there being no crop on the ground, it was ploughed, harrowed, and sowed with herd's grass (there called Timothy) and clover seeds, about the 15th or 20th of September. The seeds were well put in by an old experienced farmer. The next summer I had a full and clean crop of excellent hay. But here-and-there was a very small strip entirely destitute of grass plants; and in their place was a full crop of weeds; a stronger wind now and then preventing the hay seeds reaching their destined cast. But throughout the rest of the ground, the herd's grass, and clover having attained to some strength in autumn, had full possession of the ground; and renewing their growth in the spring, before the seeds of annual weeds had time to vegetate, kept that possession completely, and produced a clean crop of hav.

I will now mention the constant and successful practice of Capt. Ichabod Nichols, of Salem, who has made a very productive farm among the rocky hills and valleys of the land on the Salem Turnpike, immediately westward of the town. Having dug up and cleared it of the moveable rocks and stones, he ploughed and planted piece after piece, with Indian corn and potatoes; and as soon as the natural growths were subdued, laid the same down with herds grass; always sowing the seed in autumn; and invariably getting clean and large crops of hay the next summer. Sometimes he sowed the grass seed so late that it did not germinate until the spring; but being duly deposited, it was ready to start with the first warmth of the season, before the germination of the seeds of weeds; and when the ground would be too wet to touch it with the plough. It is only thirteen years since Mr Nichols began to cultivate this land; and in the present very productive year for hay, he has cut upwards of ninety tons. It is true that he has possessed an advantage within the reach of very few farmers-an ample supply of manure from stables in Salem; in addition to that made on the farm by his four working oxen, a bull, a horse, and thirty-five milch cows; all the hay and other fodder being consumed on the farm. It is a milk farm for supplying inhabitants of Salem. The grounds having received the manure with the tillage crops, it was, of course, thoroughly incorporated; and his purchased manure had so much clover seed mingled with it that he found it was not necessary to sow any with his herds grass. His constant practice of introducing his manure with his tillage crops, corresponds with the ideas I have formerly suggested; to wit,that upland grounds in grass for mowing should never receive top dressing of dung-because a large (perhaps the greater) part of its fertilising elements would evaporate and be lost in the air, and that such top dressings should be confined to

The general practice, however, from time immemorial, has been to sow grass seeds in the spring, with barley, or other small grain; and if the preceding tillage crops have brought the ground into a clean condition, the practice is known to be commonly successful; especially with clover, a plant whose tap root penetrates to a considerable depth, and thus secures it against the effects of the harvest sun of July, upon losing the shelter of the grain crop. But herds grass and other fibrous rooted grass plants, with very slender blades, not unfrequently perish. On my farm in Pennsylvania, one year, herds grass seed was sown with oats, of which there was a good crop: and the grass had taken well; but upon harvesting the oats, the tender grass plants, exposed to the burning sun of July, were all destroyed. The like disaster. I presume is sometimes experienced here, a degree and a half farther north.

I am therefore inclined to think, that all spring grain had better be sown by itself; and that after harvest, the stubble and weeds-constituting in fact a light coat of manure, should be ploughed in, and the grass seed then introduced. This manuring, I am satisfied, would amply compensate for the expense of the extra ploughing. It would be desirable that this operation should take place before the weeds growing among the stubble ripen

The ease with which the seed of herds grass is saved, and its cheapness when purchased, together with the good quality of the hav, have led to its general cultivation : but every farmer knows, that unless the ground be rich and moist, it yields uo grass for a fall pasture; while other grasses quickly throw up a second crop.

There is another grass in our country which in some parts of it is cultivated to great advantage. It makes good hay—equal I believe to herds grass—and like spire grass, springs again as soon as the first crop is taken off. And the seed, it appears to me, is saved with as much ease as the seed of herds grass. It is four or five years since I introduced it on my farm; and its present occupant esteems it highly. I recommend it to the farmers of the county; and that it be sown by itself, without any clover seed: for as the clover fails after the second year, naked spaces arc thereby left; and then the grass grows in tufts. instead of completely covering the ground. Orchard grass seed is at present dear; but when generally cultivated, it might become as cheap as the seed of herds grass.

A roller is deemed, in England, a necessary instrument of husbandry; and it is in use among some farmers in the United States. From my own experience I strongly recommend it. Mine may perhaps be thought a heavy one; but it is not too heavy. It is of solid white oak, about seven feet long, and twenty or more inches in diameter .-After small grains, or hay seed, are sown and harrowed in, rolling presses the earth close about them-drives in all the small stones-and in grass crops forms a smooth surface for the scythe. ground is in a proper condition for receiving the seed-neither too wet nor too dry,-that is, in a friable mouldering state-the surface of the ground mination of the seeds; on the contrary, they will ting just witen, in our common summers, the pas-

plough, after having been once subdued and well rowed, a multitude of grains will lie loose and naked on the surface, to be picked up by birds, or parched and ruined by the sun. Any stones on the ground too big to be pressed fully in by the roller, ought to be previously picked up and re-

7. Millet gives excellent hay; and the straw, after the seed is ripe and threshed out, furnishes a very palatable food for cattle-very far superior to any other straw. But to obtain a full crop of millet, to rise as high as three or four feet, the ground must be rich, and in fine tillage.

8. Every one knows that swamps, where there is a depth of soil, or mud, if laid dry by ditching, vield great crops of hay. It has been a practice with some farmers, besides ditching, to cover them with a considerable coat of gravel or sand : but if they admit of being thoroughly drained by ditching, I would never carry on gravel or sand-absolutely barren substances.

On this article, I again refer to Capt. Nichols. He confines himself to ditching; and has rendered his swamps dry enough to yield great crops of herds grass hay. But he takes care, every year, after his hay harvest, to cleanse his ditches, that the water may run off freely; otherwise its current would be obstructed by the grass which springs up in them-especially in the small ditches.

9. Many years ago I became satisfied that the hilling of Indian corn was at least useless; I was rather inclined to think it injurious. The roots, if not interrupted, will spread from hill to hill; but by hilling, the loose soil is scraped from the intervals, and heaped up about the stems of the plants. Doubtless the roots, after this, will endeavor, by new shoots, to regain their natural depth; but for this end they must encounter harder ground, and so be checked.

In Pennsylvania, it is a common practice to plant corn in continued rows, with intervals of about five feet between the rows, to admit of a more free cultivation with the plough and harrow; while the plants are at small distances in the rows. At the last dressing, the surface of the ground is left level. One acre laid off to be cultivated in hills four feet apart, would give 2700 hills ;, and with four plants in a hill, the whole number would be ten thousand eight hundred .-An acre laid off in rows five feet apart, and set with two plants at every eighteen inches distance, would give 11,600 plants-that is, 800 plants more than the acre with hills.

For the neat culture of Indian corn, the grains when dropped should be regularly arranged; but as commonly dropped, many grains are scattered, and in that situation grow up-to be afterwards torn away by the plough and corn harrow; or, to save them, balks are left, which require more labor with the hoe. Last year, visiting a farm a few miles from Philadelphia, I there saw a tin tube about three feet and a half long, with the ton flairing or spreading a little like a trumpet; which being moved from spot to spot, the corn was dropped through it, and laid just where it was wanted, with perfect regularity.

The great value of Indian corn stalks, in their green state, for feeding cattle, milch cows especially, I have formerly mentioned. That which is will not be pressed so hard as to prevent the ger- planted early, for this use, will be ready for cutspring and take root more successfully. If small tures begin to fail. Land that would yield fifty moist grounds-too moist to be broken up by the grain, as wheat, barley, or oats, are merely har-bushels of ripe corn to the acre, if cut close to the

time I suppose it has attained its highest growth) would give ten tons of the green fodder, of which of a day or two conducts it to the proper place. 75 lbs. would give a full daily supply, for a common sized cow, if she ate nothing clse; and at this rate, one neat ton (now taken at 2000 lbs.) would keep four cows two months: but if they gleaned half their food at pasture, the ten tons would keep eight cows in full milk, for two months-say August and September. But to have this fodder through that time, in its green and most juicy state, it should be planted at different times: so that the latest planted should attain its proper growth by the middle of September, and continue till the frost, which is frequent at the close of that month, or the early part of October. Where the corn is intended to stand for a ripe crop of grain, the green tops may be cut for green fodder, as soon as the fine dust (the farina) falls from the tassels on the silk of the ears; for every thread of that silk is attached to a grain of corn in the ear, and is the medium of impregnation. Without that dust so applied, there would be a cob and husks for the several grains, but no meal.

10. I have two or three observations to make respecting milch cows. Every farmer knows that they sometimes slink their calves; and it is said that a miscarriage once occurring, is likely to be repeated. This has happened to a very promising heifer of my own. When near two years and a half old, well grown, (as big as cows in general, though of our , native breed)-in full health, and fleshy even to fatness, she slunk her calf, which was so young as to be destitute of hair. However, she was regularly milked, twice a day, giving at first only half a pint at a milking : but her bag and teats gradually increased in size; and her milk, from half a pint to two quarts at a milking. Having taken bull she continued to give four quarts of milk daily; at the same time laying on so much additional flesh and fat that she would have made fat beef. In this healthy and active condition, at the end of six months and a half from the time she took the bull, she dropped another dead calf-large for the time, and covered with hair. Being milked as usual, she continued to give about four quarts a day, for a few days, and then rapidly increased the quantity to seven quarts a day. Her pasture was good. The milk all the time was perfectly sweet-not in the least changed by calving. She continued well and active, and retained her fat and flesh. I was a little concerned about her cleaning the discharge of the secuudine, or after-birth-but this came away by degrees.

Cases of this kind may be well known among farmers: but I have mentioned the matter for the information of some who may be as destitute of experience as myself.

I take this occasion further to notice the cleaning, or after-birth, about which I have understood that different opinions have been entertained .-Some have thought that it should be carefully removed, and not suffered to be eaten by the cow that has just dropped a calf. For myself, while living on my farm, I chose that my cows should be allowed to follow nature, and eat their cleaning. It is evidently an instinct affecting them at that particular time, as really as the instinct of the calf, as soon as it is licked dry, and can rise and walk, prompts it to seek for the teats of its dam. It appears to know that they are under her belly, but ally use now about two bushels on an acre, for to a bushel of grain.

ground at the time the ears are well set (at which legs; and accordingly it seeks for them sometimes between the fore legs-until the experience

Whether the cleaning eaten by the newly calved cow operates as a salutary article of food, or as a medicine, I am entirely satisfied that it should be considered as a specific, exactly adapted to her condition

the Society; recommending a perseverance in its Judge of its quality, but it often has streaks of object; being fully persuaded of its utility thus sand in it, which are worthless, and frequently the far; and that by the attention of practical farmers, and their mutual, free communications, its but little. One method of trying its quality, is to usefulness may be continued and increased. Sept. 25, 1828.

From the American Sentinel.

GYPSUM, OR PLASTER OF PARIS.

History informs us that the utility of gypsum to grass, was first discovered in Germany, by a laborer at the gypsum quarry, who, passing across a meadow after his work, to shorten the distance home, discovered in the course of the season the luxuriance of the grass where he had travelled. and imagining that the dust of gypsum from his clothes must have been the cause, tried the experiment, and the result answered his expecta-

Some time after, a keg of it was sent to America, to Mr Jacob Barge, of Philadelphia, and soon come into use, in that part of Pennsylvania; where they value it very highly, and even suppose the hay produced by it, is better.

It is said, however, that gypsum will not promote vegetation much, near the ocean, or in any place where it can be decompounded with sea salt-which I fully believe, having been informed of the fact by a number of gentlemen from different States. How far from the sea the air will prevent the fertilizing effects of it, I have never heard stated, but can say that it is very serviceable on my farm, which is about 17 miles from it is well to use a little dung even where plaster Long Island Sound, on a straight line.

I will mention some of my experience of its utility. In May, 1796, I sowed some gypsum which was imported from France, on grass land of different kinds, viz. on loamy, sandy, gravel, and wet clay soil. Its effects were very visible in every case, except the last mentioned, where it apply the plaster immediately after the first hoedid but little good. I also applied it on Indian ing, but it ought to be mixed also with the seed corn, wheat, rye, barley, oats, flax, potatoes, &c.

rows were left without it, which collectively did and stirring in a little tar, at the rate of about half not produce more than one row on either side: owing very much to the grub having left the corn where the gypsum had been applied, and destroyed the other. Where the gypsum was put on the flax, the difference was manifest, for it was some inches higher than the other; and there was a plain difference in the potatoes.

The wheat, rye, barley, and oats, did not appear to be much benefited, although the grass was visibly better for some years after the crops take a cask of water, unless a spring or a brook is were taken off.

induced me to use it freely, and as soon as con- tub of water, and after it has soaked a little time. venient, I procured ten tons from Nova Scotia, and raise the basket, and put a stick or two across the sowed about eight of it in May and June follow- tub under the basket, and it will soon drain; then ing, at the rate of about three bushels per acre; mix it in the dry tub, with a sufficient quantity of and have used some every year since, but gener- plaster to make it sow well-perhaps 6 or S qts not whether they are between the forc or the hind grass land, and about one bushel on corn, where it | Clover seed, if clean from the hull, should by all

is applied to the hills. I have not generally sown the same land with it more than once in six or eight years, neither do I think it necessary to sow it annually, as some do; for its effects are frequently visible five or six years. The plaster from Nova Scotia is not all equally good, neither do I think any of it equal to that which is imported; but it is obtained cheaper, and therefore I gener-With these observations I must take leave of ally use it. The color is no certain criterion to ton of the rock is offered for sale, but it is worth put a quantity (pulverised) into a dry pot over the fire, and if it boils like hasty pudding, it is good; if the ebullition is small, it is but indifferent; and if it remains an inert mass, it is worthless. I like to have it ground fine, in fair weather, and used soon after grinding, lest it become lumpy, and need mashing with a hoe, or running through the mill again. It is best to sow it in still weather, that it may not blow away. I have sown it in all seasons except winter, merely for experiment, and have found it useful, but have sown it principally in May and June. On pasture land it may be sown at any time when convenient : but on mowing land it may be as well to sow it directly after the hay is off, if the time can be spared to do it; for it serves to collect moisture, and keeps the land from being parched by the intense heat of the sun, which is frequently the case at that season of the year. It does the most good in dry seasons, and on land which has recently been laid down, with clover, and herds grass; but if intended for mowing, it ought not to be sown the first year, lest the clover lodge down; the second year the herds grass will grow more abundantly and support it.

It is well to sow it on mowing land even if it is old sward, although its effects may not be very visible till one or two years after sowing, neither will it make poor land produce luxuriantly; and has been used; but I think manure is worth two or three times as much when ploughed in shallow, as when spread on the surface, unless it be fine, and spread just before a rain, in the season of vegetation. Plaster is rather the best when used as a top dressing. On Indian corn it is best to before it is planted, after having wet it in tar wa-Where the gypsum was put on the corn, five ter, which may be made by warming the water a gill to six or eight quarts, then put in the corn. and stir it that the tar may adhere to each kernel; then mix it with plaster in a dry vessel, as you plant it. The tar is used to prevent the birds and insects from destroying the corn, and to cause a sufficient quantity of plaster to adhere to the kernels without sticking them together.

It is also useful to mix plaster with all kinds of grain, before it is sown. My method has been to near, with two tubs and tight basket into the field: The utility of gypsum appearing so manifest, put some grain into the basket, and set it into a

on the surface without covering.

Much more might be added if time would aland dare not venture to try it.

A FARMER.

The High Cranberry.-Few people seem to be plentifully in the marshes and swamps around us, trunk." yielding rich clusters of very bandsome fruit, a delicious tart, may be cultivated with ease and success in our gardens and shrubberies. Without knowing that the attempt had ever been made, I tried last spring, with some half a dozen shrubs, from Saratoga county, all of which bore the transplanting very well, for they lived, grew as vigorously as most vegetables do the first year, and some of them bore fine bunches of fruit. The twigs taken off, put out as cuttings, also took, which shows with what great facility we may stock our gardens with cranberries .- Rochester Advertiser.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 10, 1829.

DISEASED PEAR TREES.

Extract of a letter from a gentleman in Northampton, Mass. to the Editor of the New England Farmer, dated June 25, 1829.

"My pear trees are most severely attacked this season with the blight, or what I call vegetable gangrene, also with the honey dew. I saw in an English publication "a cure for the American blight on pear trees," viz. " lime water and spirits of turpentine." No directions as to proportions, time, or manner of applying it. I am trying a variety of experiments, but am almost discouraged. The blight is no respector of soil, aspect, age, vigor, or kind of fruit. It has attacked the Seekle, Brown Beurre, Early Catharine, Messire Jean, Winter and Summer Chaumontelle, Petit Muscat, Bartlett, Hardenpont de Printems, Beurre Knox, Green Satin, German Muscat, &c. The last and the Chaumontelle, most fatally. Early this month they were perfectly sound and in vigorous growth. both well set with fruit-they were about from 15 to 20 feet high, and not a defective spot on them. In two days they were wilted, and almost charred, ten feet down from the top. The fruit that was perfectly plump and sound, was in fortyeight hours shrivelled up like a dried app'e .-One I headed down to the sound parts, and engrafted with the Bartlett scions."

Remarks by the Editor .- " Blight," says Loudon, " is a common term for injuries received by the vegetable kingdom when in a state of growth, which cannot be referred to any obvious or certain cause, and coming suddenly is said to give them the appearance of being blighted, or blasted." Indeed the term blight, applied to vegetables, scarcely gives us a more definite idea of any specific disease than the term death when applied to animals. The pear trees of the respectable cultivator, who favored us with the above, are probably blighted by a disease similar to that described by his Excellency Gov. Lincoln, in a communication for the N. E. Farmer, published may be on their guard, lest they may be disapvol. v. p. I. In this Gov. Lincoln observed as pointed.

means be managed as above mentioned, if sown follows, "I send you two small branches for pear trees] which forty-eight hours since, were green and vegetating, now dry and shrivelled as from low it, but enough may have already been said to a year's decay. The disease, so far as I have weary the patience of many of your readers who had opportunity to notice it, appears in the sudhave seen it used with success for 25 or 30 years, den discoloration of the leaf, which becomes sometimes uniformly brown, like the effect of the winter's frost, and in other instances, black in spots, or parts, having the appearance of being stained with ink, or some dark liquid-and the aware that this shrub, or small tree, which grows decay of the limb is rapidly downward to the use of the apparatus will be given on application

> The subject was much discussed in that and subsequent Nos. of the New England Farmer .-By some the disorder was attributed to an insect, called Scolytus Puri; by others to too much manure; others called the disease fire blight, and attributed it to a stroke of the sun, &e. &c. The only remedy, which, so far as we know, has been discovered for this complaint is to cut away the diseased parts of the tree at some distance below any appearance of disease as speedily as possible, and make use of some of the usual applications, such as grafting cement, Forsyth's composition, &c. to heal the wounds, where the branches are cut away.

> Uniformity in the Names of Fruits .- At a meeting of the Massachusetts Horticultural Society. June 20, John Lowell, Samuel G. Perkins, and SAMUEL DOWNER, were chosen a Committee to facilitate an interchange of fruits, the ensuing autumn, with the Philadelphia, New York, and Albany Horticultural Societies, and others, for the purpose of establishing their synonymes. There is no greater obstacle to the cultivation of fruits, than the great confusion in their names that now prevails. It is no uncommon occurrence for a person in ordering trees from different nurseries. either in Europe, or the United States, to find, after waiting for his trees to come into bearing, that he has the same fruit under three or four different names, or to receive some kind of which he already has a sufficient number. The different Horticultural Societies in Flanders, London, and Paris, are attempting to remedy this evil, and have already accomplished much, although their facilities for the interchange of fruits are not so great as are possessed in the United States.

> Specimens of fruit can be sent to the Society's Hall, No. 52 North Market Street, care of J. B. RUSSELL.

SINCLAIR BEET.

MR J. B. RUSSELL .- A few weeks past I received at one of the meetings of the Horticultural Society, a paper of the Sinclair beet seed, which I understood was recommended as a superior stock beet, therefore imagining it was valuable as yielding a large crop for animals. Within a few days I have conversed with two experienced English gardeners, neither of them more than two years from England; one of whom is confident that the Sinclair beet produces a very small root, and is only of use for the stalk or stem part of the leaf, which by being planted pretty thick, is very white and delicate, being boiled for the table. The other gives the same description of a beet as being introduced clair.

I merely give this hint, that those persons who are cultivating it, and expecting it as a root crop, Yours, &c. A SÜBSCRIBER.

MANUFACTURING SILK.

The subscriber having invented a very useful and simple machine for reeling and spooling silk. is desirous of introducing the same into general use, and has deposited one of the machines for inspection at the Hall of the Horticultural Society, 52 North Market street, Boston; where persons who are desirous of engaging in the manufacturing of silk, are respectfully invited to call and examine the machine. All necessary information for the at the Agricultural Warehouse, or to the inventer, at her residence in Lexington, near Monroe's Tavern.

Persons wishing for instruction in the art of spinning, which is considered as a separate branch from that of spooling and reeling the raw silk. may be fully instructed in this very useful branch of industry in the course of a week or ten days. on application to the subscriber as above.

FRANCES JONES.

From the Transactions of the Horticultural Society.

On a method of growing Asparagus in single rows, as practised by Mr WALTER DICKSON, of Redbraes, near Edinbugh. By Mr Andrew Dickson, F. H. S. of Edinburgh.

(From a letter to the Secretary.)

Sir-Mr Dickson's method of growing asparagus in single rows, of which you have requested an account, is so simple, that little explanation will be required. It occurred to him that planting asparagus in single rows, particularly in the soil of his garden, (which is a light black earth upon a subsoil of sand,) might answer much better than in beds, as it would enable him to introduce manure to the roots, by pointing it in between the rows with the spade. He had observed that the usual mode of dressing asparagus beds by a covering of dung in winter on the surface, was apt to produce canker, and that consequently many of the plants in the beds came up sickly and weak in the spring, and ultimately decayed during the summer. The first plantation he made in single rows was in our Leith Walk Nursery, upwards of twenty-five year's ago, and this yet retains its vigor and produces fine heads. This, I think you did not see when you were at Edinburgh, otherwise you would have noticed he had erred in not giving sufficient room between the rows, which are only two and a half feet apart. The plantations he has since either made himself, or recommended to others to make, have been at three and a half feet distance row from row. The plants are planted at nine inches apart in the rows: the ground has no farther preparation previously to planting, than being dug or trenched to its full depth, and well manured with rotten cow dung. The young plantation you saw at Redbraes, has only been made two years, and was so strong as to admit of being partially cut the second year .-Mr Dickson prefers planting in July to spring, and the seedlings of the preceding season. I venture to give it as my opinion, that the produce from two single rows, planted in the way described, will both in quantity and quality, (but particularly the from France, but did not hear it called Sin-last,) be found superior to three rows of equal length, planted in beds in the usual way; the facility with which the heads are cut are likewise in favor of the row system. I may further add that in our northern climate it is of moment that the plants should have all possible benefit of the

sun's rays, that the roots may be well rivened and prepared to shoot vigorously in the spring : and I need not point out to you that this will be better obtained by the plants growing in distant rows, than when they are crowded in beds in the usual 1 am, sir,

Your very humble servant. ANDREW DICKSON.

Hemp .- Mr Stephen Boyington, of Hinesburgh, in this county, planted last season one quart of hemp seed, after the fashion of planting broom corn, on less than one-fourth of an acre of land. The crop produced twenty bushels of good clean hemp seed. One stalk at a fair distance from the ground, measured seven inches in circumference, and ten feet in length .- Northern Sent.

Recipe for the cure of an incipient cancer .- Take half a pound of Pipsisawa, by some called winter green; it resembles the chickaherry leaf except being notched on the edge-add one pound of the oil of olives, and simmer them together in an earthen vessel well glazed, till the leaves are crispy, then strain it off, and keep for use. With this anoint the part affected three times a day; also make a decoction of the same herb, of which let the patient drink a tea cup full morning and evening. N. B. Drink no strong liquor while using the above.

The foregoing article was communicated for publication by a respectable physician. - Brattleborough Reporter.

Spots on the Sun .- In looking through a telescope yesterday, we noticed at least a dozen opaque spots on the Sun's disc. They are generally small and a good deal scattered. It is a curious question, and one which is not fully decided, whether or not these spots have any connexion with the coolness of the season. In some of the coolest summers since the commencement of the present century, similar spots have been observed in considerable numbers, and some of them very large. N. Y. Jour. of Com.

How to make excellent Beer .- Take 20 drops each of Oil of Spruce, Sassafras, and Wintergreen -mix these thoroughly with 11 pints melassesthen add 3 quarts hot water-stir them well together-after which add 1 pint of yeast, and 2 gallons of cold water. Shake the whole together, and let it stand 12 hours-then bottle it, and in three days it will be fit for use.

The above recipe is highly approved by many families in this vicinity, and deserves to be more extensively known .- Hamp. Gaz.

Punishment of Immodesty .- A Chinese Judge in passing through a narrow street, saw a poor woman with her breast exposed, suckling a child, at the door. For this want of modesty he ordered her immediately 30 slaps ou the face; and her husband 40 blows for not having taught his wife better manners! Such are the doings even of good men under a despotism.

The charter of the East India Company will expire in 1834. The renewal of these charters is likely to give rise to much discussion in Eng-

MISCELLANIES.

The following beautiful Hymn, written by the Rev. Mr PIER PONT, of Boston, was sung on the 4th inst. at the public exercises of the American Colonization Society, whose object is the Abolition of African Slavery.

> With thy pure dews and rains, Wash out, O God, the stains From Afric's shore; And, while her palm trees bud, Let not her children's blood With her broad Niger's flood Be mingled more!

Quench, righteous God, the thirst That Congo's sons hath cursed-The thirst for gold! Shall not thy thunders speak Where Mammon's altars reek, Where maids and matrons shrick, Bound, bleeding, sold!

Hear'st thou, O God, those chains, Clanking on Freedom's plains, By Christians wrought! Them, who those chains have wern, Christians from home have torn. Christians have hither borne, Christians have bought!

Cast down, great God, the fanes That, to uphallowed gains, Round us have risen-Temples, whose priesthood pore Moses and Jesus o'er, Then bolt the black man's door, The poor man's prison!

Wilt thou not, Lord, at last, From thine own image, cast Away all cords, But that of love, which brings Man, from his wanderings, Back to the King of kings. The Lord of lords!

From the Baltimore Weekly Magazine.

BAKED BEANS.

Oh! how my heart sighs for my own native land, Where potatoes, and squashes, and cucumbers grow; Where cheer and good welcome are always at hand, And custards, and pumpkin pies smoke in a row; Where pudding the visage of hunger serenes. And, what is far better, the pot of baked beans.

Let Maryland hoast of her dainties profuse, Her large water-melans and canteleupes fine, Her turtles, and oysters, and terrapin stews. And soft crabs high zested with brandy and wine; Ah! neither my heart from my native land weans, Where smokes on the table the pot of baked beans,

The pot of baked beans! with what pleasure I view it. Well season'd, well pork'd, by some rasy-faced dame; And when from the glowing hot oven she drew it. Well crisp'd, and well brown'd to the table it came. O give me my country, the land of my teens, Of the plump Indian pudding and pot of baked beans.

The pot of baked beaus! ah! the muse is too frail, Its taste to descant or its virtues to tell; But look at the sons of New England so hale, And her daughters so rosy-'i will teach thee full well: Like me it will teach thee to sigh for the means Of health and of rapture-the pot of baked beans.

A YANKEE.

Economy.—The acquisition of wealth appears to be the prevailing desire amongst men, and the pursuit is laudable if it has justice for its foundation. Blackstone says a property founded on injustice cannot be of long duration. There is no honest way of acquiring wealth but by industry and economy. All know how to be industrious. but it requires information and experience to understand well the practice of economy, which is the operation of knowledge in regulating business according to time and circumstances. Whoever makes use of all his time according to the best of his abilities, is fulfilling the purpose of his creation, and doing all that virtue requires of him. A farmer should arrange everything throughout his family and farm, according to justice and equity; every one should have their allotted portion of the business to do, in order and regularity. When justice is known to be the basis on which the whole business of a farm is conducted, each one will do his duty with cheerfulness and expedition; for justice, like salt, preserves everything about it. The ladics of this great republic are respectfully solicited to use their influence in promoting industry, frugality, and economy, in their domestic vocations-their example and advice have great influence in society—the fashions, customs, and manners of a country are very much at their control-it generally falls to their lot to have the care of children, and to train them up to virtuous industry, and teach them the rudiments of knowledge, and duties of great weight and importance in society.

Early rising, temperance in eating, drinking, conversation and labor, are all necessary requisites towards completing an economical life. Early rising produces fine spirits, encourages industry, and gives many a leisure hour for mental improvement, which is of more value than any other acquisition. Temperance should be observed as the indispensable criterion in all our actions; it promotes health of body, sanity of mind, and long life-it shields us from many loathsome temptations, in which gluttony, drunkenness, and other excesses, inevitably involve us.

The faculty of speech is a divine power conferred on man, which enables him to pursue a progressive improvement of the mind towards perfection; of course, language should be cultivated and preserved in purity.

Moderate labor strengthens the constitution, regulates the circulation of the blood, and promotes a proper tone in the system-excessive labor debilitates the system and shortens life.

By following the rules of economy, a young man in any circumstance in life, may find time and means to acquire knowledge and improve his understanding. Every hour when past is gone forever, and all the gold of earth cannot redeem it; if well spent, it stands in our favor; but if ill spent, it stands against us; and whatever the understanding impresses on the memory, must remain there as long as the mind continues to exist. Our good actions are always commending and encouraging us. This shows the necessity of making use of all the vacant time in the acquisition of useful knowledge. Early acquirements are of great importance. Ten minutes well spent, at fifteen years old, are worth more than a whole day would he at seventy. Little do young people know the value of the golden hours of youth, or know the value of the golden hours of youth, or of customers. Or ders for principle to meet the wishes they would be more cautious how they throw them at the Agricultural Warehouse No. 52 North Market Street. laway; for bad habits are easily acquired; but ing made in advance.

nothing in nature is more difficult than to forsake them. All our well spent hours shine like diamonds in our lives, and the mind looks back on them with divine pleasure. A plough boy by a judicious employment of time, might make the tail of his plough the school of wisdom; and a collegian. by an injudicious employment of time, might make his college a school of vice and mental debasement. It matters not what our occupation is, if we make the proper use of time; for industry, judiciously applied, is the philosopher's stone, so ardently sought after by ancient sages in vain.-The farmer, of all men, has the fairest opportunity of acquiring knowledge in its original purityhis business calls him through fields, woods, and vales, and gives him acquaintance with the nature of things. There he can read the unveiled truth. written in the book of creation, by the hand of God, without an interpreter, and no one will have the hardihood to tell him it is not true; because it is composed of self-evident facts, containing the principles of all the sciences, and the duties of life. A ploughman wishing to become acquainted with any particular branch of knowledge, may carry a book in his pocket, containing a theory of what he would wish to learn, and read a few sentences occasionally to speculate on, while he is following his plough, without interrupting the business of the day. This method of acquiring knowledge can be put in practice by the inhabitants of cities, as well as those of the country: but not with equal success,-for want of a rural scenery they would fail, particularly in the art of poetry. There have been but few good poets without being acquainted with a country life .-Phil. Eve. Post.

Tall Meadow Oat Grass Seed.

This day received at the New England Farmer Seed Store, 52 North Market street, 20 bushels of Tall Meadow Oat Grass Seed, at 32,50 per bushel.

Also, White Mulberry Seed, 50 ets per ounce, Luceme,

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HORSE RADISH FOR PRESERVING MILK. MR FESSENDEN-In the New England Farmer of the 12th of June, 1829, you have extracted from the American Farmer " A method of preventing milk from becoming sour." Will you inform your readers what the wild horse radish is -in what it differs from the cultivated-how it is known-where it can be obtained, and whether it is the juice expressed from the leaves, or the root which is to be used? as all this information is necessary to enable the unlearned to try the ex-AN OBSERVER.

Remarks by the Editor .- The article alluded to is as follows: Method of preventing milk from turning sour .- Put a spoonful of wild horse radish into a dish of milk; the milk may then be preserved sweet, either in the open air, or in a cellar, for several days, while such as has not been so guarded will become sour .- Am. Farmer,

We know nothing by experiment relative to this prescription; but know that substances which are pungent, or acrid-are useful in preventing putrefaction, and of course will prevent or retard the acetous (or sour) fermentation, which is the first step in the process of putrescence. We know of but one species of horse radish, and this is called by botanists Cochlearia Armoracia, and is too well known to need description. The garden radish, from the horse radish. We cannot say by what process the horse radish is prepared for infusion with the milk, which it is wished to preserve, but presume that the best method would be scraping the root in shreds, as we would for cating it as a condiment with roast beef. We know nothing of the quantity requisite, but if it will answer a useful purpose, we suppose it will not be necessary to use enough to make any very perceptible difference in the taste of the milk. An experiment or two would test the value of this article for the purpose proposed. An English writer says that " an infusion of horse radish in cold milk makes one of the best and safest cosmetics;" but we have never known it used for that purpose, and presume that American ladi need no beautifying lotions of that or any other description, to add by art to charms which nature has bestowed.

Dorchester, July 14, 1829.

From the Pomological Magazine-

THE CAPIAUMONT PEAR.

Capiaumont. Hort. Trans. vol. v. p. 406. Beurré de Capiaumont, Hort.Soc. Fruit Cat. p. 159.

This is one of the best of the varieties raised in Flanders during the period when so large an accession was made to the lists of cultivated fruits in that country. It is recorded to have owed its origin to a M. Capiaumont, of Mons. The first specimens which were seen in this country, came to the Horticultural Society in 1820, from M. MR EDITOR-I have lately looked over the Parmentier, of English, and M. Dumortier-Rut-London Pomological Magazine, and examined the teau, of Tournay. They excited much admiration drawings of the new fruits, particularly the new at the time, and measures were immediately taken varieties of pears, apples, and plums, which will to secure the variety for this country. Unfortusoon be introduced in our gardens and nurseries. nately, however, the cuttings which were sent over These we must eventually depend upon for our were so much mixed, or so carelessly labelled, stock fruit, to supply the place of the St Michael, that a very small proportion of them proved to be St Germain, and others that are rapidly disap- of the true kind. In their room were received pearing. I make a request of you, which will, I the Beurré Rance, the Colmar Jaminette, and even trust, be acceptable to many of your readers; to the Napoleon. The true kind has always been publish in your paper a description of these new sold by Mr Richard Williams, of Turnham Green; and tine varieties, with a figure of the same, to and from trees procured from his Nursery, and give a correct idea of their usual size. FOR TO .. NEW ENGLAND DARMER.

FRENCH PLANTS.

Ma Fassenran-In compliance with a notice in your last paper, I send the following as the results of some purchases made from Messrs Folix. Freres & Co. last spring. The first column contains the names of the plants from their catalogue ; the second what they have turned out.

1. The fine red Muss hose. Our common Damask. 2. The Panachee, or Streaked 3. Id. the Violette Moss Rose. do 4. The White Our common White. 5. The Yellow 6. The Ville Morai Not flowenid Common Blash. -----: sem flowered. S. The huge yellow white bot-Common Damask temed Rose.

GREVILLE ROSE.

From a paragraph in the New York Post, it would seem that this rose, of which we have had such a wonderful account in the catalogues of some New York Nurscrymen, and other publications, has "fully realized the expectations of amateurs,"

Three plants have flowered in this vicinity, and, it is true, presented some slight shades of difference in the tints, but by no means so many as the common Multiflora, arising, it is probable, merely from different exposures to the sun, a very common circumstance, we believe, in all roses -The flowers were in small clusters, the greatest number on any plant being seventeen (not "above a hundred," as happened in New York.) The Greville rose was propagated during the last season in great numbers, but every cultivator in this vicinity has come to the conclusion that it is not worth the trouble. It has not proved any way superior to the common wild rose that adorns our hedges and road sides, and is surpassed by the Sweet Briar.

Brookline, July 10, 1829.

FOR THE NEW ENGLAND FARMER.

NATIVE GRAPE.

MR FISSENDEN-When in Boston a few weeks since, a number of our horticultural friends were desirous of knowing whether we had any native fruits with us which were truly valuable. Feelling anxious, if in my power, to aid their laudable exertions in searching out and propagating all the native fruits of real worth. I recollected a native grape which with us is considered well worthy extensive cultivation, of which I promised to give them some definite information. Since my return I have seen the owner of the original vine in our county (Mr B. D. Buck, of Weathersfield) who gave me the following notice of it.

The original vine was found on a small creek, in the interior of Pennsylvania; was discovered and cultivated by the Germans who inhabited that part of the country, and who valued it very highly. Mr Buck has been in possession of his vine about ten years. He procured it from Albany, of the person who brought it from Pennsylvania. The fruit is purple, close set, cluster not very large, form nearer round than oval, pulp about the same as the Isabella, never sheds its fruit, and is in eating from eight to ten weeks, a constant and great bearer; it has been judged to have had upon it at a single time fifteen bushels. It has never been trimmed, and is now in very fine order, heavily laden with fruit. He calls it the "Columbian," we the "Buck Grape." I hope it will be acknowledged worthy of one name by the Massachusetts Horticultural Society, after testing the sample which I shall endeavor to forward them when in season. If they have not now the same kind, I will forward to their Hall a quantity of roots or slips, should it be their wish.

With sentiments of respect,

I remain, yours, E. W. BULL.

Hartford, Con., July 6, 1829.

FOR THE NEW ENGLAND FARMER.

FINE STOCK.

MR FESSENDEN-Observing in your 19th number of the N. E. Farmer, an account of a remarkable cow and calf belonging to Mr STICKNEY, of Rowley, I take the liberty of forwarding you the following statement of facts (which are also susceptible of proof) relative to a cow and calf belonging to my brother-in-law, Mr EDWARD HAR-

The cow is believed to be of common breed, red color, of large size, well proportioned, horns rather long and standing more upward than common: her udder extending forward, and more up between the legs than usual, but not dropping low. During the last summer her milk was at different times carefully and accurately measured, and found to be fully thirty-two quarts per day .-She had no feed but good pasture, and received no extraordinary care or attention, with the exception of milking her in the middle of the day, which is always necessary. She, this season, had a ball calf (sired by a three-fourths Short Horned Durham) which at four weeks old weighed two hundred pounds; it was then sold to a farmer in the neighborhood, who had seen it weighed, at a certain sum per lb. to be taken from the cow and weighed in one week, at which time it was found to have increased thirty weight, or four and a quarter pounds per day.

Respectfully yours. J. I. SPENCER. Moorestown, (N. J.) July 6, 1829.

Two tea spoonfuls of mustard from the mustard pot, mixed with warm water, and swallowed, instantly operates as an emetic, and is recommendFrom the Centinel.

PISTAREENS.

all the English and United States coins, at the se- empire. rious loss to both governments, of the expense of the coinage. Can you inform your readers what has become of our five cent silver coins? The evil will cease, as soen as our government shall restrain in our territories, the circulation of all Spanish silver coins, of less value than quarters of dollars, at a higher value than our own coins. It is an important fact that the unrestrained circulation in the United States, of the Spanish eighths and sixteenths of dollars, has obstructed, retarded, and prevented the full operation of the United States laws regulating the currency. CANTAB.

July 8, 1829.

From the New York Farmer.

On the Culture and Manufacture of Tea, communicated by an American gentleman, for the N. Y. Farmer and Horticultural Repository.

You ask of me some notices of the state of herticulture in Brazil. It would be as easy to furnish you with a sketch of the notions upon political economy entertained by the Patagonians, or an elaborate essay upon the state of the fine arts among the Hottentots. A people whorknow nothing of butter except as it comes to them salted from Ireland, and who derive all their potatoes from the same country, cannot be supposed to have made any very brilliant discoveries in farming or horticulture. It is accordingly of the simplest kind. They get as much from the earth as can be obtained with the least possible trouble, and smile incredulensly if you tell them of the importance of paying more attention to the introduction and culture of foreign vegetables. Of late years the numerous French, English, and American residents have shown them the possibility of raising these vegetables, and one may now see in the markets occasionally, cabbages, turnips, and even sallad! There is, however, a Royal Botanie Garden, formerly under the direction of a skillful German, but now going rapidly to decay under the slothful management of a Portuguese Carmelite Friar. As this garden has obtained some celebrity in books of travels, I will pounds annually; and this I think is still within furnish you with a few remarks which I made when I visited it in 1826-7. And as the most interesting feature of this garden was the extensive eies T. viridis, or green tea. tea plantations, I herewith furnish you with such notes as relate more immediately to that sub-

> The most curious eircumstance in relation to tea is the ease with which it is prepared for market. I witnessed the whole operation and can therefore speak confidently on the subject.

The gathered leaves are exposed to the air for a few hours, until they begin to wilt, as it is popularly called. They are then thrown into circular pans set in brick work, under which is a moderate fire. These pans are of iron, four feet in diameter and about a foot deep; the leaves are stirred briskly about in these pans for ten minutes or longer, according to the judgment of the opcrator, when they are thrown out to another person who is ready to receive them. This person holds before him a flat wicker, or willow frame, about two feet wide and four feet in length, slightly inclined toward the floor. He strews the leaves upon this frame and lays over it another frame of the same dimensions and materials. moved rapidly to and fro for soveral minutes, and by this simple operation the leaves are curled up and fall at the lower end of the frame into baskets conveniently placed for their reception. This part of the process surprised me exceedingly, for all travellers assert that every leaf is rolled up separately by hand, and I have even heard it maintained that it is only the small and delicate hand of a Chinese that can be advantageously employed for this purpose. Those leaves from which the moisture has not been sufficiently expelled. remain adhering to the frame, are of course not affected by the process, and are returned again to the heated pans. When a sufficient quantity of the curled leaves has been obtained, they are placed for a short period over a strong fire to drive off any remaining moisture, and are then put up into papers or chests for immediate use.

I inquired how much tea could be obtained ananally from a single shrub, but no one appeared to have ever thought upon the subject; they were unable at least to make even a tolerable guess about it. Judging from the size of the plant and the number of times it is stripped, I should conjec-

tion and cultivation of the tea plant.

There is perhaps no country in the world whose climate resembles our own so much as that of raising of tea. We are accustomed to see it occanorth latitude; north easterly winds prevail and logical table to which I have been able to refer, bring with them the same kind of weather which we experience in the United States. From a meteorological table derived from Dr Lynn, who accompanied the English embassy in their travels showed a continual and regular decrease of temfrom the southern to the northern extremity of China, it appears that during the months of September. October, and November, the thermometer China; and we have already seen what a striking varied between 45 and 75 deg. though it was resemblance there is between that climate and rarely as low or as high as either of these points. There were frequent and sudden changes of temperature, amounting to 10, or 15, and even 20 degrees within the twenty-four hours. Our Dr Rush had long ago pointed out in some of his philosophical essays the very great resemblance in these particulars between the climate of China and that of the United States, and hence we may conclude that there is nothing in our climate to prevent the successful cultivation of the tea plant.

Dr Abel mentions that the green tea district is embraced between the 29th and 31st degrees, which correspond to the northern parts of Georgia, Alabama, and Mississippi.

The black tea districts are confined within narrower limits, that is to say, between the 27th and 28th degrees of north latitude. Florida, Louisiana, and Texas would correspond with this in the United States.

But as the temperature of those States which mountains is much higher than in corresponding that the tea plant could be successfully cultivated Journal. in Tennessee, Kentucky, and Illinois. It must, however, be remembered that these limits assigned by Dr Abel to the tea districts in China, are not fixed and permanent. Circumstances which the proverbially cautions policy of the Chinese do not permit us to unveil, may, perhaps, have confined its more general cultivation to a district of not more than 250 miles in extent. It is found, done, especially upon timber that is cross grained. however, growing in the latitude of 32 deg., cor. The inventor of this machine is Mr Daniel N. responding nearly to that of Savannah, in Georgia, Smith, of Warwick, Mass. ket the crop of a hundred acres; and the most St Helena, at the Cape of Good Hope, and as we examination we found it to be of very simple con-

Having thus shown that there is nothing in its geographical situation opposed to its introduction actness. It is constructed in such a manner that into the United States, let us examine the nature its operation may be produced by hand, horse, and composition of the soil upon which it is most extensively raised in China,

The intelligent author above quoted, states that from the Chinese market, it may well be worth it appeared to be most generally cultivated on our while to inquire whether we cannot render sides of mountains, where there can be but little accumulation of vegetable mould. The plantation at Rio de Janeiro, was on a level plain, comance with the "metaphysics of commerce," as po- posed of loose sand, resulting from the decompolitical economy has been called, but I should cer- sition of granitic rocks. As far as the tea districts tainly think, that our tea trade cannot be very of China have been examined, the rocks of the profitable to the country, as it is one in which country are found to consist of sandstone, slate, neither our staple commodities nor the products and granite. The result of all observations has of our manufacturing industry, are given in ex- clearly shown that for the successful cultivation of the tea plant, nothing more is required than a But let us examine whether our climate or soil meagre soil and a moderate temperature. Both offer any impediments to the successful introduc-, these requisites I believe may be found in our country; it only remains to mention one circumstance that may be supposed to be adverse to the China. This country extends with a medium sionally in our hot houses, and honce we might be breadth of 600 miles along the eastern sea; and led to conclude that it would not flourish in the is included between the 22d and 41st degrees of open air all the year round. The only meteoroshows that in the latter part of the month of November, the thermometer stood in the black tea district at 40, and the observations for that month, perature. We all know that ice and snow are familiar occurrences in the northern districts of our own. I conclude then that the tea plant might withstand even severe frosts; and I am not acquainted with any circumstance to oppose its introduction into the United States.

> Respectfully yours, Ĺ E. D

Reanimation of Frozen Fish .- In winter, the Canadian fishermen crect buts on the ice of the lakes and rivers, and, cutting a hole in the icc enclose it with a screen of straw, &c. to shelter then selves from the cold. Sitting inside the screen they sink their books through the hole made in the ice. Amongst other fish so caught, are perch in abundance. After hadling them up if thrown aside on the ice, they speedily become frozen quite hard. They then take them home and place them in water near a fire; in a short time they begin to exhibit symptoms of reanimation. The fins first quiver, the gills open, the lie to the west of the great Apalachian ridge of fish gradually turns itself on its belly, moves at first slowly about the basin, and at last completely latitudes on the sea coast, I confidently expect revives and swims briskly about.-E.in. N. Phil.

> various sizes, has recently been constructed, which in its operation executes work in oneeighth part of the time it can be performed by hand, and in a better manner than it is usually

struction, not liable to get out of order, and operates upon the timber with great facility and exwater, or steam power. House, and ship builders, machinists, cabmet makers, wheelwrights, &c., may use it to great advantage; and we recommend it to them as an admirable and important invention.

Mr Knowlton, who is the agent for Mr Smith, will probably attend to any communication that may be addressed to him on the subject .- Pittsfield . Irgus.

Malt Liquors a Preventive of Fevers .- It is a curious fact, and one which is worthy of investigation by medical men, that persons who are in the habit of drinking largely of malt liquors, are rarely known to be siezed with typhus, or other low fevers, whatever other effects these liquors may have upon the constitution. In corroboration of this fact, we have been assured by those whose opportunities for observation have been extensive, that there is not an instance known of a brewer's servant being entered as a patient, under these diseases in any of the public hospitals .- York (Eng.)

Important to Gardeners .- On every square rod planted with cucumbers, but a piece of a board flat on the ground, to preserve your plants from a striped bug, which some seasons is very destructive. This simple experiment may seem to be novel and ineffectual: but the secret of the matter is, the board forms a shelter for a toad, which hops from under the eover at night and destroys the bugs, and during the day time may be found by turning over the board. Should any one have doubts on the subject, he can easily my the experiment .- Saratona Sent.

To make kitchen vegetables tender .- When peas, French beans, and similar productions do not boil easily, it has usually been imputed to the coolness of the season, or to the rains. This popular notion is erroneous. The difficulty of boiling them soft arises from a superabundant quantity of gypsum imbibed during their growth. To correct this, throw a small quantity of subcarbonate of soda [common soda of the shops] into the pot along with the vegetables, the carbonic acid of which will sieze upon the lime in the gypsum, and free the legumes from its influence. - Bulletin des Sciences.

Wonderful Phenomenon .- On the afternoon of the 9th of May last, in clear open weather, a rock of 36 pounds weight fell with a tremendous noise. in the vicinity of Forsyth, Geo. It sunk two feet "Revolving Timber Plane."-A machine for into the earth. The noise was heard to the disstraightening, squaring, and smoothing timber, of tance of seventy or eighty miles round, which resembled a mighty explosion .- The outer part of the rock has the appearance of having been in the fire, and when taken up, emitted a sulphurous smell. When broken, it is of a bright grayish color, mingled with some bright metallic particles. History informs us, that similar bodies have fallen from the atmosphere at different times, in the eastern, as well as in this 'continent, yet no one has been able, satisfactorily, to account for their

From the Middletown Gazette.

TO CURE OR PREVENT THE CRAMP.

This painful complaint which causes many persons to drown, when bathing or swimming, may be easily prevented by tying something round the limbs near the body, about as tight as is done to draw blood, either before going into the water or getting into bed. Or if the cramp seizes you in bed, tie something round the limb, between the pain and the body, and you will soon find relief. Sometimes I jump out on the floor and rub the parts affected, both before and after tving on the bandage. I also have a foot board, which will sometimes answer the purpose by erowding my heels against it, and raising my toes towards my body. Temperance in eating, drinking, exercise, &c., are very important in preventing a return of A CUSTOMER. this complaint.

JACOB OSGOOD'S STATEMENT.*

To the Committee on Farms-

Gentlemen-Agreeably to request, I transmit to you the following account of the management

of my farm.

The quantity of land I improve for tillage, is from fifteen to eighteen acres: about five or six for corn and potatoes; about five or six for oats and other grain: about the same quantity for winter rye. The number of acres I mow I judge to be about fifty; and the number of acres I improve for pasturing I judge to be about sixty or seventy. As to orcharding it is scattered almost all over my farm. As to making manure-in the autumn of the year, when my barn yard is cleared of all the manure made the preceeding year, we then generally haul in about forty common cart loads of earth out of the road, or from some other place, as circumstances will admit. The next spring we plough and harrow it three or four times, and continue so to do through the summer, as often as is convenient; and in the next autumn we haul it on to the land intended for planting the next year. The quantity so made, I judge to be sixty loads. My land for planting is grass land, which I plough in the autumn, carefully turning it over as smooth as possible. In the spring we harrow it three or four times, as we think necessary, then furrow and plant, after having laid nine or ten loads of longest and produces the best fodder. In good manure in the hill to an acre. I estimate my crops of corn, taking several years together, to have been from twenty-five to forty bushels to the acre; this year I think it to be forty bushels. As to spring grain, it is chiefly oats, which I use principally for fodder; and I raise of these from one hundred and fifty to three hundred bushels in a year. I sow them on the land on which I raised my corn the preceding year. When my corn is harvested, we then split the hills and harrow the ground, and then cross plough it, being careful to take the old furrows all up; then we harrow it; and in the winter and early in the spring we put on eight loads of winter dung to the aere .--When the spring opens we spread the dung and plough it in with a light furrow; then go over the ground with a light harrow lengthways of the furrows; then sow oats and other grain as we choose, with grass seed; then harrow all in to-

gether—and then lay the ground down to grass. The whole quantity of winter dung, is, I judge, about sixty loads over and above the summer and winter dung already named. I make between thirty and forty loads from sand put in my hog vard, and in a small vard separate from my barn yard, in which I yard some dry stock, when made I put it on my meadow land. My stock of neat cattle is generally about twenty-four or twenty-five head, four oxen and twelve cows, and eight or nine young cattle of different kinds and ages. I also keep two horses, and twelve sheep. As to labor, I employ one man and a boy by the year, and a man five or six weeks in hav time. In addition to the above, I inform you (according to your request) that I have made nine hundred and forty-seven rods of stone wall on my farm, principally on my plain land, and have hauled the stones to make it from a distance of half a mile to

I am, very respectfully, yours, JACOB OSGOOD.

Andover, November, 26, 1828.

N. B. The quantity of produce on my farm the present year, has not been accurately ascertained by measure; but will not vary essentially from the estimates for a series of years, as mentioned in my statement.

DAVID GRAY'S STATEMENT.

To the Committee on Farms-

GENTLEMEN-The number of acres of land that I improve as pasturage, mowing, and tillage, is about one hundred. Seventy acres of which is improved as pasturage, which is rocky, and produces a great many bushes, and the low land a considerable quantity of grass, that the cattle and horses leave, which with very little labor adds largely to my stock of manure, by putting it in my eow and hog yards. For twenty or thirty years past, I have planted on the farm about six acres with eorn and potatoes annually; and it has been my practice to put the compost manure in the hills. My winter manure I spread on the land in the spring of the year, previous to sowing it with barley, oats, grass seed, &c., and it generally produces a good erop of grass for four or five years: after the grass grows light I plough again. The grass seed that I have commonly sown are clover, herds grass, and red top; the latter holds the seasons I get from forty to fifty bushels of corn to the acre. For two or three years after the ground is laid down to grass it commonly produces two tons of hay to the acre. The manure put in the hill is from eight to ten earts full per aere. I manure about twenty acres of my farm in this way, for the purpose of raising corn, barley, oats, and hay. I now come to what I call natural mowing :-- I have of that ten acres, a large proportion of which produces good stock fodder, and has for many years. Twenty-five years since, the folder growing on this land was light and very poor; it has been made to produce good fodder at a small expense. My opinion is, that the land produces three times as much profit as it did twenty years since. This was effected by clearing the stones and bushes from the land, and by top dressing with manure once in four or five years.

STOCK.

For ten years past, I have kept on the farm, on an average, twenty-five horned eattle, and fifteen

sheep; always one, and sometimes two horses.-My stock usually consists of four oxen and eight cows, the remainder young cattle. The labor required to earry on the farm, exclusive of blasting rocks and building stone wall, is, in the summer season, three men and a boy, the remainder of the year one man and boy.

I have prepared manure for my tillage and natural mowing land, by cutting and carrying small bushes, grass, brakes, &c. into the cow and hog yards, and mixing them with the soil and wash from the sides of the road adjoining my land; as some parts of the tillage land is uneven, the lowest of which receives the wash in such abundance as to injure it, that surplus I eart into the vards in the fall of the year, that it may receive the benefit of the cattle through the winter, and the wash of the manure heaps thrown from the barn; and by these means, which are not expensive, I make a supply of manure for my tillage and grass land .--I eart out all the manure from the barn vard in the autumn, which is on an average sixty carts full. The manure in the hog yards I throw into sharp piles in the spring, and cart it on to the corn land and put it in the hill-the number of cart fulls is commonly thirty-five.

APPLE TREES.

I have set out and grafted a large number of apple trees, but have not tried any expensive experiments on them. Once in two or three years put on the body and limbs a composition of lime, salt, soap, clay, cow dung, &c., which appears to kill insects and increase the growth of the trees; and I think my trees have flourished as well as my neighbors'.

CIDER.

I have made but few experiments on cider .-My method is to put the apples in the cider house as soon as collected, and when ground to let the pomace remain in the trough from 12 to 24 hours in cool weather, before pressing it out-when I strain it and put it in the cellar a little before the fermentation is done: I bung it up tight and let it remain till used. I take care to have the mill and casks clean, and keep them so.

STONE WALL.

In making a statement of the wall that I have built within three years, I am at a loss as to the expense of it, for it has been considerable on account of removing large stones by blasting and other ways, and as in general the wall is very heavy, we have built it to appearance so as to last as long as wanted. The number of rods so built is about one hundred and sixty. Although the expense has been considerable, the satisfaction of seeing so good a fence, without the possibility of my cattle injuring my neighbors on account of poor fence; and together with the great advantage of removing those stones out of the way of the oxen, plough, scythe, and rake, has given me so much satisfaction that I have forgot the expense.

WOOD LAND.

I have about 90 acres of wood land, not included in the above statement, the largest part of Yours, &c., which is fenced. DAVID GRAY.

Andover, December 25, 1828.

(To be continued.

^{*} The following statements refer to, and should be considered as appendages of the "Report," &c., published page 249 of the current volume of the N. E. Farmer.

RAILWAYS.

[Extract from an European Magazine, Aug. 1805.]

EXTRAORDINARY FEAT OF A DRAUGHT HORSE.

An unparalleled instance of the power of a horse, The Surrey Iron Railway being completed, and opened for the carriage of goods all the way from Wandworth to Mertsham, a bet was made between two gentlemen that a common horse could draw thirty-six tons for six miles along the read. and that he should draw this weight from a dead pull, as well as turn it round the occasional windings of the read. The 24th of July was fixed on frequently the reverse owing to the seed being for the trial, when a number of gentlemen assembled near Mertsham to see this extraordinary triumph of art. Twelve wagons loaded with stones, each wagon weighing above three tons, were chained together, and a horse, taken promiscuously from the timber cart of Mr Harwood, was voked into the team. He started from near the Fox public house, and drew the immense chain of wagens with apparent ease, to near the turnnike at Croyden, a distance of six miles, in one hour and forty-one minutes, which is nearly at the rate of four miles an hour. In the course of this time he stopped four times, to show that it was not by the impetus of the descent that the power was acquired; and after each stoppage he drew off the chain of wagons from a dead rest. Having gained his wager, Mr Banks, the gentleman who laid the bet, directed four more leaded wagens to be added to the cavalcade, with which the same herse again set off with undiminished power: and still further to show the effect of the Railway in facilitating motion, he directed the attending workmen, to the number of about fifty, to mount on the wagens, when the horse proceeded without the least distress; and in truth, there appeared to be scarcely any limitation to the power of his draught. After the trial the wagons were taken to the weighing machine, and it appeared that the whole weight was as follows

CULTIVATION OF HEMP.

Hemp is considered a very hardy plant, resists drought and severe frost, is easier cultivated, less exhausting, and more profitable than many other vegetable crops. It may be grown year after during the next year a premium of ten thousand year on the same ground well manured, and has been cropped from the same ground in Eugland, seventy years in succession. The usual quantity of seed sown on an acre of middling land, should be two bushels to an acre, on very rich ground three bushels. Early sowing renders the coat heavier and stronger; the ground being covered early shades the soil and preserves the moisture. The seed having been sown as even as possible should be well harrowed, and a roller or brush their own clothes. Talking will do no good so passed over to smooth and level the ground, so that the hemp may be cut about the 1st of August; the time will be indicated by the blossom stalks becoming yellow spotted, and dropping the care and anxiety must come upon them; at all leaves; and when the wind is still, a cloud of dust events it is wise to prepare them for such contin-

to hang over the field. If allowed to stand longer, children romp and idle away all the time they the stalks of the male hemp wither, become dark are out of school, till they are fourteen or fifteen; colored, and the coat will be of little value. The and then how soon the pitiful rivalry of fashion way to secure seed for the succeeding year, is to and vanity begins! sow a patch thinly for that purpose, at the rate of when assisted by art, was shown near Croyden from half to three-fourths of a bushel to the acre, take a pleasure in their duty; they can find enbut the better way is to sow in drills or rows .- joyment in usefulness; and is it not well that they Cutting is preferable to pulling; a man will cut should find their happiness in soorces over which from half to an acre per day, but can pull only time and circumstances have no power? about a quarter of an acre; and cut hemp will bring more by the ton than pulled. In gathering the hemp it should be sorted into long and short. Fine and soft hemp is the best; the American is sowed too sparingly.

REARING OF SILK WORMS.

We have in our possession a beautiful skein of silk, spun upon the farm of Mr Enoch Boynton. of Byfield, in this county. We understand that this gentleman has about six thousand worms, and bas for the two or three last years turned his attention to the culture of silk. The valuable information on the subject of silk worms, which was disseminated by Mr Rush's Manual, prepared by order of Congress, in 1828, has led to some experiments in the rearing of Worms in our own town. The skilful superintendent of our Alms-House farm, has planted a small spot of white mulberry trees, and is now rearing one or two thousand worms, for the purpose of employing those tenants of the Alms-House who are disabled for other work. As a woman can make from twelve to fifteen pounds of raw silk, in a season of six weeks, which is worth four dollars per pound, think that the culture of this article furnishes the most profitable employment, which can be introduced into Alms-Houses. In one or two towns in Connecticut there are annually manufactured from two to three thousand pounds. In one of the counties in that State, it is said, that sewing silk answers for money as a circulating medium, in the same manner as tobacco was formerly considered in Virginia and Kentucky.

The Manual of the Secretary of State, to which we have above referred, informs us, that the first culture of silk, in this country, commenced in Virginia, by order of King James 1st. That as early as 1623, the Colonial Assembly directed the planting of mulberry trees, and in 1656 an act was passed, imposing a penalty of ten pounds of tebacco upon every planter who should fail to plant at least ten mulberry trees, for every hundred acres of his land, and in the same year, a premium of four thousand pounds of tobacco was given to a person for prosecuting the trade in silk, and pounds of tobacco was offered to any one who should export two hundred pounds worth of the raw material .- Salem Observer.

From the Massachusetts Journal.

MORE HINTS TO PEOPLE OF MODER-ATE FORTUNE.

Early teach children to take the whole care of long as their own carelessness is supplied by another's attention. Make them depend on themselves. In all probability there will be times when from the blossom stalks or male hemp will be seen | gencies. In this country we are too apt to let | e'cleck, P. M.

The fact is, children can be so educated as to

"Begin early," is the great maxim for everything in education. A child of six years old can be made useful; and they should be taught to consider each day lost, in which they have failed to do some little thing for the benefit of others .-The cager inquiries they make whether they have done any good, and the innocent and gleeful pride they evince when they receive assurance that they have, is sufficient proof that habits of usefulness are not naturally felt as a bondage.

It is wise to keep an exact account of all you expend; even to a paper of pins. This answers two purposes. It makes you more careful in spending money; and it enables your husband to judge precisely whether his family live within his income. No false pride, or foolish ambition to appear as well as others, should ever induce a person to live one cent beyond the income of which he is certain. If you have two dollars a day, let nothing but sickness induce you to spend more than nine shillings. If you have one dollar, do not spend more than seventy-five cents. If you have but half a dollar a day, be satisfied to spend

To associate with influential and genteel people. with an appearance of equality, unquestionably has its advantages; particularly where there is a family of sens and daughters coming upon the theatre of life : but, like all other external advantages, it has its proper price, and may be bought too dearly-They who never reserve a cent of their income, with which to meet any unforescen calamity, " pay too dear for their whistle," whatever temporary advantages they may derive from society."

Self denial in proportion to the narrowness of your income, will eventually be the happiest, and most respectable course for you and yours. If you are prosperous, perseverance, industry, and good character will not fail to place you in such a situation as your ambition covets; and if you are not prosperous, it will be well for your children that they have not been educated to higher hopes than they will ever realize.

Pear Trees .- It is really surprising, says a scientific writer, in allusion to the grafting of pears on a quince stock, that English gardeners should have so long neglected the practice, which has long been followed in France, and to which the excellence of the French pears is in a just degree to be attributed. The quince used as a stock has the property of stunting the growth of the pears, and forcing them to produce bearing branches instead of sterile ones, and of accelerating the maturity of the fruit. No small garden should contain pear trees grafted in any other way, nor any large garden be without them to a considerable extent .- New Monthly Mag.

A writer in the Vermont Journal recommends the use of soap suds in destroying caterpillars, and says it will kill them as quick as the flames of gun powder. Apply the suds when they are in the web, which is generally at sunrise, and at 1

New Discovery in the Preparation of Flax .- A French paper states, that an inhabitant of Chateau-Thierry, has discovered a mode of giving to prepared hemp and flax, the fineness, softness, and whiteness of cotton, by impregnating those substances with oil, and then exposing them, during fifteen or twenty days to the action of frost, between two layers of snow. By this means all the inconvenience of the ordinary and tedious process of steeping them in stagnant water will be avoided.

Silk .- The Boston Patriot states that in consequence of some little encouragement, given by the Legislature of Massachusetts to the production of silk, several persons in that State have undertaken the business. We recommend to them to procure Mr Vernon's Work on Mulberry Trees and Silk Worms, one of the best, if not altogether the best practical treatise on this subject, that has been published. It may be found at Hilliard, Gray & Co's, in Boston .- Prov. Amer.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 17, 1829.

ERRATUM-In Mr Lowell's letter to Gen. Dearborn, in the last No. of the N. E. Farmer, page 401, line 26 from the bottom of the column, the word viaticum is printed by mistake for vade mecum.

CLOSE OF THE SEVENTH VOLUME OF THE NEW ENGLAND FARMER.

We avail ourselves of the present stage in the progress of our labors to proffer our gratitude to the public in general, and to tender our best acknowledgments to patrons and correspondents in particular, for past kindness, and to solicit the continuance of future favors. It is now seven years since the commencement of the New England Farmer; during which period we have labored with more zeal than ability, with more industry than talents, to diffuse that knowledge which is is life to the Horticulturist.

Though we may not boast of having heralded or accomplished any very great improvements in the arts to which our paper is devoted still, well meant endeavors to be useful, even if not always well directed, are rarely wholly inefficient. We claim no other merit for personal exertions than what is due to some share of industry, and good intentions. But, we think the New England Farmer, with the aid of its intelligent and patriotic correspondents, has served as a focus to condense, and a reflector to distribute those rays of profitable intelligence, every beam of which indicates sources of wealth of more value to the country than all the gold of Carolina. Our columns may also be compared to chandeliers, furnished by our correspondents with the lights of science, so disposed that mankind may derive extensive and permanent benefits from their radiations.

Farmers and gardeners appear to appreciate higher than formerly the benefits derivative from a publication like ours; a work not merely filled to allure the transient glance of idle curiosity, but to excite and reward the patient and persevering search for utility-a work printed in periodical numbers, not merely of temporary use and amusement, but furnishing a series of volumes, to be

seasons may call for its essays and prescriptions, earth to receive the products of the decomposi-

regard to Horticulture, and the acquisitions which | manure. are continually rewarding enlightened efforts to improve that art, render a journal like ours, at least in part devoted to gardening almost indispensable. "Gardening," said Dr Deane, "is a ed by the most splendid exhibition of flowers ever kind of agriculture. It may be considered as farm- witnessed in New York. Of the magnificent caring in miniature. It is conversant in preparing nation, which sports in such innumerable varieground for different kinds of seeds, and in treating them properly during their growth. The garden is the fittest place to make the first experiments in, with exotic roots and seeds, as the loss the catalogue of our garden products is indebted is inconsiderable if they should not prove agreeable to the climate." From intelligent and patriotic horticulturists we may anticipate not only new kinds of vegetables, but improved seeds, roots, scions, &c. of the kinds already in cultivation. But it is not necessary to particularize advantages already generally known and highly appreciated.

The close of a volume forms a sort of an epoch in the financial concerns of our office, and payments now made of sums due for our paper, would not only comport with our convenience but minis- filamentosa, a North American plant, with a spike ter to our necessities, and serve, as it were, for an- of flowers seven feet four inches in length. ti-friction rollers to the wheels of our establishment. We hope that this intimation will be sufficient, and superscde the necessity of that importunity, which is as disagreeable to us as it would be to those to whom such solicitations, in cases of continued delinquency, must be directed.

The following has been often published, but may be new to some, who might derive advantage

A method to preserve Cheese from Mites .- Take a pod of red pepper and put it into a piece of fine linen; moisten it with a little butter, and rub your cheese frequently. It not only gives a fine color to cheese, but is so pungent that no fly will come near it.

Green Vegetables for Manure .- No good farmer power to the Husbandman, and that light which or gardener will permit, when he can well avoid it, weeds, nor indeed any other vegetable or animal matter to dry or rot above ground. In hoeing corn, it is better to bury the weeds as you proceed than leave them on the top of the ground .-In gardening, when you have collected a mass of weeds, throw over them a sufficient quantity of soil to keep them from the air, and absorb the products of their decomposition. Make small heaps of weeds in balks or alleys, and cover them with earth, and in a short time they will give you beds of compost manure. Green fern [brakes] is recommended by Mr Knight as very useful for this purpose, as they contain more fertilizing matter, or food for plants, than most vegetables. Mr Knight says, "any given quantity of vegetable matter can, generally, be employed in its recent and organized state with much prore advantage than when it has been decomposed, and no inconsiderable part of its component part; has been dissipated and lost during the progress of the putrefactive fermentation." If this ferme utation proceeds when the vegetables are covered ' with earth, or some substance, which will receive and retain its gaseous matter, and this substance e is afterwards applied to the soil which it is wished to manure there is little if any waste. P. erhaps it jelly may be made in the same manner, and with would be well to place green weeds in small the same proportion of loaf sugar. wies of the hours thow a little quick lime over them to

cultivator's art, and the requirements of revolving hasten their dissolution, and cover the whole with The spirit which has recently been excited with tion, and thus the whole mass would make good

> Horticultural .- At the last meeting of the New York Horticultural Society, the visitors were gratifities, upwards of 100 distinct sorts were brought forward, mostly from the Linnean Garden of WM PRINCE, of Flushing, to whose skill and enterprise for some of its most valuable specimens. The gooseberries exhibited were very superior, twelve of which weighed five ounces-several splendid plants from Mr Wilson's garden-ripe Apricots measuring six inches in circumference-also, fine specimens of Antwerp, and Brentford Raspberries -Knivet's New Pine Strawberry-the Scuppernong, Texas, and Long's Arkansas Grapes-Salsafy-and between one and two hundred different sorts of flowers, native, and exotic, from WM PRINCE's Garden, among which was the Yucca

Mr Samuel Pond, of Cambridge, exhibited at the Hall of the Massachusetts Horticultural Society. on Saturday, the 11th inst, some of the largest and finest Early Potatoes that have been seen in our market this season. They were raised from the ball four years since, by Mr Solomon Per-KINS, of Bridgewater. This kind will prove a valuable sort for our market gardeners, from its earliness and productive quality-sixteen hills vielding five pecks, at this early part of the season. Some very fine specimens of Siberian Spirea, and seedling Carnations, &c., were exhibited by the Messrs WINSHIPS, of Brighton-Mr Downer brought forward a specimen of Scuppernong wine, from North Carolina, with fine specimens of Mexican Dahlias, late Roses, and his late Mazard Cherry.

Seeds .- In the proceedings of the Horticultural Society of London, there is an account of two air tight hogsheads of bright looking seeds, whose vegetating principle had been destroyed by the heat of the stagnant air in the hole of a vessel .-Seeds from the same Seedsman, kept in the trunks of passengers in the same vessel, vegetated remarkably well.

[From "Seventy-Five Receipts," a valuable little work, for sale at this office.]

RED CURRANT JELLY.

Wash your currents, drain them, and pick them from the stalks. Mash them with the back of a spoon. Put them in a jelly-bag, and squeeze it till all the inice is pressed out.

To every pint of juice, allow a pound of the best loaf sugar. Put the juice and the sugar into your kettle, and boil it fifteen minutes, skimming it all the while. Pour it warm into your glasses. set it for several hours in the sun, and when cold. tie it up with brandy paper. Jellies should never be allowed to get cold in the kettle. If boiled too long, they will lose their flavor, and become of a dark color.

Strawberry, raspberry, blackberry, and grape

Red current jelly may also be made in a very

simple manner, by putting the currants whole into the kettle, with the sugar; allowing a pound of sugar to a pound of currants. Boil them together fifteen minutes, skimming carefully. pour them into a sieve, with a pan under it. Let them drain through the sieve into the pan, pressing them down with the back of a spoon.

Take the jelly, while warm, out of the pan, and Wheeling. put it into your glasses. Tie it up with brandy

paper when cold.

PRESERVED STRAWBERRIES.

Weigh the strawberries after you have nicked off the stems. To each pound of fruit allow a pound of loaf sugar, which must be powdered .-Strew half of the sugar over the strawberries, and let them stand in a cold place two or three hours. Then put them in a preserving kettle over a slow fire, and by degrees strew on the rest of the sugar. Boil them fifteen or twenty minutes, and skim them well.

Put them in wide mouthed bottles, and when cold, seal the corks.

If you wish to do them whole, take them carefully out of the syrup, (one at a time) while boiling. Spread them to cool on large dishes, not letting the strawberries touch each other, and when cool, return them to the syrup, and boil them a little longer. Repeat this several times.

Keep the bottles in dry sand, in a place that is cool and not dann.

Gooseberries, currants, raspberries, cherries and grapes may be done in the same manner. The stones must be taken from the cherries (which should be morellas, or the largest and best red cherries) and the seeds should be extracted from the grapes with the sharp point of a penknife .-Gooseberries, grapes, and cherrics, require longer boiling than strawberries, raspberries, or currants.

RASPBERRY JAM.

Allow a pound of sugar to a pound of fruit .-Mash the raspberries, and put them with the sugar into your preserving kettle. Boil it slowly for an hour, skimming it well. Tie it up with brandy paper.

All jams are made in the same manner.

The Melodium .- Our readers are already aware that Mr Maelzel is now exhibiting at the Diorama in Broadway, his "Melodium." It is somewhat smaller in size than a church organ, and has been pronounced by Europeans, the finest instrument of the kind in the world. Its compass and powers are really astonishing. Some of its notes are so delicate as scarcely to exceed the warblings of small singing birds; others can be made so loud as to shake the very building in which it stands. Grandeur and solemnity, delicacy and harmony, are the characteristics of the Melodium .- Cour. & . Enq.

Anti Societies .- The fashion of forming anti socicties has gone so far, that in one place we are told of an "Anti-going-to-sleep-with-a-candleburning Society," organized for the purpose of stopping the practice of reading in bed by candle light. In New York, it is proposed to establish a society, to check the practice of drinking cold water in hot weather. It is to bear the harmonious title of "Anti-drinking-too-much-cold-water-ina-hot-day Society."-Salem Obs.

A mercantile establishment at Zanesville, Ohio, has advertised for sale, a quantity of " Temperance Scythes, and Sickles," which are warranted to "cut well without the aid of Whiskey." These are very valuable articles, and we take pleasure in informing the public that they can be had at most of the stores in our sober and industrious town of

.1 Reward offered .- A reward of \$5 is offered by a gentlemen in Newburgh, through the colunns of the Newburgh Gazette, to the lady who will wear the smallest hat in church for the next six months. The object is laudable.-Hudson

The New York Police committee are shortly to report a standard measure by which vegetables are bereafter to be sold in the markets of that

Powder at 2s per lb.

DUPONT'S POWDER, quality warranted, for sale at Copedand's Ammunition Store, 65 Broad st, at retail. Also, SHOT, CAPS, &c. of the best quality—cheap for cash.

English Scythes,

James Cam's double prime grass scythes, wide and narrow, a superior article, for sale at the Hardware Store of S. FES-SENDEN, No. 30 State Street. St. Jame 19

Buckwheat, &c.

For sale at the Seed Store connected with the New Eng For sale at the Seed Store connected with the New England Farmer, No. 52 North Market Street,
A few bushels of Buckwheat, growth of 1928. Also, a further supply of Fowl Meadow Grass Seed, of superior quality.

New China Tea Sets, and light blue Dinner Ware. Received, a great variety of the above; which, with a complete assortment of Crockery, China, and Glass Ware, are ofered for sale, low, at No. 4 Dock Square.

Turnin Seed.

For sale at the Seed Store connected with the New

For sale at the Seed Store connected with the New England Farmer, 62 North Market Street, 50) lbs. fine White Plat English Turmp Seed, growth 629—also, Several other approved varieties from Scottand, and London, among which the Early Dutch, Yellow Stone, and Yeslow Malta, have proved of very superior quality for the table,—and the Yellow Aberdeen, (or Bullock,) and the Large Norfolk Field Turnip for cattle.

Gault's Churns.

[Extract of a letter to Mr J. R. Newell, Proprietor of the Ag-icultural Warehouse, No. 52 North Market street.]

SIR-In answer to your inquiry respecting the churns, known by the name of Gault's Churns, I give it as my opinion that they are the best calculated, the most convenient, and the easiest to bring butter of any I have ever met with. It is not thought a hard task to fetch the butter, with one of them, in fifinought a naro task to teren the obtter, with one of them, in lifteen minutes. It cost me six dollars, and was bought at the Agricultural Warehouse, 52 North Market street. I should refuse thirty dollars for it, if I could not obtain another of the same

Respectfully yours.
B. REYNOLDS. Sharon, June 15, 1829.

Salt Grass at Auction.

The standing grass on 171.2 acres of salt marsh, adjaining the upland of Zehedee Cook, Jr. in Dorchester, one half mile south of the Toll House on the Dorchester Turnpike, lying east

south of the Toll House on the Dorenester Turnpixe, lying east of the same, will be sold at public auction on Monday the 20th inst, on the premises, at 4 o'clock in the afternoon.

No better opportunity can be afforded to those desirous of furnishing themselves with a superior quality of salt grass than that now offered. The Language of the Company that now offered. Darchester, July 15, 1829.

Alderney Bull For Sale.

A full blood Alderney Bull, seven years old, well made, and sure; he is a very superior animal, independent of his blood, and his calves have proved good milkers, having all the desirable dairy qualities. Price of the bull \$100. Inquire at the New England Farmer office.

Short Horn Bull Calf Wanted.

A fair price will be given for a first rate, warranted Short Horn Durham Bull Calf, togo to Concord, Mass. Inquire of J. B. Russell, publisher of the New England Farmer (post

Gardener wants a Situation.

A gardener, we has a complete knowledge of his business, and can produce recommendations from the Botanie Committee of the Dublin Royal Society, (having been employed in their Botanic Garden for two years, and from many gentlemen in the vicinity of Diblin, washes to procure a situation in this country. Inquire at the New England Farmer office.

Millet Seed.

For sale at the Seed Store connected with the New England

For sale at the Seof Store connected with the New England Farmer, No. 52 North Market street.

30 Inshels of Millet Serd,—tean, and of superior quality.

Also, a very extensive variety of Ornamental Llower Secfs, in papers of 6 cts each, or 199 varieties, one paper each, for \$5.09.

ROMAN—This elegant, bill blooded horse, a bright bay, with black legs, mane, and tail, of high spirit and good temper, will stand at the farm of Mr Stephen Williams, in Northborough, Ms, at \$20 the season, to be paid before the mares are taken away.—See New England Farmer, May 15.

Imported Horses.

Barcfoot, and Cleveland, the two English horses, will stand for the season at their stable in Brighton. Barcfoot at \$25, and Cleveland at \$10, with \$1 for the groom. a24

Heifers, Calves, Sheep, &c.

For sale, two full blood Alderney Heiters, three spring, with east by a full blood bull of the Short Horn breed; one Alderney Herfer calf, six months old, weared, and turned one America' Dedict call, ax monitors on, weared, and turned to grass; two full blood being realizes of the Short Horn breed, two months old, now at grass feed; four of the Lorg Wool Ewes, imported from the Netherlands; a back lamb from one of the ewes, and a Devonshire Buck, a very fine animal, and four full blood Saxous Bucks. For terms apply at this office. June 17, 1829.

MISCELLANIES.

From Shaw's Naturalist's Miscellany.

TRANSFORMATION OF THE CATERPIL.

The helpless crawling caterpillar trace From the first period of his reptile race. Clothed in dishonor, on the leafy spray Unseen he wears his silent bours away; Till satiate grown of all that life supplies, Self-taught the voluntary martyr dies. Deep under earth his darkling course he bends, And to the tomb a willing guest descends. There, long secluded, in his lonely cell, Forgets the sun, and bids the world farewell. O'er the wide waste the wintry tempests reign, And driving snows usurp the frozen plain : In vain the tempest beats, the whirlwind blows, No storms can violate his grave's repose. But when revolving months have won their way, When smile the woods, and when the zephyrs play, When laughs the vivid world in summer's bloom, He bursts and flies triumphant from the tomb, And, while his new born beauties he displays, With conscious joy his altered form surveys. Mark, while he moves amid the sunny beam, O'er his soft wings the varying lustre gleam. Launched into air, on purple plumes he soars, Gay nature's face with wanton glance explores; Proud of his various beauties, wings his way, And robs fair flowers, himself more fair than they. And deems weak man the future promise vain When worms can die, and glorious live again?

The following extracts are taken either verbatim or in substance, from a valuable English work, entitled "Domestic Duties; or Instructions to Young Married Ladies, on the Management of the Household, and the Regulation of their Conduct in the various Relations and Duties of Married Life." By Mrs William Parkes. Printed by J. & J. Harper, New York .- ED.

Buring and Selling .- In purchasing articles of merchandise nothing more ought to be attempted than a fair exchange of commodity for specie .-The habit of asking one price and accepting another deserves reprobation. The seller is unjust to himself if he permit the buyer to purchase from him at too low a rate, and unjust to the buyer if he require from him more than the goods are worth.

Bargains and Shopping .- Those who are fond of bargains, lose more time in hunting after them than the difference of the price in the articles they purchase can compensate, were even the principle on which they act a proper one. This ranging from shop to shop has given origin to a fashionable method of killing time, which is termed shopping, and is in truth a mean and unwarrantable amusement, at the expense of the tradesmen and shop keepers who are subject to it.

How to remove spots and stains from silks and woollen cloths .- If gentle rubbing with white paper will not remove them from silk, a little French chalk, scraped and rubbed into them, will, with the aid of friction, generally remove them; but this is apt to leave a dull appearance on the silk. Spirits of turpentine would remove grease spots better than French chalk, if its strong smell were not an objection. Hartshorn will remove spots of

grease spots, will be found to effectually remove them from woollen. Sometimes the droppings of nothing. wax lights are very troublesome to remove from coats and velvets. Spirits of wine will dissolve the wax, but as in some cases it may affect the color, it is recommended to try a very simple mode, which is to toast the crumb of a small piece of bread, and while hot apply it to the droppings of wax, a portion of which it will dissolve and imbibe, and by repeating this simple process several successive times, the whole wax will be gradually removed.

Preservation of Furs and Woollens .- Furs. and woollens should not be laid by for the summer months without having the dust well shaken out na, it appears that in the city and suburbs of of them, and care taken that they are quite free from damp; for dust and moisture are the great lation since 1819, of between six and seven hunfoes to be guarded against in the first instance as dred-the number in 1819 being 17.706, and at tending to the increase of moths and insects .-Many things are used as preventives against the most entire desertion of the upper part of King inroads of moths; such as sprinkling furs and street, a section of the district which was exceedwoollens with spirits of turpentine; putting camphor, pepper corns, cedar shavings, and Russian the last census was taken. In the country parleather among them; * but I believe the best plan, ishes there has generally been an increase. after all, is to sew the furs up in linen, well aired, through which the moth cannot penetrate; and once or twice in the course of the summer, to have them taken out on fine sunny days, and after being well shaken replaced in their envelopes and the payment of his debts—the property was found nut aside.

Our incomes should be like our shoes, if too small they will gall and pinch us; but if too large, they will cause us to stumble and to trip .-But wealth, after all, is a relative thing; since he that has little and wants less, is richer than he that has much and wants more. The contentment de- ing doubtless from inhaling the poisonous fumes pends not upon what we have, but upon what we would have; a tub was large enough for Diogenes, but a world was too little for Alexan-

Maxims .- The best thing to be done when adversity pinehes, is, not to sit down and ery, but to rise up and work.

Seeking the welfare of man is goodness-of all virtues the greatest-because it is aiming to imitate God.

No man ever did a purposed injury to another, without doing a greater to himself. Whatever is worth doing at all is worth doing

well; but it is impossible to do anything well without attention.

Almost all our desires are apt to wander into an improper course; but care will render us safe and happy through life.

Avoid all harshness in behaviour; treat every one with that courtesy which springs from a mild and gentle heart.

He pays dear for his bread who lives by another's bounty.

There is no cause of misery more fruitful than incurring expenses that we cannot afford.

One ounce of practice is better than a pound of Get good sense, and you will not want good

He who hopes for glory by new discoveries,

must not be ignorant of old ones.

Levity would change everything, pertinacity

He who cannot live contented anywhere, will ve contented nowhere.

Light things will agitate little minds.

Reading makes the mind full, writing accurate. and conversation ready.

A studious life wins longevity.

Opinions are estimated by their truth, preferences by their propriety.

From the same bud the bee sucks honey and the spider poison.

By the census recently taken in South Caroli-Charleston, there is a decrease in the white popupresent 17,202. The reason assigned is the alingly populons and thriving at the period when

Poisonous Effects of White Lead .- A man of this county "ran off" his moveable property, consisting of eight negroes and three horses, to avoid in South Carolina, attached, and the negroes for safe keeping were confined in the jail of Abbeville District. While in close confinement, the inside of the jail was painted with white lead, which caused in about ten days, the death of four of the negroes, the most likely and valuable of the numof the fresh painted room .- Georgia pa.

Milk .- It is singular (says Mr Crawford) that the Cochin Chinese, who are in general indiscriminate, and even gross, in their diet, have an anfipathy to milk, amounting to loathing. They insist that the practice of using it as food is little better than that of drinking raw blood.

Tall Meadow Oat Grass Seed.

This day received at the New England Farmer Seed Store, 52 North Market street, 20 bushels of Tall Meadow Out Grass

52 North Market street, 20 business of 1 an meadow Out Grass Seed, at 82,50 per bushel. Also, White Mulberry Seed, 50 els per ounce, Lucerne, or French Clover, White and Red Clover, Sanfoin, Timothy, Orchard Grass, Oat Grass, Herds Grass, &c.

Agricultural Books.

The third edition of Fessenden's New American Gar. dener; this work has been pronounced by the most ju-dicious horticulturists in New England and the middle states, to be the best treatise on Fruit Trees, Vegetables. Grape Vines, &c., to be found in this country-price
